KEY TO PRONUNCIATION

For a full explanation of the various sounds indicated, see the KEY TO PRONUNCIATION in Vol. I.

ā as in ale, fate.
 â " " senate, chaotic.
 â " " glare, care, and as *e* in there.
 ă " " am, at.
 ä " " arm, father.
 á " " ant, and final *a* in America, armada, etc.
 α " " final, regal, pleasant.
 a " " all, fall.
 æ " " eve.
 ē " " elate, evade.
 ẽ " " end, pet.
 ẽ " " fern, her, and as *i* in sir, etc.
 ẽ " " agency, judgment.
 ẽ " " ice, quiet.
 ẽ " " quiescent.
 ẽ " " ill, fit.
 ẽ " " old, sober.
 ẽ " " obey, sobriety.
 ẽ " " orb, nor.
 ẽ " " odd, forest, not.
 ẽ " " atom, carol.
 ẽ " " oil, boil.
 ẽ " " food, fool, and as *u* in rude, rule.
 ou " " house, mouse.
 ū " " use, mule.
 ū " " unite.
 ẽ " " cut, but.
 ū " " full, put, or as *oo* in foot, book.
 ū " " urn, burn.
 y " " yet, yield.
 B " " Spanish Habana, Córdoba, where it is like English *v* but made with the lips alone.

ch as in chair, cheese.
 d " " Spanish Almodovar, pulgada, where it is nearly like *th* in English then.
 g " " go, get.
 G " " German Landtag = *ch* in Ger. ach, etc.
 H " " *j* in Spanish Jijona, *g* in Spanish gila; like English *h* in hue, but stronger.
 hw " " *wh* in which.
 K " " *ch* in German ich, Albrecht = *g* in German Arensburg, Mecklenburg, etc.
 n " " in sinker, longer.
 ng " " sing, long.
 N " " French bon, Bourbon, and *m* in the French Étampes; here it indicates nasalizing of the preceding vowel.
 sh " " shine, shut.
 th " " thrust, thin.
 TH " " then, this.
 zh " " *z* in azure, and *s* in pleasure.

An apostrophe ['] is sometimes used as in tã'b'l (table), kãz'm (chasm), to indicate the elision of a vowel or its reduction to a mere murmur.

For foreign sounds, the nearest English equivalent is generally used. In any case where a special symbol, as G, H, K, N, is used, those unfamiliar with the foreign sound indicated may substitute the English sound ordinarily indicated by the letter. For a full description of all such sounds, see the article on PRONUNCIATION.

A PARTIAL LIST OF THE LEADING ARTICLES IN VOLUME XXII

TASMANIA.

Professor Robert M. Brown; Mr. Edward L. Engle; Dr. Robert H. Lowie; Mr. Irwin Scofield Guernsey; Professor J. Salwyn Schapiro.

TASSO, T.

Professor Albert Arthur Livingston.

TAX AND TAXATION.

Professor Alvin Saunders Johnson.
Dr. Roland P. Falkner.

TAXONOMY.

Professor John Merle Coulter.

TCHAIKOVSKY.

Professor Alfred Remy.

TEA.

Dr. Edwin West Allen.

TECHNICAL EDUCATION.

Professor Paul Monroe.
Professor Isaac Leon Kandel.

TELEGRAPH.

Professor Morton Arendt.

TELEGRAPHY, SUBMARINE.

Mr. Moses Nelson Baker; Mr. Herbert Treadwell Wade; Professor Morton Arendt.

TELEPHONE.

Professor Morton Arendt.

TELESCOPE.

Mr. Herbert Treadwell Wade.

TEMPERANCE.

Professor Samuel McCune Lindsay;
Professor Alvin Saunders Johnson;
Mr. John W. Russell.

TEMPLE AT JERUSALEM.

Professor Nathaniel Schmidt.
Professor A. D. F. Hamlin.

TENNESSEE.

Professor L. C. Glenn; Mr. Allen Leon Churchill; Professor Alvin Saunders Johnson; Mr. Oscar Phelps Austin; Mr. Charles Vernon Katz; Honorable John M. Meloon.

TERRESTRIAL ELECTRICITY.

Dr. L. A. Bauer.
Mr. W. F. G. Swann.

TERRESTRIAL MAGNETISM.

Dr. L. A. Bauer.

TEUTONIC LANGUAGES.

Professor Maurice Bloomfield.
Professor John Lawrence Gerig.

TEXAS.

Mr. J. A. Udden; Mr. Roland M. Harper; Mr. Allen Leon Churchill; Mr. Charles Vernon Katz; Professor Alvin Saunders Johnson; Honorable H. W. Dougherty.

TEXTILE MANUFACTURING.

Mrs. Ellen B. McGowan.

TEXTILE PRINTING.

Mr. George Leland Hunter.

TEXTUAL CRITICISM.

Professor Mortimer L. Earle.
Professor Charles Knapp.

THEATRE.

Mr. Philip G. Hubert, Jr.; Mr. John Daniel Kaps; Professor James Morton Paton; Professor Charles Knapp; Dr. Dudley H. Miles; Mr. H. H. Hughes; Mr. Hiram Kelly Moderwell; Mr. Harold R. Medina; Professor A. D. F. Hamlin.

THEISM.

Dr. Henry A. Davies.
Professor Irving Francis Wood.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

TARTAGLIA, tär-tä'lyä, Nicoló (1500-1557). An Italian physicist and arithmetician whose real name was Nicoló Fontana. He was born at Brescia, lectured at Verona, and became professor of mathematics at Venice. Tartaglia first became generally known through his solution of cubic equations, and from his suggestions Cardan (q.v.) probably derived the solution known as Cardan's method. His work in physics is preserved in his *Nuova scienza* (1537; French trans., 1845-46), showing that he studied the theory of falling bodies and investigated the range of projectiles at various angles. His treatise on arithmetic, *General trattato de numeri et misure* (1556-60), is the chief authority on the Italian methods of his time. *Quesiti et inventioni dierse de Nicoló Tartaglia* (1546) is also well known.

TAR'TAK. According to 2 Kings xvii. 31, the name given to a deity worshiped by the Avites, who were transferred to Samaria by the Assyrian King after the destruction of the northern Hebrew Kingdom. Jewish tradition represents Tartak as worshiped under the form of an ass (*Tal. Bab., Sanhedrin* 63). No such deity as Tartak has been found in the Babylonian or Assyrian literature, but it is possible that Tartahu is meant, which is a name of Ninib.

TAR'TAN (possibly Fr. *tiretaine*, *tirtaine*, linsey-woolsey, from Sp. *tiritaña*, thin silk or woolen cloth). A well-known cloth of checkered pattern, also called plaid. The Scottish Gaelic tartan is a loan word from the English; the native name is rather breacan. These colored plaids have long been in great favor in the Highlands of Scotland, where each clan has its distinctive pattern. Consult James Grant, *Tartans of the Clans of Scotland* (Edinburgh, 1886), and C. N. North, *Leabhar communnam fìor Chael, Book of the Club of True Highlanders* (2 vols., London, 1892).

TAR'TAR (ML. *tartorum*, MGk. *τάρταρος*, tartar, probably from Lat. *Tartarus*, from Gk. *Tártaros*, Tartarus, Hades). A mixture of bitartrate of potash and tartrate of lime, deposited from wine and known in its crude form as argol or lees. (See ARGOL.) In dentistry, a deposit upon the teeth, consisting mostly of calcium phosphate.

TARTAR EMETIC. A name applied to the double tartrate of potassium and antimony,

$K(SbO)C_4H_4O_6 + \frac{1}{2}H_2O$. It is prepared by making a paste of antimonious oxide, acid potassium tartrate and a little water, allowing to stand for several hours, then boiling the paste with water, and allowing the resulting solution to crystallize. Tartar emetic has a sweet taste, but leaves a disagreeable aftertaste in the mouth. It is moderately soluble in water, but is insoluble in alcohol. It has an irritating effect on the alimentary canal, and causes vomiting; but vomiting is also due to its action upon the medulla, after absorption into the blood. Owing chiefly to its depressing effect on the heart and the nervous system, it is now little used.

TARTARIC (tär-tär'ik) **ACID**, $C_4H_4O_6$. An acid compound of carbon, hydrogen, and oxygen, of which four different modifications are known. Ordinary tartaric acid is usually seen in the form of colorless, transparent crystals, which are not affected by the action of the air, have an agreeable acid taste, and are soluble in water and alcohol. The crystals when gently warmed become strongly electric, the opposite sides of the crystals becoming charged with the opposite forms of electricity. On heating tartaric acid to about 169° C. (336° F.), it fuses; and at slightly higher temperatures it becomes changed into metatartaric, tartralic, and tartronic acids, substances of still unknown constitution.

Tartaric acid occurs abundantly in the vegetable kingdom both free and combined. It is from argol (q.v.), a product of grape-juice fermentation, that the tartaric acid of commerce is obtained. Argol, or crude tartar, is boiled with water and hydrochloric acid, and the solution precipitated with lime. The insoluble tartrate of calcium thus obtained is purified by washing with water, then decomposed by treating with sulphuric acid. This transforms the tartrate into the sparingly soluble calcium sulphate, while tartaric acid goes into solution in the free state. The filtered liquid, when cooled and evaporated, yields crystalline tartaric acid. Tartaric acid is used in the manufacture of baking powders and of certain dyestuffs, in dyeing and calico printing, in photography, and in pharmacy.

Being a dibasic acid, tartaric acid can form both acid and neutral salts. The most important tartrates are the following: Neutral potassium tartrate, $K_2C_4H_4O_6$, a soluble salt which crystallizes with half a molecule of water. Acid potassium tartrate, or bitartrate of potash,

$\text{KHC}_4\text{H}_4\text{O}_6$, is prepared from argol by extraction with boiling water and filtering the solution thus obtained through charcoal. The salt crystallizes readily as the hot solution cools. The snowy white rhombic prisms thus deposited constitute cream of tartar, which is moderately soluble in cold water and less soluble in alcohol. It is an excellent saline purgative and diuretic and is largely used in medicine. Calcium tartrate, $\text{CaC}_4\text{H}_4\text{O}_6 + 4\text{H}_2\text{O}$, is practically insoluble in cold water and slightly soluble in hot water. The insolubility of the acid tartrate of potassium and of the tartrate of calcium often helps to identify tartaric acid. Tartar emetic is described above.

Tartaric acid was early known in the form of tartar; Scheele was the first to obtain the acid in the free state and to determine its principal properties (1769). Like other acids, tartaric acid promotes secretion of saliva, and may be used to allay thirst. When taken internally it is decomposed in the blood with formation of alkaline carbonates, which cause an increase of the alkalinity of urine.

A remarkable modification of tartaric acid is known as racemic acid ($\text{C}_4\text{H}_4\text{O}_6$) $_2$ $\cdot 2\text{H}_2\text{O}$. It is a frequent associate of tartaric acid, but is especially abundant in the grapes of the Vosges district. While it exhibits a close resemblance to tartaric acid, it crystallizes more readily from solution; contains two equivalents of water of crystallization; is less soluble in alcohol; and the racemate of lime is soluble in hydrochloric acid, and is precipitated unchanged on adding ammonia. Its most important difference, however, is that its solution does not rotate the plane of polarized light, while a solution of ordinary tartaric acid exerts a well-marked right-handed rotation. Pasteur proved that racemic acid is a combination of ordinary tartaric acid (to which, from its optical property, he applies the term "dextroracemic acid") and of an acid which produces left-handed rotation, to which he gives the name "lavoracemic acid." (These acids are at present generally referred to as dextro-tartaric and levotartaric acids.) He found that, by saturating racemic acid with soda and ammonia, and allowing this solution to crystallize at the temperature of the laboratory, two varieties of crystals are obtained, which differ from one another in the same way as a right-hand glove and a left-hand glove, or as any unsymmetrical object differs from its own mirror image. If the two kinds of crystals are separated, and then dissolved, each solution is found to act powerfully on polarized light, but in opposite directions. On separating the free acid from each of the two solutions, and mixing equal parts of concentrated solutions of these acids, racemic acid is again formed, which exerts no action on a polarized ray.

Besides the three modifications mentioned above, viz., ordinary or dextrotartaric acid, levotartaric acid, and racemic acid, a fourth modification of the same chemical composition and constitution, known as mesotartaric, anti-tartaric, or inactive tartaric acid, has been obtained. It may best be prepared by boiling tartaric acid with a strong solution of caustic potash. In the anhydrous state mesotartaric acid melts at about 140°C . (284°F .); usually, however, it is obtained in the form of crystals having the composition $\text{C}_4\text{H}_4\text{O}_6 \cdot \text{H}_2\text{O}$. It is very soluble in water. Its acid potassium salt, too, is very soluble in water, and its calcium

salt crystallizes with 3 molecules of water: $\text{CaC}_4\text{H}_4\text{O}_6 \cdot 3\text{H}_2\text{O}$. The different modifications of tartaric acid have also been prepared synthetically. Their relation to one another has been explained stereochemically. See STEREOCHEMISTRY.

TARTARIN, tär'tä'rän'. The hero of three tales by Alphonse Daudet, *Tartarin of Tarascon* (1872), *Tartarin on the Alps* (1885), and *Port-Tarascon* (1890).

TARTARS, tär'tarz. See TATARS.

TARTARUS (Lat., from Gk. *Tárapos*). According to Homer, a deep and sunless abyss, as far below Hades as earth is below heaven, and closed in by iron gates. Into Tartarus Zeus hurled those who rebelled against his authority, e.g., Cronos and the Titans. It is to be noted that such sinners as Tityos, who offered violence to Leto, and after his death by the arrows of Apollo and Artemis was condemned to have his liver perpetually eaten by vultures, or Sisyphus (q.v.), Tantalus (q.v.), and Ixion (q.v.) are represented in the earlier poems as suffering in sight of the other shades. Later, when the idea of a judgment in the other world and a separation between the good and the bad had become well developed, Tartarus became the place of punishment for all sinners.

TARTARY (properly *Tatary*). The name which, in the Middle Ages, was applied to the central part of Eurasia. In later times a distinction was made between European and Asiatic Tartary, the former comprising that part of Russia which was once the Khanate of the Crimea. The term Asiatic Tartary, first applied to the whole of Central Asia, has gradually been confined to Turkestan.

TARTE, tärt, JOSEPH ISRAEL (1848-1909). A Canadian statesman. He was born in the Province of Quebec, was educated at L'Assomption College, and was admitted to the bar in 1871. Afterward he became editor of *Le Canadien* and then of *L'Événement*, in Quebec. Politically he was a Conservative until 1891, but after that he supported the Liberals. He was a member of the Legislative Assembly of Quebec in 1877-81, and became an active political organizer of his party in that province. As the avowed foe of corruption, he had given dissatisfaction by criticism of certain politicians and measures; but after his election to the Dominion House of Commons in 1891, as an Independent Conservative, he attacked the administration of Sir John A. Macdonald, his political chief, alleging corrupt practices by ministers. This compelled him to leave the Conservative party, and when the Laurier administration came into power in 1896 he was appointed Minister of Public Works. He held that position until 1902. He was afterward political editor of *La Patrie* of Montreal.

TARTINI, tär-tě'ně, GIUSEPPE (1692-1770). An Italian violinist, composer, and theoretician, born at Pirano; Istria. He discovered the combination tones, about 1714, and used them in making perfect purity of intonation. His fame rapidly increased and in 1721 he was made solo violinist and conductor of the orchestra at Sant' Antonio in Padua. From 1723 to 1725 he was chamber musician to Count Kinsky at Prague. Afterward he again took up his duties at Padua and founded a violin school there in 1728, which acquired a world-wide reputation. His compositions include numerous classical concertos, sonatas, and other compositions for the violin, and

the best known of his theoretical works are: *Trattato di musica secondo la vera scienza dell' armonia* (1754); *De' principj dell' armonia musicale contenuta nel diatonico genere* (1767); and *L'arte dell' arco*, reprinted in Choron, *Principes de composition*, vol. vi (Paris, 1816). Consult Fayolle, *Notices sur Corelli, Tartini, etc.* (Paris, 1810).

TARTUFE, tār'tuf', or **TARTUFFE**. The name of Molière's most celebrated comedy and of the chief character in it, who has become the type in all languages for a hypocritical scoundrel carrying out his evil designs under the cloak of religion. In the play Tartufe ingratiates himself with a simple-minded gentleman named Orgon, and nearly ruins both him and his family before being discovered. The name is said to have suggested itself to Molière on the occasion of a visit to the Papal Nuncio, where he saw the pious and solemn countenances of the Nuncio's courtiers suddenly lighted up with ecstatic animation by the appearance of a seller of truffles—in Italian, tartuffoli. The play was written in 1664, presented once in 1667, then prohibited, and it was not until 1669 that Molière succeeded finally in getting the King's consent, after which the comedy ran for three months.

TARUDANT, tā'rūdānt'. The capital of the Province of Sus, Morocco, situated between the base of the Atlas Mountains and the Sus River, 125 miles southwest of Morocco (Map: Africa, D 1). The surrounding country is highly cultivated and the city, walled and defended by a citadel, contains many fine mosques, groves, and gardens. The streets are narrow and crooked and most of the houses have but one story. Copper, gold, silver, and iron ores are mined in the vicinity and the chief industries are the manufacture of copper articles for Central Africa, tanning, leather dressing, and dyeing. Pop. (town), about 8500; (district) 30,000.

TARUMÁ, tā'rūd-mā'. A tribe of Arawakan stock (q.v.) on the headwaters of the Essequibo River, British Guiana. They came originally from the Rio Negro, Brazil. They are of medium stature, but well formed. Their language differs so much from the cognate dialects that it was formerly thought to constitute a distinct stock.

TARUMARI, tā'rūd-mā'rē, or **TARAHUMARI**. A numerous tribe of Piman stock (q.v.) occupying the Sierra Madre region of central and southern Chihuahua, and extending into the adjacent sections of Sonora and Sinaloa, Mexico. No reliable statement of their number can be given. On account of the broken character of their country there is no central organization, each valley settlement managing its own affairs under a local chief. The language is in several dialects and the people generally are classed by the Mexicans as Christians in the north and heathen in the south. Although peaceful in character, the Tarumari have several times revolted against the Spaniards and the Mexicans. In 1648 they rose, destroyed all the missions, drove out every Spaniard, and for four years maintained a successful resistance under their chief Teporaca. In 1690 they again rebelled, destroyed the missions, mines, and haciendas, and massacred all the Spaniards, but were finally subdued in 1692. A local insurrection in the neighborhood of Temosachic, northwest of Chihuahua City, in 1895, led by a native prophetess, was suppressed only after a massacre by Mexicans.

Physically, the Tarumari are dark and rather

undersized, but of remarkable strength. They resemble the Pueblo Indians. They make pottery and weave elaborate girdles of native cotton, though the men ordinarily wear only a loin cloth. They are sedentary and semiagricultural, but depend also upon hunting, fishing, and wild products. Much attention is given to the corn crop, nearly all their ceremonial dances being invocations or thanksgiving for rain. They have a feast of the dead a year after the funeral, and are devoted to the peyote rite, going hundreds of miles on foot to procure supplies of the cactus. Their houses are small thatched huts of logs or stones laid in clay mortar, and they frequently utilize the mountain caves for dwelling purposes. Consult K. S. Lummholtz, *Unknown Mexico* (New York, 1902).

TASCHEREAU, tash'rō', ELZÉAR ALEXANDRE (1820-98). A Canadian prelate and cardinal, born at Ste. Marie de la Beauce, Quebec. He was educated at the Quebec Seminary, with which, after his ordination to the priesthood in 1842, he remained connected for nearly thirty years, first as professor of moral philosophy and from 1860 as superior, the appointment including the rectorship of Laval University. In 1862 he was made vicar-general of the diocese, and Archbishop in 1871. In 1872 he founded the Hôtel Dieu du Sacré-Cœur at Quebec and restored the church at Ste. Anne de Beaupré. In 1886 he became Cardinal, the first Canadian member of the Sacred College. In 1894 he retired from the administration of his diocese. Consult J. C. Dent, *Canadian Portrait Gallery* (Toronto, 1880), and Henri Têtu, *Le Cardinal Taschereau* (Quebec, 1891).

TASCHEREAU, SIR HENRI ELZÉAR (1836-1909). A Canadian jurist. He was born at Ste. Marie de la Beauce, Province of Quebec, and was educated at Quebec Seminary. Called to the bar in 1857 he practiced his profession in Quebec City. He was a Conservative member of the Canada Legislative Assembly in 1861-67, and in 1871 was appointed a judge of the Superior Court of the province. He was a judge of the Supreme Court of Canada in 1878-1902, and Chief Justice thereof in 1902-06, retiring in the latter year. He was a member of the Judicial Committee of the Imperial Privy Council. In 1902 he was knighted. He published: *Notes and Commentaries on the Criminal Law of Canada* (1874); *The Code of Civil Procedure in Lower Canada* (1876); *The Criminal Code of the Dominion of Canada, as Amended in 1893* (1896).

TASCHEREAU, JULES ANTOINE (1801-74). A French author and statesman, born at Tours. He studied law at Orléans and then entered journalism in Paris. He was for a time the editor of the *National*; served in the magistracy; and in 1833 founded the *Revue Rétrospective*, devoted to the collection of documents upon history and literature (20 vols., 1833-37). In 1837 he was elected to the Chamber of Deputies. He sat in the Constituent Assembly, and then in the Legislative Assembly; supported the Empire, and was rewarded with a place in the National Library, of which he in time became director. Among his published works are *Histoire de la vie et des ouvrages de Molière* (1825) and *Histoire de la vie et des ouvrages de P. Corneille* (1829).

TASHKENT, tash-kānt', or **TASHKEND**. The capital of the Governor-Generalship of Russian Turkestan and of the Territory of Syr-Darya, as well as one of the most important

cities of Central Asia, situated near the Tchirchik, a feeder of the Syr-Darya, about 150 miles northeast of Samarkand (Map: Asia, H 4). It consists of the new Russian city, built up since the Russian occupation, and the old native city. The former is well laid out, abounds in private gardens, and compares favorably in regard to public buildings and educational institutions with most cities of European Russia. It has a library rich in works on Central Asia. The native city is still partly surrounded by walls and is Oriental in appearance, with its narrow crooked streets and low houses turning towards the street their blind walls. Tashkent manufactures leather goods, textiles, metal articles, and footwear. Agriculture and gardening are carried on. Commercial relations are also maintained with China by way of very ancient caravan roads. The trade has greatly increased in importance since the connection of the city with the Caspian Sea by rail. A large portion of the trade of the upper valleys of the Syr and Amon is centralized at Tashkent. Pop., 1904, 164,749, consisting chiefly of Sarts, Tatars, Kirghizes. The Russians number about 25,000. The first trustworthy mention of Tashkent dates from the seventh century, although local traditions attribute to the city very great antiquity. The town has been in possession of Russia since 1865.

TASIKO. See NEW HEBRIDES.

TASK, THE. A descriptive and didactic poem in blank verse by William Cowper, written in the summer of 1783 at the suggestion of Lady Austin, who had jestingly proposed a sofa as a possible subject for the poet.

TASK AND BONUS. A policy and system of management developed and introduced into a number of large manufacturing establishments by H. L. Gantt and usually associated with his name. Its principal elements are: (1) Determining the task which a workman suited to the job can be taught to perform readily. Task in this sense means a determined volume of output of standard quality, produced in the way determined to be the best. (2) Providing means of teaching or training the workman to perform this task regularly by the standard movements prescribed. (3) Fixing such payment for the accomplishment of the task as will secure the workman's cooperation and make him satisfied that he is being fairly treated. (4) Maintaining the usual day rate of payment to the workman during the process of training, or during any time when he fails to reach the determined rate of output—or, in other words, to perform the task set for him.

In substance, then, this method maintains the ruling rate of day wages for all employees, but awards in addition a bonus to those who achieve the task. In practice it is found most satisfactory to express this bonus in terms of time to be paid for, rather than directly as wages. Putting it in the form of a percentage of time allowed eliminates from consideration any question of the actual rate per day, which may be fixed by collective bargaining or by any method prevalent in the community. The rate of bonus, or the additional percentage of time allowed for achieving the task, varies with the conditions, but is generally between 25 and 40 per cent. For example, if the time allowed for completing a certain piece or certain volume of work under the task and bonus system is 10 hours, the wage rate is 20 cents an hour and the bonus offered is 25 per cent, the workman completing that

piece or turning out that volume of work in 10 hours or less is paid for 12½ hours. He receives \$2.50 for the job, regardless of time, if the time taken is within the task limit of 10 hours. The workman attempting the "task," but failing by taking more than 10 hours, is paid only the regular day rate for the actual time he has worked. If this is 11 hours, e.g., he would receive but \$2.20.

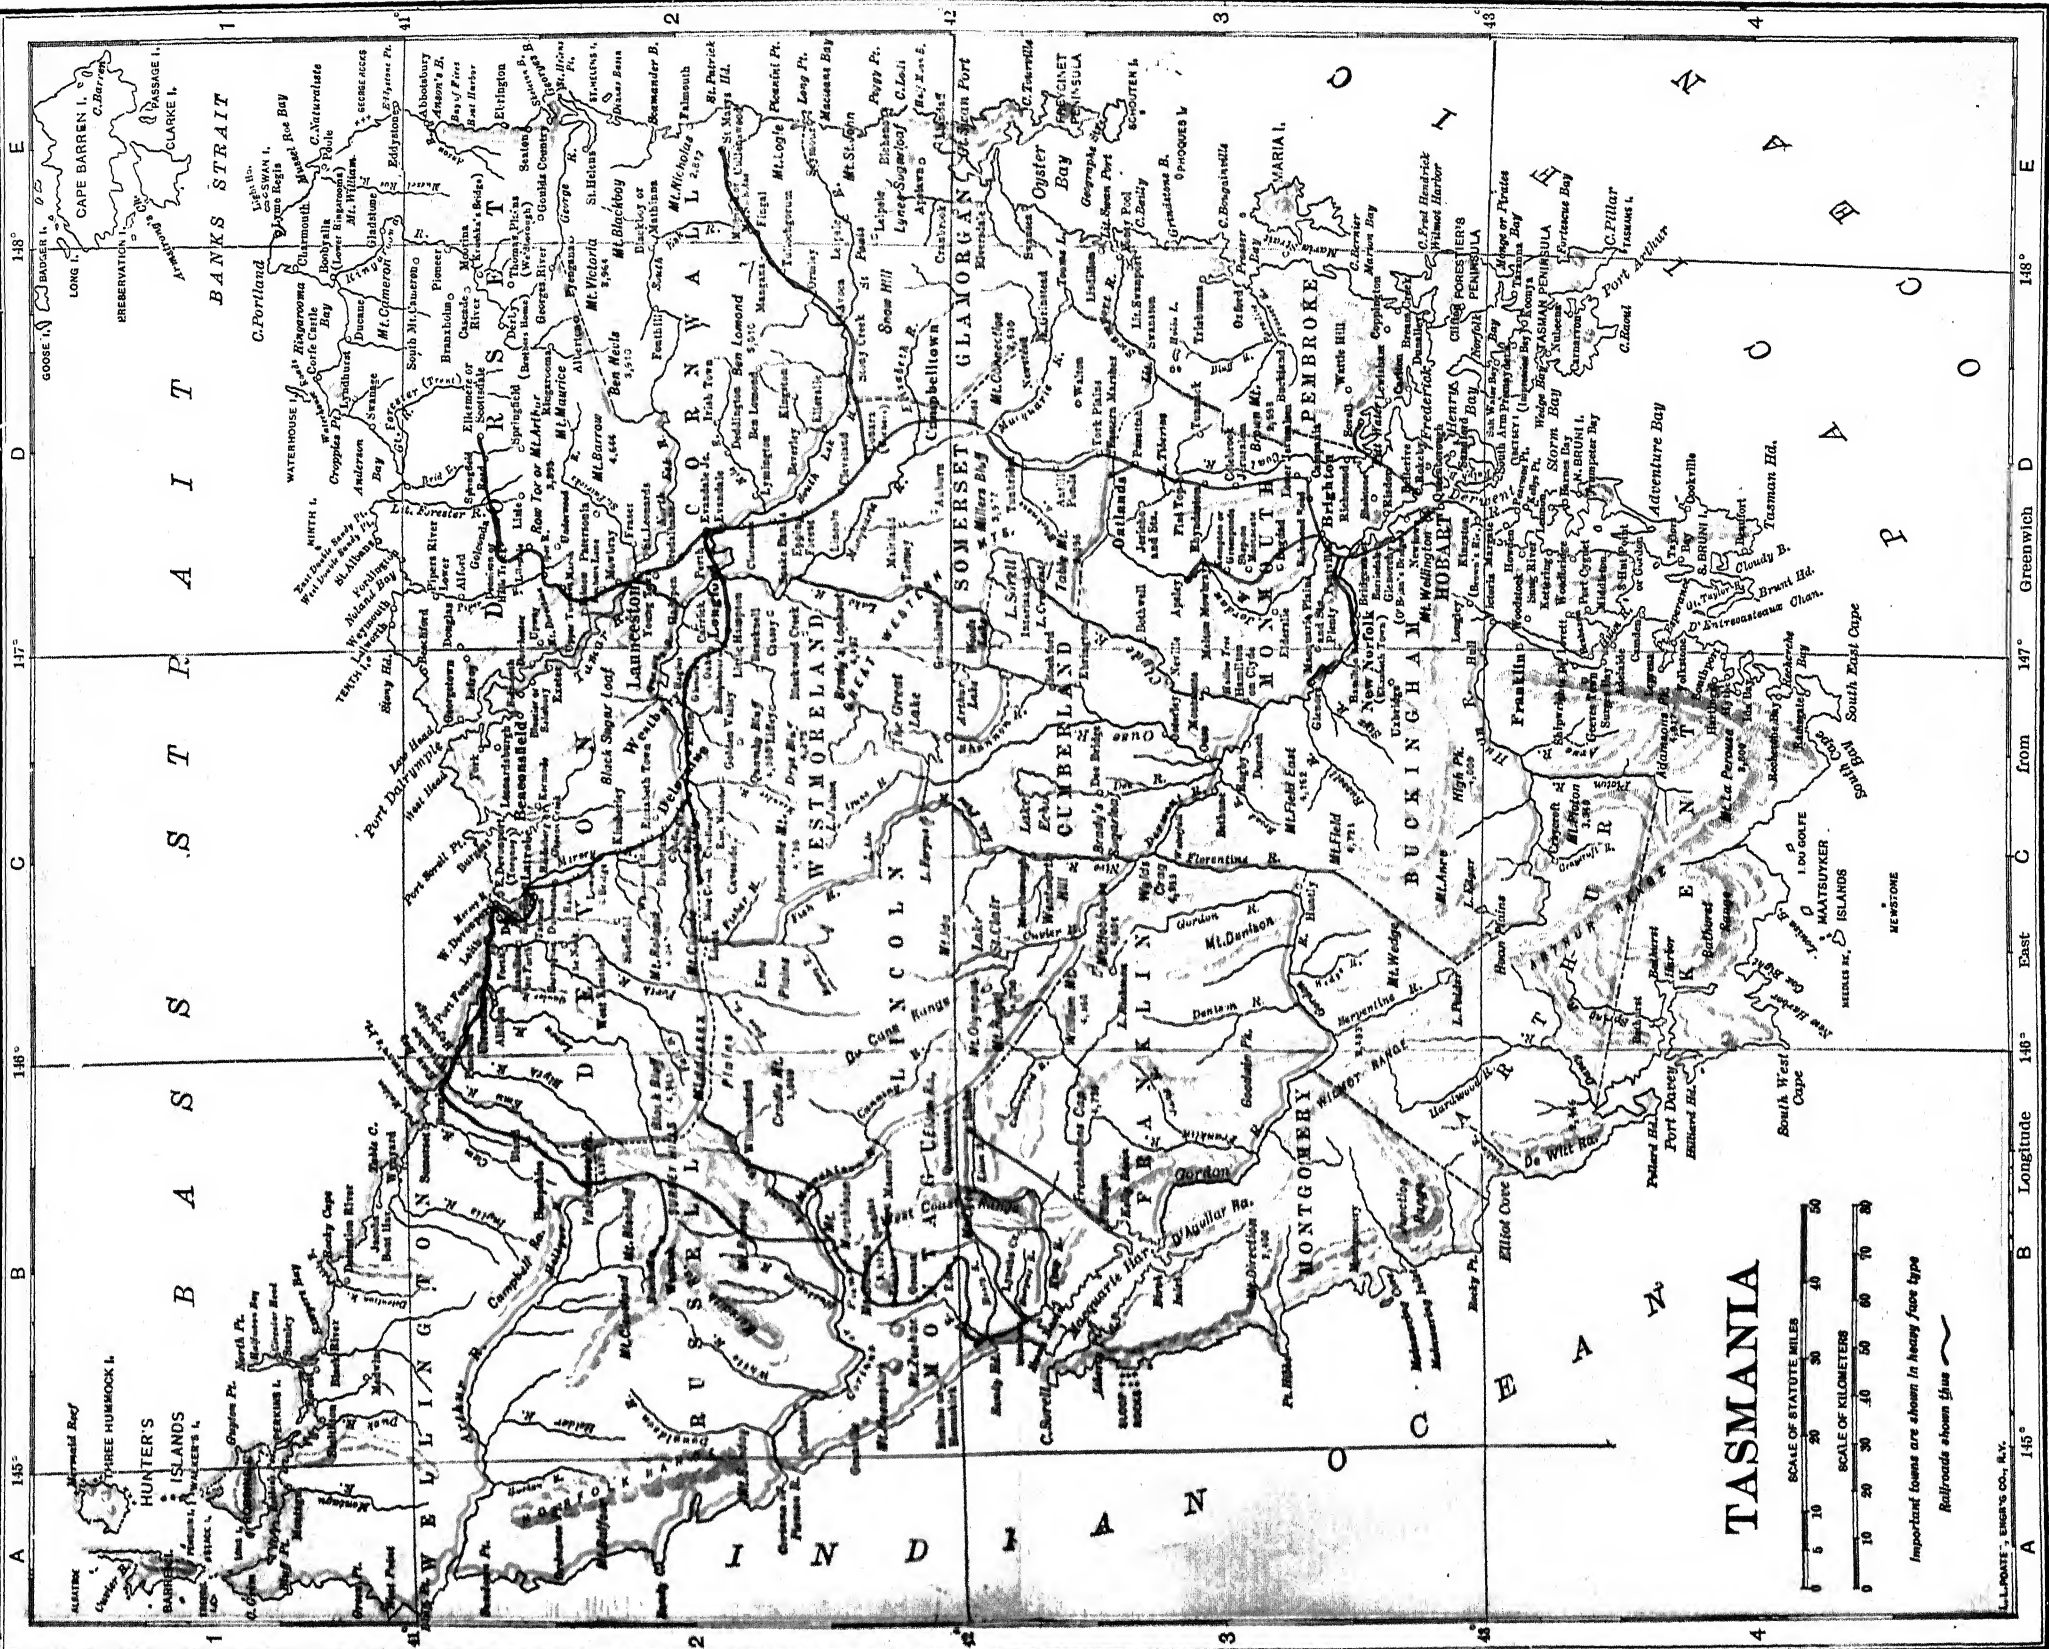

The objects sought are to secure the maximum output consistent with continued health and well-being of the operative, and at the same time to forestall or overcome the objections generally raised by workmen to new methods or new machinery. These spring usually from the fear (too often realized) that hardships will be imposed upon them by the change. The attractiveness of a new job or a new method is offset by the risk that the worker and his family may lose the means of support in the attempt to make the change or to gain higher efficiency. This is true even of the acceptance of piece rates; for with the possibility of larger gain there is also the chance of being able to turn out only a small output and consequently receive only small pay.

As the task and bonus system does not disturb the day rate as a primary basis of payment, the workman runs no risk in attempting to accomplish the task. Therefore if the work has been properly studied, and a properly attainable task has been set, and a proper rate of bonus is offered, the task and bonus method may afford a satisfactory solution for many labor problems. Consult H. L. Gantt, "Task and Bonus," in *American Society of Mechanical Engineers, Transactions* (New York, 1901), and *ib.*, *Work, Wages, and Profits* (2d ed., *ib.*, 1913).

TASKER, JOHN GREENWOOD (1853–). An English Wesleyan Methodist clergyman, born at Skipton and educated at Richmond College. He entered the ministry in 1875, and was elected to the Legal Hundred in 1902. From 1880 to 1884 he spent his time at Stuttgart, Germany. For many years he served as theological tutor in Richmond College and in Handsworth College, Birmingham, and of the latter became principal. Tasker published *Spiritual Religion*, the Fernley Lecture of 1901, and contributed to several important works.

TASMAN, tās'mān, ABEL JANSZON (c.1602–59). A Dutch explorer. He was born at Lutjegast, near Groningen, and early went to sea. He made two important voyages of discovery in the Pacific. In 1642 he left Batavia in command of an expedition sent out by Van Diemen, Governor-General of the Dutch East India Company, to circumnavigate the Australian continent. During his voyage of ten months he discovered (Nov. 24, 1642) Tasmania—which he called Van Diemen's Land—New Zealand, and the Friendly and Fiji Islands. After publishing an account of his voyage, which was reprinted in 1722 (2d ed. by Jacob Swart, 1860), he made a second voyage in 1644 to New Guinea and New Holland and discovered the Gulf of Carpentaria. His life has been written by Dozy, in his *Bijdragen tot de taal-, land-, en volkenkunde van Nederlandsch Indië* (1887), and by Walker (Hobart, 1896).

TASMANIA. A state of Australia occupying the island of Tasmania with its neighboring islands. The island of Tasmania, formerly called Van Diemen's Land, lies between lat. 40° 33' and 43° 39' S. and long. 144° 39' and 148° 23' E. (Map: Australasia, G 7). It is separated from

TASMANIA

Important towns are shown in heavy face type
Railroads shown thus ~

the southeastern portion of the Australian continent, the coast of Victoria, by Bass Strait, 140 miles wide; the Indian Ocean bounds the island on the west and the Pacific on the east, the two meeting at its southern extremity. Tasmania is irregularly heart-shaped, measuring 200 miles from north to south and 245 miles from east to west. The area of the main island is 24,331 square miles, and of the state, including the smaller islands, 26,215 square miles.

Tasmania is an ancient plateau, which has been extensively and irregularly dissected by the action of running water. A bleak table-land, 2000 to 3000 feet high, occupies the middle and a large part of the western half of the island and is crowned by mountains and cleft by chasms through which issue the torrential streams of the west coast. In the northwest this plateau reaches an altitude of 5069 feet in Cradle Mountain, the highest point of the island. In the northeastern corner of the island there is a similar plateau remnant, but between the two there is a series of great valleys extending from the mouth of the Tamar in the north to that of the Derwent in the south and affording the route for the main railroad line. The remaining parts of the island are cut up into a maze of deep valleys and high ridges and peaks, often of a precipitous character. There are about 20 peaks over 4000 feet high scattered through nearly every part of the island. The coasts are generally bold, and in the southeast are irregularly indented with fiords and harbors suggesting, together with the generally lower level of the surrounding mountains and the outlying islets, a subsidence of the land in this direction.

The central area is studded with a number of mountain lakes of considerable size, most of which feed the Derwent River. The rivers of Tasmania are large and numerous considering the size of the island. The most important are the Derwent and Huon in the south, the Gordon in the west, and the Tamar in the north, all of which enter the sea through large, navigable estuaries.

The climate, on account of the westerly winds, is more temperate and equable than that of the continent. At Hobart the mean temperature in summer is 62° F., and in winter 47° F., the extremes ranging to 100° F. and 29° F. The rainfall varies greatly in the different localities, and depends largely on the degree of exposure to the west winds, which bring most of the moisture. In the east the general average is 22 inches, in the north 30 inches, and in the west 40 inches, though some western localities have had 100 inches of rain in a year. In the west and southwest, where the rocks are granitic and schistose, the soil is rather poor. In the central valley and in the northern and southeastern districts the Tertiary deposits have combined with volcanic detritus to form a very rich soil of a chocolate color.

The flora is essentially Australian, and closely related to that of Victoria. The gigantic eucalyptus is widely distributed, and the Huon pine (*Dacrydium franklini*) is common in the south. The Tolasa Blue Gum attains a height of 350 feet. The conifers are well represented, there being 9 species peculiar to the island, and of the 1100 species of angiosperms, or higher plants, over 250 are restricted to Tasmania. The fauna, though also distinctively Australian, includes several mammals unknown on the mainland. The most remarkable of these are two

carnivorous marsupials, the Tasmanian wolf and the Tasmanian devil. See *DASYURE*.

The central table-land and the western and southern portions are built up mainly of Paleozoic strata through which harder igneous rocks have been intruded. Towards the coast Mesozoic and Tertiary formations appear, chiefly as sandstones, while throughout, but especially in the east, there are extensive volcanic outpourings, dikes of porphyry and greenstone, and large fields of basalt of Tertiary age. The latter, capping and protecting the softer sandstones, are largely responsible for the rugged and irregular nature of the surface. Considerable beds of coal and lignite appear in the Paleozoic and Mesozoic formations. Copper near Macquarie Harbor, tin in the northwest, and gold are important minerals, and coal mines and oil shale are worked.

The principal minerals produced are tin, copper, silver, and gold. Formerly copper led in the value of annual output, but it has been surpassed by tin, in the production of which Tasmania exceeds any other Australian state. Both lode and stream tin are worked. The principal tin workings are at Mount Bischoff, in the northwest; the workings at Brauxholm and Mount Cameron, in the northeast, should be mentioned. Copper is found chiefly on the west coast, particularly at Mount Lyell. Silver occurs on both east and west coasts. The principal gold fields are at Beaconsfield, Lefroy, and Mathinna. Up to the end of 1912 the recorded value of Tasmania's mineral output was £30,669,779, of which tin £11,972,602, copper £10,256,981, gold £7,407,282, and silver and lead £6,258,748. In 1912 the output of tin ore amounted to 3713 tons, valued at £543,103; in 1913, 4010 tons, £531,983. The value of the copper output in 1901 was £1,026,748, in 1912, £440,444, and in 1913, £375,664; the output amounted to 9730 tons in 1901 (besides 10,029 tons of ore), 6528 tons in 1912, and 6536 in 1913. The output of silver and lead in 1912 was valued at £309,098 and in 1913 at £319,997. The maximum gold output, £327,545, was reached in 1899; the output in 1912 was valued at £161,300, and in 1913 at £141,876. Other minerals, especially coal, are worked to some extent.

The agricultural development has been less noteworthy than that of the other Australian states. The area under crop in 1880-81 (140,788 acres) was smaller than in 1860-61; in 1912-13 it was 286,065 acres, and, in 1913-14, 264,140 acres. In addition, there were in the latter year 605,559 acres under permanent artificially sown grasses, as compared with 314,422 acres in 1901-02. Wheat cultivation has declined; in 1860-61 the acreage was 66,450; in 1865-66, 73,270; in 1912-13, 25,226. In 1913-14 there were under wheat 18,432 acres, yielding 349,736 bushels; oats, 58,886 acres, 1,598,664 bushels; potatoes, 30,811 acres, 80,389 tons; hay, 84,138 acres, 112,958 tons. Of great importance is the cultivation of fruit, especially apples; to apples 24,370 acres were devoted in 1912-13. Tasmania is well adapted to stock raising, but the industry has not shown much progress in recent years. On March 1, 1914, there were 43,941 horses, 205,743 cattle, 1,745,356 sheep, and 37,990 swine. The estimated wool clip for 1913 was about 8,872,000 pounds.

In the direct oversea trade (exclusive of the trade with other Australian states), imports and exports were valued at £816,886 and £625,031 re-

spectively in 1911, and £1,025,081 and £522,865 in 1913. The exports include tin, wool, silver, gold, timber, fruit, and jam. The principal ports are Hobart and Launceston. In 1914 there were 684 miles of railway, of which 519 miles belonged to the government. The gauge is mainly 3 feet, 6 inches.

The executive authority is vested in a Governor, who is appointed by the British crown and is assisted by a cabinet of five ministers responsible to the legislative body. This body is the Parliament, consisting of the Legislative Council (18 members, elected for six years) and the House of Assembly (30 members, elected for three years). Tasmania is represented by six Senators and five Representatives in the Australian Parliament. There is universal adult suffrage.

The revenue and expenditure in 1912 amounted to £1,111,292 and £1,077,857 respectively; in 1913, £1,238,085 and £1,235,014. Public debt June 30, 1914, £12,265,012; the debt was incurred for the construction of public works.

The estimated population of Tasmania in 1825 was 14,192; in 1850, 68,870; in 1875, 103,739; in 1900, 172,900. The census of March 31, 1901, returned a population of 172,475 (89,624 males, 82,851 females); that of April 3, 1911, 191,211 (97,591 males, 93,620 females). The people are almost wholly of British race; of the total in 1911, 172,497 were born in the Commonwealth of Australia. In 1911 there were 183,840 persons returned as Christian. Members of the Church of England numbered 88,158; Roman Catholics, 28,581; Methodists, 24,975; Presbyterians, 15,735. The population of the local government area of Hobart, the capital, was 27,526 in 1911 (with suburbs, 38,391); Launceston, 24,254. There are no other large towns. Marriages in 1913, 1620; births, 5886; deaths, 2131; arrivals, 45,893; departures, 45,168.

Elementary instruction is compulsory. In 1913 there were 431 public elementary schools, with 33,953 pupils enrolled; 16 superior schools, with an average attendance of about 1485; and 72 other schools (nongovernment), with 4450 pupils. There are two technical, besides three mining, schools. At Hobart is the University of Tasmania; the enrollment in 1913 was only 162.

Ethnology. The aboriginal inhabitants of Tasmania, who are now extinct, were of doubtful racial affinities, having been regarded by different authorities as being variously connected with the Papuan, Melanesian, and Australian races. They were of medium stature (1.66 m.), with broad, prognathous faces, subdolichocephalic skulls (index 76-77), very prominent brow ridges, very flat broad noses, dark skins, and frizzly hair, the last-named feature being the chief difference from the Australians. In culture the Tasmanians were probably even lower than the Australian aborigines. Their stone implements were of paleolithic type; they were as ignorant as the Australians of pottery and the bow and also lacked the Australian boomerang and spear thrower. Crude rafts of bark bound together with grass fibre formed their only means of navigation. The tale of the extermination of the Tasmanians, who never numbered more, perhaps, than five or six thousand, is one of the blackest pages in the history of European colonization. The European settlement began in 1804, and by 1824, when the first census was taken, there were only 340 natives

alive. These had dwindled down to four by 1865. The last Tasmanian, a woman named Tinganina, is said to have died in May, 1876.

History. In 1642 the Dutch navigator Abel Janszoon Tasman (q.v.) discovered the island now known by his name, supposing it to be the mainland of the southern continent, and called it Van Diemen's Land, in honor of his friend and patron, Anthony Van Diemen, Governor of the Dutch East Indies. It was visited by Captain Cook in 1777. The next recorded exploration is that of George Bass, a young English surgeon, who explored the strait which bears his name in 1798, and thus discovered that Tasmania was not a peninsula, but an island. Later in the year he returned and surveyed the entire coast. No colonizing was attempted until 1803. In that year Captain Collins brought out 400 convicts from England, and in 1804 laid out Hobart Town, the present capital of Tasmania. In the same year a settlement was founded in the northern part of the island by colonists from Sydney. In 1806 this colony was transferred to Launceston. From these two centres the colonization of the island proceeded steadily. Till 1823 the island was under the authority of the New South Wales government. In that year it received a separate Lieutenant Governor and in 1825 a separate Governor. The opposition to convict labor, always deep-seated, notwithstanding the scarcity of laborers, led, in 1835, to the first petition to the home government for its abolition. This, however, did not take place until 1853. In that year, too, the colony received its present name of Tasmania. In 1854 a constitution providing for responsible government by a Colonial Parliament was framed by the Legislative Council of the Colony, in accordance with the terms of the Australian Government Act of 1850, and this bill received the royal assent in 1855. On Jan. 1, 1901, Tasmania became a member of the Commonwealth of Australia. See AUSTRALIA.

TASMANIAN WOLF, TIGER WOLF, ZEBRA WOLF, or THYLACINE. A wolflike, carnivorous, and savage marsupial of Tasmania. See DASYURE; Colored Plate of MARSUPIALS; Plate of PHALANGERS.

TASMAN SEA. That portion of the South Pacific Ocean which is included between Australia and Tasmania on the west and New Zealand on the east (Map: Australasia, H, J 6). It is more than 15,000 feet deep and contains but few islands.

TASSAERT, tá'särt, ANTOINE (1729-88). A Flemish sculptor, born and trained in Antwerp. After working in London and Paris, where he studied under Slodtz, he was called to Berlin in 1775 by Frederick the Great, who made him court sculptor and rector of the Academy. He modeled many statues and groups in the academic French style; busts including that of Moses Mendelssohn (National Gallery, Berlin),

and the statues of generals Seydlitz and Keith, now in the Cadet School at Gross-Lichterfelde, where for the first time great generals are portrayed in their uniform instead of in Roman costume.

TASSAERT, NICOLAS FRANÇOIS OCTAVE (1800-74). A Flemish historical and genre painter. He was born in Paris, and studied at the Ecole des Beaux-Arts and under Girard and Guillon Lethière. He was one of the first realists and portrayed, with able technique, the sufferings of the poor and the unfortunate. His exaggerated pathos does not appeal to present taste, but he was highly regarded by Delacroix and the Barbizon masters. Among his most characteristic works are "The Suicide" and the "Unhappy Family." He also painted historical and religious compositions. Tassaert asphyxiated himself with the fumes of charcoal.

TASSIE, JAMES (1735-99). A Scottish modeler and gem engraver. He was born near Glasgow, and studied modeling at the Academy in Glasgow. In 1763 he went to Dublin, where he entered the laboratory of Henry Quin. Together they invented a kind of vitreous paste, or enamel of much hardness and beauty of texture, in which they reproduced gems and medallions. In 1766 Tassie settled in London, where he continued his work with gems and casts, and also made many large white enamel profile medallion portraits of notable contemporaries, among them Adam Smith, Sir Henry Raeburn, and Dr. James Beattie. He made reproductions of some of the most valuable collections of gems in Europe, and executed copies of about 15,000 examples for the Empress Catharine of Russia. He also furnished numerous casts for Wedgwood's (q.v.) work. From 1769 to 1791 he exhibited at the Royal Academy, and a large catalogue of his works, with descriptions by Rudolphe Eric Raspe, was published in the latter year. His nephew, **WILLIAM TASSIE** (1777-1860), also a gem modeler and caster, succeeded to his uncle's business and added greatly to the collection. A large part of it, bequeathed to the Board of Manufacturers, Edinburgh, is now in the Scottish National Portrait Gallery.

TASSO, TÄS'SÖ, BERNARDO (1493-1569). An Italian poet, born in Alenno (Bergamo) and educated at Padua. The early part of his life was spent in the service of the Sanseverino and Rangone families, for whom he visited Tunis, Spain, France, and Flanders. From 1563 he was engaged with Guglielmo Gonzaga, Duke of Mantua, who made him Governor of Ostiglia in 1567. His romanzesque epos *L'Amadigi di Gaula* (1542-60), based on the Spanish prose version of *Amadis of Gaul* by Ordóñez de Montalvo, attempts to reconcile the fantastic freedom of Ariosto with the theory of classic imitation. An episode of this poem he treated afterward separately in *Il Floridante*, completed by his son Torquato in 1587. The lyrics, *Amori* (1555) and *Rime, odi e salmi* (1560), as also his *selve* and *favole* have an historical interest as specimens of imitations (especially of Horace) and from their relations with the Petrarchistic movement. His *Lettere* (Padua, 1733-51) are a valuable contribution to the political and literary history of his time. Consult: Pasolini, *I genitori di T. Tasso* (Rome, 1895); Foffano, *L'Amadigi di B. T.* (Turin, 1896); F. Pintor, *Delle liriche di B. Tasso* (Pisa, 1899).

TASSO, TORQUATO (1544-95). The great Italian epic poet of the Catholic reaction, son of

the preceding, born at Sorrento, March 11, 1544. His earliest training was in the Jesuit schools of Naples. On his father's exile in 1552 Torquato went to live in Rome (1552-56), then to Bergamo (1556-57) and Urbino, where Bernardo had taken service (1557-58). In the spring of 1559 he settled in Venice, entering the law school at Padua the following year. From this time date his earliest sonnets and madrigals. Encouraged by their success and under his father's critical guidance he now also began his *Rinaldo*, a poem of Carolingian chivalric substance treated in the manner of Ariosto (a fabric of episodes), but with reference to Aristotelian principles of unity of action (all episodes involving Rinaldo). In 1561 Tasso changed his course at Padua to the school of philosophy and letters. The *Rinaldo* was published in 1562. During these years was being formed the European alliance against Turkey that was to lead to the battle of Lepanto. In the midst of this crusading propaganda (1561-62) Tasso wrote *Del Gerusalemme*, 116 octave stanzas, many of which were later transferred bodily to his immortal masterpiece. For his third semester in philosophy Tasso went to Bologna (1563). Accused of writing a libellous pasquinade against notables of the university, he was compelled (1564) to flee for his life. At his refuge in Modena he received a warm offer of hospitality from the future Cardinal and Patriarch of Jerusalem, Scipione Gonzaga, residing at Padua. Tasso there resumed his studies, composing meanwhile occasional and amorous lyrics for Gonzaga's Accademia degli Eritrei. He graduated in 1565, and received an appointment with Cardinal Luigi d'Este, assuming residence for his sinecure at Ferrara in October of that year. He was destined to remain there for a long period. He made occasional excursions to Mantua to visit his father and his sweetheart Laura Perperara; to Pesaro, Urbino, and Casteldurante as guest of his patroness Lucrezia Gonzaga della Rovere. In 1570 a journey to Paris with the Cardinal brought him in contact with the poets of the French Pleiade, notably Ronsard. Meanwhile Tasso had participated with growing prestige in the Academy life of Ferrara, writing verses and exercises of eloquence and erudition.

In 1572 he was transferred to the suite of Alfonso II Gonzaga, and the years 1572-74 mark the height of his social popularity. For a festival at Belvedere in 1573 he composed his elegant pastoral drama *Aminta*, a poem in free blank verse. This poem is suffused with a brilliant coloring of extraordinary mellowness. It has a sustained motivation of intense but languid sensuousness, through which runs a vein of the subtle humor inherent in sophisticated courtliness when applied to a pastoral subject. In 1574 Tasso became lecturer in astronomy and mathematics at the university of Ferrara and began a classic tragedy, *Galealto di Norvegia*. As early as 1570 he had resumed work on the subject treated in *Del Gerusalemme*; profoundly affected by current debates on aesthetics, he had been studying carefully the principles underlying epic compositions. His conclusions he embodied in three *Discorsi dell'arte poetica*, which remain the best comment on the structure and intent of the *Gerusalemme liberata*, and a typical expression of Aristotelian aesthetics of the Renaissance. The great poem was complete in 1575, a date which also marks the first signs of Tasso's loss of mental balance. He came to

betray a certain unexplainable terror for possible criticism of his work. These fears first concerned mere questions of form. He entrusted a private revision of the poem to his friend Scipione Gonzaga, who in turn consulted the celebrated critics Pier Angelio da Barga, Sperone Speroni, Flaminio dei Nobili, and Silvio Antoniano, and they set about the task with all the conscientiousness of pedants. Tasso's *Lettere* record the painful travails of his spirit during these discussions, which aroused in him also a fear lest his poem be in part heretical. The assurances of the Inquisition could not allay this dread. By 1576 he had decided completely to rewrite and allegorize his work, a revision prevented only by his complete nervous breakdown. He began to fancy the existence of plots against him at Ferrara and felt the ground at Florence and Rome as possible harbors of refuge. He quarreled with a certain Ercole Fucci, who finally assaulted him with a cane. In 1577, during an audience with his patroness Lucretia, he drew a knife on a servant who he feared was spying on him. This access led to careful surveillance and medical attention. From this time begin periods of mad flights and wanderings. In July of 1577 he tramped, begging his way as far as Sorrento, but returned apparently normal to Ferrara in April, 1578. In July again he went wandering to Mantua, thence to Padua and Venice, finally ending at Turin. Again in Ferrara, 1579, he became violent at the fancied coldness of his reception, and was confined in the insane asylum of Sant' Anna.

His confinement lasted till 1586, but in frequent lucid intervals he displayed a considerable literary activity. Then, at the instance of Angelo Grillo and Antonio Costantini, Tasso was permitted to accompany Vincenzo Gonzaga to Mantua. A renewed attack of melancholia was not relieved by a vacation in Bergamo (1587), and again Tasso fled, this time to Bologna, the Loreto shrine, whence finally to Rome. The persistent efforts of the Gonzaga to extradite Tasso have caused much discussion as to the presence of other motives than insanity in the poet's long imprisonment. At Rome Tasso was the guest of his old friend Scipione Gonzaga and later of the Aldobrandini. During the six following years he wrote or completed the tragedy *Il Torrismondo* (imitation of *Oedipus Rex*), the *Galeato*, the religious epic *Il mondo creato*, and the revised *Jerusalem Delivered* (which he now entitled *La Gerusalemme conquistata*).

In 1592 came a brief residence with Matteo di Capua and G. B. Manso in Naples. In 1594 Clement VIII assigned him a pension and looked favorably upon the idea of a poetic coronation. Before this scheme was carried out, however, the poet died, April 25, 1595.

The poem of Tasso deals with the taking of Jerusalem during the Third Crusade, largely as described by Guillaume de Tyre. This is the unifying theme, around which is an accretion of episode—the love stories of Rinaldo and Armida, of Tancred and Clorinda, of Erminia and Tancred, of Olindo and Sofronia. This romantic element comes to constitute the most important part of the poem; for while the treatment of the main theme falls cold in a matter-of-fact narrative adorned in vain by some extrinsic devices of style, Tasso gives in his episodes free play to his elegiac and idyllic sentiment. The best that can be said for the work as a whole is that the conception of God's

power sustaining the faithful man in his weakness to a great accomplishment, is objectified with a greater dignity and a greater freedom from banality than is apparent in any of the epic poems written on the theory that art is a branch of logical science. There is much that is dead in the *Jerusalem Delivered*. It is the episodic figures that live: Sofronia, wholly sane and conscious, but divinely possessed by the rapture of faith; Clorinda, her soul miraculously warmed with Christian charity, bidding an eternal farewell to her lover; the suffocating emotion of Erminia as she sees Tancred's distant camp in the moonlight; Armida's sensuous charm. The *Jerusalem Delivered* shows religious moods more deeply experienced than in any other religious poetry since the time of Dante; and it strikes here and there richer chords of melancholy and pathos than in any other Italian lyrics since Petrarch.

In the *Aminta* and *Jerusalem Delivered* we find nearly all the motives of the Italian verse of the next two centuries. Tasso may be considered thus, as also in matters of form, a great renovator of Petrarchism. His work gave great impetus to the development of *Seicentismo* (see ITALIAN LITERATURE), and he overshadowed both Petrarch and Dante in the minds of the baroque poets of the next five generations: this because, in theory and practice, he considered style as ornamentation, and ingenuity of metaphor the chief instrument of literary art.

Bibliography. Editions of *Gerusalemme liberata*: 1st ed., pirated (Venice, 1580), by Celio Malespini, entitled *Il Goffredo*; 2d and 3d ed. by Angelo Ingegneri (Parma and Casalmaggiore, 1581); 1st authorized ed. (Ferrara, 1581) by Febo Bonna. Modern critical ed. by A. Solerti (3 vols., Florence, 1895-96). Annotated ed. by S. Ferrari (Florence). Translations: Edward Fairfax (London, 1687, 1749, 1817, 1895); John Hoole (London, 1797, 1810, etc.). Others: P. Doyné (Dublin, 1761); Wifien (London, 1826, 1856); Carew (Manchester, 1881); James (London, 1884); *Aminta*: best ed. by Solerti (Turin, 1901); translations by Oldmixon (London, 1698); Dancer (ib., 1660); Whitmore (Springfield, Mass., 1900). Complete works: 33 vols., Pisa, 1821-32. Critical ed. minor works: *Lettere* and *Dialoghi* by Guasti (Florence, 1852-59) and *Prose diverse* (1875); A. Solerti, *Appendice alle opere in prosa* (Florence, 1892); *Opere minori in versi*; *Poemi minori*; *Teatro* (3 vols., Bologna, 1892-95); *Bibliografia*; *Rime d'amore*; *Rime d'occasione o d'encomio* (3 vols., Bologna, 1898-1902). Biography: in Italian, A. Serassi, *Vita di Torquato Tasso* (Bergamo, 1790); Angelo Solerti, *Vita di Torquato Tasso* (3 vols., Turin, 1895); A. Albertazzi, *Torquato Tasso* (Modena, 1911); in English: Robert Milman, *Life of Tasso* (2 vols., London, 1850); William Boultong, *Tasso and his Times* (New York, 1907), containing a bibliography. General criticism: Antonio Belloni, *Gli epigoni della Gerusalemme liberata* (Padua, 1893); Hedwig Wagner, *Tasso daheim und in Deutschland* (Berlin, 1905); Scopia, *Le fonti del mondo creato di Torquato Tasso* (Naples, 1907); G. E. Woodberry, in *Inspiration of Poetry* (New York, 1910); A. Sainati, *La lirica di Torquato Tasso* (Pisa, 1912); F. de Sanctis, *Storia della letteratura italiana* (2 vols., Bari, 1912).

TASSONI, tã-sŏ'nĕ, ALESSANDRO (1565-1635). An Italian diplomat, critic, and poet. He was born in Modena of an old patrician

family. About 1595 he published at Rome a dialogue in defense of Alessandro Magno and Obizzo d'Este, an effort which was dedicated to Cardinal Alessandro d'Este, and which attracted such favorable notice from that prelate that young Tassoni was taken into the service of Cardinal Ascanio Colonna (1597). His *Considerazioni sopra le rime del Petrarca* (1609) became the occasion of bitter controversy. In 1613 Tassoni entered the service of Charles Emmanuel of Savoy. But his *Filippiche contra gli Spagnuoli* (1615; reprinted 1855) incurred the displeasure of Cardinal Prince Filiberto of Savoy, and Tassoni withdrew into private life (1622). Afterward he became secretary to Cardinal Ludovisi, and then councillor and chamberlain at the court of Duke Francis I of Modena (1632). The *Pensieri diversi* of Tassoni form a curious monument of Seicento culture, but the poet achieved his greatest fame with *La scchia rapita* (The Rape of the Bucket, written 1614; published in Paris, 1622; ed. by Carducci, 1861, etc.). This is a mock heroic poem in 12 cantos, founded upon an incident of the Modenese wars. It is a precursor of Boileau's *Lutrin* (1673) and Pope's *Rape of the Lock* (1712). Its humor, the Tuscan purity of its language, and the perfection of its metrics have made it an Italian classic. Consult: Nunziante, *Alessandro Tassoni, e il Seicento* (Milan, 1885); Bacci, *Le considerazioni sul Petrarca di Alessandro Tassoni* (Florence, 1887); ed. of *Scchia, Oceano, and Rime* by Casini (ib., 1887); Ambrosi, *Sopra i Pensieri diversi di Alessandro Tassoni* (Rome, 1896); *Le lettere di Alessandro Tassoni*, ed. by G. Rossi (Bologna, 1901); the important *Miscellanea tassoniiana*, ed. by Casini-Santi (Modena, 1908); G. Rossi, *Saggio di una bibliografia delle opere di Alessandro Tassoni* (Bologna, 1908).

TASSY, JOSEPH HÉLIDORE SAGESSE VERTU GARCIN DE. See GARCIN DE TASSY, J. H. S. V.

TASTE (OF. *taster*, Fr. *tâter*, to taste, from Lat. **taxitare*, frequentative of *taxare*, to touch, intensive of *tangere*, to touch; connected with Goth. *tīkan*, Icel. *taka*, AS. *tacon*, Eng. *take*). The sensations of taste are four in number: salt, sweet, sour, and bitter. The varied experiences commonly regarded as tastes are, therefore, blends or fusions of one or more taste qualities with other sensations. Lemonade, e.g., is blended of sour and sweet, cold, pressure, and the odor of lemons. If the nostrils are plugged with cotton wool, claret cannot be distinguished from vinegar or a morsel of raw potato from apple.

Taste is a chemical sense, and like vision and smell, though in a less marked degree, shows the phenomena of mixture, adaptation, and contrast. In mixture, there is at least a partial compensation for all pairs except sweet-salt, if the components are mixed in the proper proportions and at low intensities. Sweet and salt themselves mix to a flat or vapid quality, somewhat as blue and yellow mix to give a gray. Complete adaptation can be attained only by stimulation for several hours with strong solutions; but experiment bears out the common experience that any one of the four qualities is weakened after a stimulation of a few moments. Contrast is both simultaneous and successive. The contrasting pairs are sweet-salt, sweet-sour, and salt-sour; bitter does not contrast with any other taste. The stimulation of the tongue by the one member of these pairs increases its sensitivity to the other member, or causes distilled water to give the contrasting taste.

The tongue, like the skin, is supplied with nerve endings which mediate sensations of pressure, temperature, and pain. The nerve endings concerned in gustatory sensation are the taste bulbs or beakers, many of which are clustered together in the sides of the circumvallate and fungiform papillæ. The central area of the tongue is insensitive to taste; the tip is most sensitive to sweet, the base to bitter, and the edges to sour. This does not mean, however, that all the papillæ in a given region will respond in the same way to gustatory stimuli. As a matter of fact, some respond to four solutions (usually sugar, quinine, tartaric or hydrochloric acid, and salt), others to but three, still others to two, and a few to one alone. We are led to suppose, therefore, that there are four kinds of taste cells, each one responsive to a single mode of stimulus, and that a given papilla may contain all four, or three, or two, or only one. Consult: W. Nagel, *Handbuch der Physiologie des Menschen*, vol. iii (Brunswick, 1905); Oswald Külpe, *Outlines of Psychology*; Eng. trans. by E. B. Titchener (new ed., London, 1909); E. B. Titchener, *Text-Book of Psychology* (New York, 1910); W. M. Wundt, *Physiologische Psychologie*, vol. ii (6th ed., Leipzig, 1910); Ladd and Woodworth, *Elements of Physiological Psychology* (New York, 1911). See PSYCHOLOGICAL APPARATUS. For taste in animals, see CHEMICAL SENSE IN ANIMALS.

TATAR BAZARJIK, tá-tár' bá'zár-jék', or PAZARJIK. A district town in east Rumelia, Bulgaria, situated on the Maritza, 74 miles southeast of Sofia (Map: Balkan Peninsula, E 3). It lies in a low region and suffers from inundations. Pop., 1905, 17,597, mainly Bulgarians. The place was founded by Tatars in the fifteenth century.

TATARS, tá'tarz (less correctly *Tartars*, Fr. *Tartare*, from ML. *Tartarus*, from Pers. *Tātor*, Chin. *Tahtar*, *Tah-dzū*, Tatar, possibly from a Tungusic or Manchu word meaning archer, nomad; probably confused by popular etymology with Lat. *Tartarus*, hell, on account of their atrocities). A term loosely applied to certain Tungusic tribes originally inhabiting Manchuria and Mongolia, and now represented by the Fishshin Tatars of northern Manchuria, the Solons and Daurians of northeastern Mongolia, and the Manchus of China. In the course of the westward movement of the Mongols the term Tatar obtained vogue among the civilized peoples of western Asia and eastern Europe, and came to be applied with little discrimination to the hordes of Mongols who descended from time to time upon the frontiers of Occidental civilization and to the kindred peoples subdued by them. Ultimately it came to be used almost, if not quite, as a synonym for Turkish (*Türki*), in which sense it is still employed by some modern ethnologists.

The "Tatars of Siberia" (Baraba, Irtysh, Tobol, etc.) are probably of very mixed origin. In western Siberia some fragments of the Ostiaks, etc., have been styled Tatars, probably from their adoption of Tatar customs, etc. The Tatars of European Russia are of diverse origins. The so-called Kazan and Astrakhan Tatars are fragments of the Golden Horde. The Tatars of the Crimea are probably composed of the Nogai-Tatars of the steppes and the Tatars of the mountains and coast regions. There are besides the Tatars of the Caucasus. It will easily be seen that most of these peoples styled

Tatars are, linguistically at least, of Turkic stock, but very mixed physically. Consult: Otto Wolff, *Geschichte der Mongolen oder Tartaren* (Breslau, 1872); H. H. Howorth, *History of the Mongols* (London, 1876-80); Hermann Vámbéry, *Etymologisches Wörterbuch der turko-tatarischen Sprachen* (Leipzig, 1878); id., *Die primitive Cultur des turko-tatarischen Volkes* (ib., 1879); Emile Chantre, *Recherches anthropologiques dans le Caucase* (5 vols., Paris, 1885-87); Charles de Harlez, *La religion nationale des Tartares orientaux* (Brussels, 1887).

TATE, SIR HENRY (1819-99). An English manufacturer and art patron. He was born at Chorley, Lancashire; entered early on a commercial career in Liverpool, and in 1874 went to London, where he acquired a large fortune in sugar refining. He was the principal founder of Liverpool University College. His chief claim to distinction, however, is as founder of the National Gallery of British Art, popularly known as the Tate Gallery, on the Thames Embankment, near Vauxhall Bridge. This originated in his private collection of modern British pictures. His desire to have this collection preserved prompted his offer of £84,000 for a building purely devoted to British art, if the government would provide the site. The building was completed and opened in 1897.

TATE, NAHUM (1652-1715). An English poetaster, born in Dublin. He graduated at Trinity College, Dublin, in 1672, and five years later he was settled in London. In 1692 he succeeded Shadwell as poet laureate. With the exception of *Pye* (q.v.), he was the tamest of the laureates. He passed his last days in the Mint in Southwark, then a privileged sanctuary for debtors. Tate composed several plays and much poor verse, including elegies and birthday odes. His best poem, composed independently, is *Panacea, a Poem on Tea* (1700). With some success he wrote a second part to Dryden's *Absalom and Achitophel* (1682). The best passages, however, were by Dryden. In literary history Tate has gained unenvied fame as an adapter of several plays by Shakespeare and other Elizabethans. Among them are *Richard II* (1681), *King Lear* (1681), and *Coriolanus* (1682). His version of *Lear*, in which Cordelia survives and marries Edgar, held the stage till 1840. Tate is also known as the joint author, with Nicholas Brady, of the *New Version of the Psalms* (1696; supplement 1698). To Tate is ascribed the beautiful Christmas hymn "While Shepherds Watched." Consult L. F. Benson, *The English Hymn: Its Development and Use in Worship* (New York, 1915).

TATE, RALPH (1840-92). An English geologist and paleontologist, born at Alnwick. He studied at the Royal School of Mines, and in 1861 entered the Philosophical Institution of Belfast as a teacher of natural sciences. In 1867 he joined an expedition for the exploration of Nicaragua and Venezuela; and upon his return to England published a series of papers on the geology and paleontology of those countries. Appointed professor of natural sciences in the University of Adelaide, South Australia, in 1875, he passed the remainder of his life in that country, where he was active in scientific research and helped to establish the Royal Society of South Australia. The list of his publications includes several hundred papers and monographs, among them *Flora Belfastensis* (1863); *New Yorkshire Lias* (1876); *Hand-*

book of the Flora of Extra-tropical South Australia (1890).

TATIAN, tā'shan. A Christian apologist of the second century. He was a native of Assyria, received a Greek education, and came to Rome in the time of Justin Martyr, with whom he was intimately associated, probably about the year 152. Under the instruction of this first Christian philosopher, Tatian early became a Christian, and wrote thereupon his first important work, *The Address to the Greeks*. After Justin's death he turned towards views which caused him to be identified with the Gnostics, although comparison of the different accounts leads to the suspicion that party spirit may have exaggerated his departure from the commonly received Christian doctrines and practices. Tatian returned to Mesopotamia, where he was welcomed heartily and performed valuable services for the Church. He prepared here a harmony of the Gospels in Syriac, under the name of *Diatessaron*, or *The Fourfold Gospel*, which early attained a wide circulation among the Syriac-speaking churches, and was made the subject of a commentary by Ephraem Syrus. The Syriac original cannot have been prepared long after Justin's death (about 166), and therefore gives important testimony to the general acceptance of the Fourth Gospel at that time, and hence to its considerably earlier origin. The *Diatessaron* has accordingly been an object of great interest, but the text has been until recently regarded as hopelessly lost. In 1883 a description of an Arabic translation of the *Diatessaron* existing in the Vatican Library, previously but imperfectly described by others, was put forth by Ciasca, a "scriptor" in that library, and in 1888 he published an edition of the text with a Latin translation. A second manuscript of the same translation had meantime been presented to the library (1886). This Latin version has been translated into English by Hill (Edinburgh, 1894; 2d ed., 1910), and an English translation from the Arabic has been made by Hogg in the *Ante-Nicene Fathers*, vol. ix (New York, 1896). Consult: Zahn, *Forschungen zur Geschichte des neutestamentlichen Kanons*, vol. iv (Erlangen, 1891); Harris, *The Diatessaron of Tatian* (London, 1890); id., *Fragments of the Commentary of Ephrem Syrus on the Diatessaron* (ib., 1895); A. Hobson, *The Diatessaron of Tatian and the Synoptic Problem* (Chicago, 1904). Both the extant works of Tatian may be found in translation in the *Ante-Nicene Fathers*, vols. ii and iv (New York, 1885 et seq.).

TATISHTCHEV, tā'tish-chëf, VASSILI NIKITICH (1686-1750). A Russian historian of the school of Peter the Great (q.v.). He studied at Moscow and in Germany. Tatishchev participated in the war with Sweden, after which he went on embassies to Poland, Holland, Germany, and Switzerland. Subsequently he was made Governor of Astrakhan and superintendent of mines in the Ural region. Tatishchev pleaded for the advancement of learning, especially in his *Dialogue on the Benefit of the Sciences*, written in 1733 and first published only in 1887, and wrote a good *History of Russia*, and a didactic treatise, *Testamentary Injunctions* (1773; new ed., 1885), addressed to his son.

TATIUS, tā'shi-us, ACHILLES. A Greek writer. See **ACHILLES TATIUS**.

TATLER, THE. A penny paper published in London by Sir Richard Steele, issued three times a week and running through 271 numbers, be-

tween April 12, 1709, and Jan. 2, 1711. Its original purpose was merely to describe events of the day; but with the contributions of Addison, which began in number 18, it gradually assumed a more didactic tone and eventually became a set of essays on various social and quasi-political topics. Its sudden withdrawal was probably occasioned by the exception taken by Steele's superiors in government offices to certain statements printed in it and the editor's consequent dismissal from the gazetteership. His pseudonym of Bickerstaff had also by this time been penetrated. Steele wrote 188 of the papers and Addison 41. The remainder were mostly written in collaboration. The successor of the *Tatler* was the *Spectator* (q.v.).

TATLOCK, JOHN STRONG PERRY (1876-). An American English scholar, born at Stamford, Conn., and educated at Harvard (A.B. 1896; Ph.D., 1903). He taught at the University of Michigan from 1897, becoming professor of English in 1913. He edited Shakespeare's *Troilus and Cressida* (1912), and with Percy MacKaye, made a version of Chaucer called *The Modern Reader's Chaucer* (1912); and published also *Development and Chronology of Chaucer's Works* (1907); *Harleian MS. 7334, and Revision of Canterbury Tales* (1909); *The Scene of the Franklin's Tale Visited* (1914).

TÁTRAFÜRED, tä'trá-fü'réd (Ger. *Schmeks*). A noted Hungarian watering place and health resort in the county of Zips, situated in the midst of pine forests on the south slope of the Hobe Tátra, at the foot of the Schlagen-dorf peak at an elevation of 3340 feet above the sea. It has mineral springs, pine-cone baths, and a cold-water cure. Near by are the health resorts of Uj Tátrafüred (Neuschmeks) and Alsó Tátrafüred (Lower Schmeks).

TÁTRA (tä'tró) **MOUNTAINS**. See CARPATHIAN MOUNTAINS.

TATS, táts, or TATES. An agricultural people of extreme western Persia and the Caspian region of the Caucasus. Although they may possess some Mongolian blood, they are not Tatars either somatically or linguistically. Some authorities class them with the Persian Tajiks (q.v.). Their number approximates 100,000. Their language is a dialect of Persian.

TA TS'ING, tä'tsing' (or CH'ING). The dynasty on the throne of China at the opening of the twentieth century. It was of Manchu origin and began with the year 1644. The name—*Ts'ing*—means "pure" or "purity," and is said to be synonymous with the word *Manchu*. *Ta*

THE REIGN PERIODS OF THE TA TS'ING CH'AO OR "GREAT PURE" DYNASTY OF CHINA

NAME OF REIGN	Began	Ended
1. Shun-chih.	1644	1661
2. K'ang-hi or K'ang-hsi.	1662	1722
3. Yung-ching or Yung-chêng.	1723	1735
4. K'ien-lung or Ch'ien-lung.	1736	1795
5. K'ia-k'ing or Chia-ch'ing.	1796	1820
6. Tao-kuang.	1821	1850
7. Hien-fung or Hsien-fêng.	1851	1861
8. T'ung-chih.	1862	1874
9. Kwang-sü or Kwang-hsi.	1875	1908
10. Hsüan-tung.	1909	1912

means "great" and was prefixed to almost all dynastic names. It is to be remembered that the personal name of a Chinese emperor was

never used during his lifetime. When he came to the throne a name for the period of years during which he reigned was chosen; but it is convenient at times to transfer this name to the man himself; hence we sometimes speak of the Emperor K'ang-hi, or the Emperor K'ien-lung, though strictly speaking these names denote only certain periods of years. The dynasty came to an end Feb. 12, 1912, when the child Hsüan-tung abdicated in favor of the Republic.

TAT'TAM, HENRY (1789-1868). A distinguished Coptic scholar. He was born in Ireland and was educated at Trinity College, Dublin, and at Göttingen and Leyden; he was ordained in the Church of England; and was rector of St. Cuthbert's, Bedford, 1818-45; archdeacon of Bedford, 1844-66; and rector of Stamford Rivers, Essex, 1849 till his death. He traveled in the East and became distinguished as an Orientalist, in which department he published various works. Among the ancient Syriac manuscripts which he found at a convent in Egypt were the *Ecclesiastical History* of John, Bishop of Ephesus, and the *Epistles of Ignatius*. He published a Coptic grammar (1830; 2d ed., 1863), and a dictionary (1835), besides versions of the prophets (1836-52) and of the *Apostolical Constitutions* (1849) in that language.

TATT'ERSALL'S. A famous English market for riding and carriage horses, at Knightsbridge, London; established in 1766 at Hyde Park Corner by Richard Tattersall, a groom to the Duke of Kingston. It consists of a large and handsome building in the centre of which is a large court under a glass roof. At one time it was the centre of all business relating to horse-racing and betting throughout the country.

TATTI, GIACOPO. See SANSOVINO, JACOPO.

TATT'NALL, JOSIAH (1795-1871). An American naval officer, born at Bonaventure, near Savannah, Ga. He was educated in England, and entered the United States navy in 1812. He served with Decatur in the Algerine War and became a lieutenant in 1818. In the Mexican War, he fought at the capture of Vera Cruz, and led the attack upon the forts at Tuxpan, where he was wounded. In 1850 he became a captain, and in 1857 flag officer on the Asiatic station. In 1859, while on this station, he chartered the small river steamer *Toeywan* to take the American Minister to Peking in order to ratify a treaty negotiated in the preceding year. When the American squadron arrived off the Peiho, Tatt'nall found there the French and British naval forces with their diplomatic representatives on board. The Chinese having refused permission for any foreign vessels to proceed, the British and French forces attacked the forts. Seeing that they were being worsted, and that the boats containing reinforcements could not stem the strong current of the stream, Tatt'nall, in the *Toeywan*, declaring that "blood is thicker than water," towed the flotilla up to the support of the badly pressed vessels. The phrase has become historic.

On the outbreak of the Civil War in 1861, Tatt'nall resigned and became captain in the Confederate navy, charged with the defense of Georgia and South Carolina. In March, 1862, he was given command of the *Merrimac* (*Virginia*) and the defenses of Virginia; destroyed this vessel in order to escape capture; was later court-martialed, but acquitted; was unsuccessful in his defense of Savannah, and in January, 1865, was obliged to destroy his fleet. He was

included in Johnston's surrender to Sherman, was paroled, and in 1866 removed with his family to Halifax, but returned in 1870 and was inspector of the port of Savannah until his death. Consult C. C. Jones, *Life and Services of Commodore Josiah Tattnall* (Savannah, 1878).

TATTOO'ING (from *tattoo*, Tahitian *tatu*, tattooing, tattooed). The practice of decorating the surface of the body by introducing pigments under the skin. The process consists in pricking the skin with a sharp instrument and inserting the pigments, usually powdered charcoal, in the punctures. The design appears in a deep blue color and is indelible. Other pigments have come into use in recent times. As a primitive mode of ornamentation, tattooing is widespread, its distribution as compared with the related custom of scarification being determined by the color of the skin. In general, light-skinned races tattoo, while dark-skinned peoples practice scarring. In Oceania the practice is especially developed among the Polynesians.

The original significance of tattooing is disputed. It has been held by some that it had a religious or social meaning, but the best evidence goes to show that it was at first purely ornamental in character. It must indeed be admitted that in many instances the tattooed designs have a tribal or clan or even a religious meaning, but this usage is probably derived from the decorative. The patterns range from simple lines and dots to complex designs. Probably the fullest development of the custom among primitive peoples is in New Zealand, and the Marquesas Islands, though it is also much practiced in various parts of the East Indian archipelago. The tattooing of the natives in North and South America and in parts of the world other than those mentioned above is, as a rule, simple. In modern times and among higher races the Japanese have brought the art to its highest state of perfection. The prevalence of the practice among sailors of all nationalities is well known, but in both these cases the patterns in use have entirely lost their primitive characteristics and are of civilized origin. Consult: J. A. E. Lacassagne, *Les tatouages* (Paris, 1881); Wilhelm Joest, *Tätowieren, Narbenzeichnen und Körperbemalen* (Berlin, 1887); H. G. Robley, *Moko; or Maori Tattooing* (London, 1896); Augustin Kraemer, *Die Samoainseln* (Stuttgart, 1902).

TAU, tou. See CHINESE LANGUAGE; TAOISM.

TAUBERT, tou'bért, WILHELM (1811-91).

A German pianist and composer, born in Berlin. He studied philosophy at the university there, at the same time studying composition under Berger and Klein, and afterward taught music until 1831, when he became conductor of the court concerts. In 1842 he was appointed conductor of the royal opera. He was a member of the Academy of Arts from 1834 and president of the musical section of the same from 1875. His works include the operas *Die Kirmes* (1832), *Macbeth* (1857), *Oesario* (1874), music for the *Medea* of Euripides, and Shakespeare's *Tempest*. His songs were popularized by Jenny Lind and other noted singers.

TAU BÉ'TA PI ASSOCIATION. A college honorary technical fraternity that was organized in Lehigh University, South Bethlehem, Pa., in 1855. It derives its name from the initials of three Greek words that form the secret motto of

the association. The Tau Beta Pi bears the same relation to engineering and similar studies as the Phi Beta Kappa (q.v.) does to literary scholarship, and the Sigma Xi (q.v.) does to original research in science.

The object of the fraternity is to mark in a fitting manner those who have conferred honor upon their Alma Mater by a high grade of scholarship as undergraduates, or by their attainments as alumni, and to foster a spirit of liberal culture in the technical and scientific schools of America.

There were in 1914, 27 chapters in as many different colleges and technical schools and 5699 members, of whom 5029 were active, 412 graduate, and 258 honorary members.

The badge is a watch charm or scarf pin of gold, shaped like the bent of a trestle. On its obverse there are engraved the secret name and symbols of the association, while on the reverse the name of the chapter appears on the cap of the bent, and on the sill are the name and class of the owner. The colors of Tau Beta Pi are seal brown and white.

Tau Beta Pi has published since March, 1906, an octavo quarterly magazine called *The Bent of Tau Beta Pi*, and also in 1911 issued a *Catalogue of the Tau Beta Pi Association* to which have since been added periodic supplements.

TAUBMANN, toup'mán, OTTO (1859-). A German composer, born at Hamburg. At first he followed a commercial career, but later entered the Dresden Conservatory, where his teachers were Willner and Nodde. In 1886-89 he was director of the Conservatory at Wiesbaden, in 1891-92 theatre conductor at St. Petersburg. In 1895 he settled in Berlin as critic of the *Berliner Börsen Courier*. At one bound he attained fame when his great choral work, *Eine Deutsche Messe* (for soli, chorus, orchestra, and organ), was produced at Dortmund in 1898. His other works, all cast in large form, are: *Psalm XIII* (for soli, chorus, and orchestra); *Tauwetter* (for male chorus and orchestra); *Krieg und Frieden* (chorus and orchestra); the choral drama *Sängerweihe* (1904).

TAUCHNITZ, touk'níts, CHRISTIAN BERNHARD, BARON (1816-95). A German publisher, born near Naumburg, a nephew of the following. His firm, founded in Leipzig (1837), was noted for its accurate classical and biblical texts, its dictionaries and other works of reference. In 1841 Tauchnitz began a *Collection of British (and American) Authors*, now extending to over 4000 volumes and widely read on the Continent. English authors were paid a royalty by Tauchnitz, who thus helped to establish the present international copyright law. A similar collection of translated *German Authors* was begun in 1866 and *Students' Tauchnitz Editions* of English and American works began to appear in 1886 with German notes and introductions. Tauchnitz was made Baron in 1860, British Consul General for Saxony in 1872, and member of the Saxon House of Peers in 1877.

TAUCHNITZ, KARL CHRISTOPH TRAUGOTT (1761-1836). A German publisher, born in Grossbardau. He began to print books in 1797 at Leipzig. He was the first to use stereotype plates (1816) in Germany. His stereotyped editions of the classics were once widely famed alike for their cheapness, their convenience, and their accuracy. He thus printed a Bible in Hebrew and the Koran in Arabic. By his will Leipzig received 4,500,000 marks for charitable

ends. The business was continued by his son Karl Christian (1798-1884).

TAU (tou) **CROSS**. See **ANTHONY, SAINT, CROSS OF**.

TAUERN, tou'ern. A division of the eastern Alps, including the principal section of what was known to the ancients as the Noric Alps (Map: Austria, C 3). It lies between the rivers Drave and Mur on the south and the Enns on the north, and extends from Brenner Pass in eastern Tirol through the Austrian crownlands of Salzburg and Carinthia into north Styria. The system consists of two main divisions, the Hohe (high) Tauern in the west, and the Niedere (low) Tauern in the east. The whole system has a length of about 150 miles and a width of 28 miles. It is wholly of Archean formation, consisting chiefly of gneiss in the west and mica-slate in the east, with some granite. The western or Hohe Tauern, as their name implies, are considerably higher and more rugged than the eastern. Their main range forms a sharp ridge with steep sides rising above the snow line and carrying over 250 glaciers, from which numerous mountain torrents fall in cataracts down the steep valleys. The highest peak in the system is the Grossglockner, with an altitude of 12,461 feet.

TAULER, tou'lër, **JOHANN** (1300-61). A German mystic. He was born at Strassburg and when 15 years old entered the Order of the Dominicans. When the "black death" visited Strassburg in 1346, he stuck to his post and comforted the people. Excepting for preaching tours into the Rhineland, where he came into contact with the Friends of God (q.v.), he remained in Strassburg until his death. Tauler was an emotional yet practical mystic and left a large number of sermons full of evangelistic life. *The Book of Spiritual Poverty*, formerly ascribed to him, has been more recently regarded as a compilation. See a translation of extracts, *Golden Thoughts from the Book of Spiritual Poverty* (Edinburgh, 1897). Of the various editions of Tauler's works, the Frankfurt edition of 1826 is the most complete.

Bibliography. C. Schmidt, *Johannes Tauler* (Hamburg, 1841); Susanna Winkworth, *Tauler's Life and Times* (London, 1857; new ed., New York, 1907); Nicolas von Basel, *Bericht von der Bekehrung Taulers*, edited by C. Schmidt (Strassburg, 1875); W. Preger, *Geschichte der deutschen Mystik*, vol. iii (Leipzig, 1893); A. W. Hulton, *The Inner Way; 36 Sermons from John Tauler* (ib., 1905); *Conferences and Sermons of John Tauler*, translated by Rev. W. Elliott (Washington, 1911). See also **MYSTICISM**.

TAUNTON, tän'ton. The capital of Somersetshire, England, in the valley of the Tone, 38 miles southwest of Bristol (Map: England, D 6). The streets are wide and are well paved. The Church of St. Mary is of Perpendicular architecture, and is famous for its ornamented tower; that of St. James was the conventual church of an Augustinian priory. Taunton has an extensive museum in the remains of the Norman castle. It has manufactures of silk, gloves, and hosiery. Ina, King of the West Saxons, built a castle in Taunton about 700 A.D. This was soon after destroyed, but another fortress was built on the site soon after the Conquest, at which period the town had a mint. Pop., 1901, 21,078; 1911, 22,563. Consult Toulmin, *History of Taunton* (Taunton, 1822).

TAUNTON. A city and one of the county seats of Bristol Co., Mass., 36 miles south of Boston; on Taunton River, and on the New York, New Haven and Hartford Railroad (Map: Massachusetts, E 5). It is regularly laid out with finely shaded streets, and has many handsome residences. Among its institutions are a State Insane Hospital, Morton Hospital, the Old Ladies' Home, and Bristol Academy. The Public Library contains 55,000 volumes. Other important collections are the Bristol County Law Library and that of the Old Colony Historical Society. The city hall, county courthouse, the post office, registry of deeds, and the jail are buildings of merit. There are several pleasure grounds, of which Taunton Green and Woodward Springs Park are the more noteworthy.

Taunton carries on a large trade, being the business centre of a number of towns in the vicinity. It has also important industrial interests, the various establishments according to the census of 1909 having \$16,504,000 capital, and an output valued at \$15,380,000. The principal manufactures are cotton goods, stoves, and silverware. There are machine shops, wood-working establishments, and manufactories of copper ware, tacks, wire nails, stove lining, carriages, buttons, boxes, oilcloth, brick, printing presses, twist drills, cotton machinery, aluminium goods, pearl jewelry, eyelets, etc. The iron industry was established here in 1652.

The government is vested in a mayor and nine councilmen, elected at large. The water works, and the electric-light plant, are owned by the municipality. Pop., 1900, 31,036; 1910, 34,259; 1915 (State census), 36,161; 1920, 37,137.

Settled in 1638 as Cohannat, Taunton was incorporated under its present name in 1639. It was made a shire town in 1746 and was chartered as a city in 1865. The first permanent settlement in Vermont was made by a company from Taunton in 1736. Consult *Quarter-Millennial Celebration of the City of Taunton* (Taunton, 1889); Emery, *History of Taunton* (Syracuse, 1893).

TAUNTON, BARON. See **LABOUCHÈRE, HENRY**.

TAUNUS, tou'nus. A mountain range of west Germany, in the Prussian Province of Hesse-Nassau, extending about 55 miles in a northeast direction from the right bank of the Rhine near its confluence with the Main (Map: Germany, C 3). It consists mainly of schists and quartzites, and reaches its highest elevation, 2713 feet, in the northeast. It is steepest, however, in the southwest, where many crags are crowned with ruined castles. The higher portions of the range are forest-clad, and the lower slopes are covered with vineyards yielding some of the best of Rhenish wines. The range is famous for numerous mineral springs, including those of Wiesbaden, Homburg, and Nauheim.

TAURIC CHERSONESE, tə'rik kēr'sō-néz. See **CHERSONESUS**, 2; **IPHIGENIA**.

TAURIDA, tou'ri-dā. A government of European Russia, consisting of the peninsula of the Crimea (q.v.) and a portion on the mainland connected with the peninsula by the Isthmus of Perekop (Map: Russia, D 5). Area, about 24,497 square miles. No other government in European Russia presents such striking natural contrasts as this. The region north of the isthmus is mostly flat and its climate is considerably colder than that of the peninsula. The principal river of the mainland portion is the Dnieper, which forms its northwest boundary.

This part of the government is well adapted by its steppelike surfaces for stock raising. Large numbers of merino sheep are reared. Wheat, rye, barley, and oats are produced extensively. The cultivation of industrial plants and fruits is confined principally to the peninsula. The chief manufactures are flour, tobacco, and some iron products. The population is very cosmopolitan. In 1912 it numbered 1,965,900, of whom the Russians constituted about 71 per cent and the Tatars about 13 per cent. The capital is Simferopol (q.v.). See CRIMEA.

TAURIDA, PRINCE OF. See POTEKIN, G. A.

TAURIN (from Lat. *taurus*, bull, so called because first discovered in the bile of the ox), or AMIDO-ETHYL-SULPHONIC ACID, $C_2H_4(NH_2)SO_3H$. A substance occurring, as a constituent of taurocholic acid, in the bile and in other animal products and tissues. When pure it forms six-sided glistening prisms, perfectly transparent, neutral, devoid of odor, soluble in water, but insoluble in alcohol and ether.

TAURUS. A series of mountain ranges in the southern part of Asia Minor forming the southern boundary of the Anatolian Plateau, which covers the central part of the peninsula (Map: Turkey in Asia, C 3). It follows the Mediterranean coast from the Euphrates towards the Aegean Sea. On the north it slopes gradually towards the plateau, but on the south it falls in steep terraces towards the sea. The Taurus has many peaks above 10,000 feet, being highest near the eastern end. Between the ranges rivers flow to the sea from the inner plateau. A north-eastern extension from the Sihun River in alignment with the eastern Taurus is known as the Anti-Taurus.

TAURUS (Lat., bull). The second sign of the zodiac (q.v.), its conventional symbol being ♉. The constellation Taurus contains the two famous star groups known as the Pleiades and the Hyades (qq.v.), in the latter of which is situated the brilliant red star Aldebaran (q.v.). Other interesting objects in this constellation are λ Tauri, an Algol variable with a period of 3.9 days, and the Crab nebula, so called from its shape.

TAUSEN, tou'sen, HANS (1494-1561). A Danish leader in the Reformation, born at Birkende, in Fyn. From 1523 to 1525 he studied at Wittenberg under Luther, after his return fearlessly preaching the doctrines of the Reformation. He met great antagonism from the clergy, but was popularly successful. In 1537 he became professor of Hebrew in Copenhagen University, and in 1542 Bishop of Ribe. In worship he employed the people's mother tongue instead of Latin, wrote hymns, a postil, and pamphlets in Danish, and translated part of the Bible. Tausen was the first and one of the foremost of Danish followers of Luther, an able and powerful preacher, and gifted as a poet and linguist. H. P. Rørdam edited part of his writings in 1870.

TAUSIG, tou'sik, KARL (1841-71). A German pianoforte virtuoso, born in Warsaw. He received his first instruction from his father, and completed his education with Liszt in 1855-59. He became famous for technique and interpretative ability, and won a world-wide reputation by the concert tours that occupied his short life. He was connected with the musical life of Dresden (1859-60), Vienna (1862), and Berlin (1865), in which latter city he founded a "Schule des höheren Clavierspiels," which he

gave up in 1870. Of his composition and arrangements the great proportion are classical pianoforte works which he edited. He also prepared and edited a new edition of Clementi's *Gradus ad Parnassum*, and arranged the piano score of Wagner's *Meistersinger*. He composed and published two *Etudes de concert* (F# and Ab), also *Ungarische Zigeunerweisen*, *Nouvelles soirées de Vienne*, and *l'alses-Caprices* on themes from Strauss.

TAUSSIG, tous'sig, FRANK WILLIAM (1859-). An American economist, born in St. Louis. He graduated at Harvard in 1879, and after teaching there for 10 years, became professor of economics in 1892. In 1904-05 Taussig was president of the American Economic Association. His publications include: *The Tariff History of the United States* (1888; 6th ed., rev., 1914), a standard work; *Protection to Young Industries as Applied to the United States* (1883; 2d ed., 1886); *History of the Present Tariff, 1860-83* (1885); *The Silver Situation in the United States* (1892; 3d ed., rev., 1896); *Wages and Capital* (1896); *Principles of Economics* (1911; 2d ed., 1915); *Some Aspects of the Tariff Question* (1915); *Inventors and Money Makers* (1915), Brown University lectures. He also edited *State Papers and Speeches on the Tariff* (1892); and for some years was editor in chief of the *Quarterly Journal of Economics*.

TAU-TAI. See TAOTAI.

TAU'TOG (Massachusetts Indian *tautauog*, pl. of *taut*, sheep's head, the Indian name of the fish). An American food fish (*Tautoga onitis*) of the family (Labridæ) to which the wrasses of Europe belong. It is found from Maine to South Carolina, especially along the coast of southern New England, on rocky and weedy bottoms, where it lives on mollusks, crustaceans, worms, sand dollars, etc. It is abundant, is of considerable importance as a food fish, and is locally known as blackfish and oysterfish. It may attain an extreme weight of 22 pounds, with a length of 3 feet, but the average weight is about three pounds. The annual catch amounts to about 1,500,000 pounds, valued at \$60,000. The tautogs spawn in May and June, and are very prolific, a large fish yielding more than a million eggs, which are small and buoyant, and hatch in four or five days. Consult G. B. Goode, *Fishery Industries*, sec. i (Washington, 1884); Jordan and Evermann, *American Food and Game Fishes* (New York, 1905).

TAVERNER, RICHARD (c.1505-75). An English religious writer. He was born at Brislley, Norfolk; graduated at Oxford in 1529; was clerk of the signet under Thomas Cromwell, and managed to retain court favor after Cromwell's fall (1540). In 1545 he was returned to Parliament, and by the King's gift came into possession of much property. Under Edward VI he maintained his position. Early won for the Reformation and the author of a translation of the Augsburg Confession (1536) and other original and translated works in the interest of Protestantism, and a licensed lay preacher under Edward VI, he still was unmolested by Mary, although he lost his office. Under Elizabeth he came again into royal favor and was high sheriff at Oxford (1569). Taverner's principal literary work was a revision of Thomas Matthew's Bible of 1537, upon the suggestion of Thomas Cromwell. It was the first complete Bible ever printed in England (London, 1539).

TAVERNIER, tá'vár'nyá', JEAN BAPTISTE,

BARON D'AUBONNE (1605-89). A French traveler, born in Paris. He became a dealer in precious stones, and between 1638 and 1663 made a number of journeys to Turkey, Persia, India, and the East Indies. His *Six Voyages en Turquie, en Perse, et aux Indes* (1676), edited by Chappuzeau and La Chapelle, went through many editions. Consult V. Ball's translation, *Travels in India* (1889), with a biographical sketch of Tavernier.

TAVIRA, tâ-vê'rá. A seaport town of the Province of Algarve, Portugal, 136 miles southeast of Lisbon, on both sides of the river Gilão, at its mouth (Map: Portugal, B 4). The harbor is navigable for small vessels and affords an important commerce in mineral waters and white wines. The town has also sardine and tunny fisheries. Pop., 1900, 12,178.

TAVISTOCK. A market town in Devonshire, England, picturesquely situated on the west border of Dartmoor, about 35 miles southwest of Exeter, and 12 miles north of Plymouth, in the fertile valley of the Tavy, which is crossed by two bridges within the town (Map: England, B 6). There are iron foundries and mining works, copper, lead, tin, and iron being found in decreasing quantity in the neighborhood. The parish church, dating from 1318, is a handsome edifice. Tavistock was formerly of great importance, owing to its abbey, the largest and most magnificent in Devonshire, which was founded in the year 961, for the Benedictine Order. The refectory and abbey gateway still exist. Pop., 1901, 5043; 1911, 4392.

TAVOY, tâ-voi'. The capital of a district of the same name in Tenasserim, Lower Burma, 160 miles west by north of Bangkok, on the Tavoy River, 30 miles from its mouth (Map: Burma, C 4). It is the shipping point for the rice and fruit of the surrounding region, and manufactures earthenware, silk, and salt. Tavoy has been a British possession since 1824. Pop., 1901, 22,371; 1911, 25,063.

TAVRIS, tâ-vrê's'. A town of Persia. See TABRIZ.

TAWAKONI, tâ-wâ'kô-nê. An important Caddoan tribe of the Wichita group (q.v.). See WACO.

TAWING. See LEATHER.

TAWNY, or **TENNÉ**. The term for orange color in heraldry (q.v.), represented in engraving by diagonal lines running from the sinister chief point and crossed by horizontal lines.

TAX, SINGLE. See SINGLE TAX.

TAXACEÆ, tâks-â'sê-ê. A family of Conifers including forms commonly called yew, ground hemlock, etc. It comprises 5 genera and about 20 species, occurring chiefly in the Northern Hemisphere. Formerly it included the Podocarpaceæ (see *PODOCARPUS*) of the Southern Hemisphere. The most familiar North American representative is *Taxus canadensis* (American yew, ground hemlock, etc.).

TAX AND TAXATION (OF., Fr. *taxe*, from ML. *tava*, *tasca*, taxation, tax, from Lat. *taxare*, to touch, rate, appraise, estimate). A tax is a compulsory contribution from private income or wealth to meet the general expenses of government. The purpose of taxation is primarily the securing of revenue, although it may incidentally subserve political, social, or moral ends. The common element in all forms of taxation is the destination of the revenue derived from them—to cover general expenses of government. This characteristic serves to distinguish from taxes

such compulsory payments as fees and special assessments (see *ASSESSOR*), which are primarily payments to meet costs incurred in affording special public services to the individuals who pay them.

Taxation, while it is to-day by far the most important source of public revenue, is of comparatively recent origin. The mediæval state depended for its revenues largely upon the product of the public domain. (See *FINANCE*.) It was in the cities that taxation first developed. Payment of taxes was generally regarded as prerequisite to citizenship. With the increase in public needs which accompanied the development of the national state various forms of indirect taxes—tolls, import duties—were levied and with the extension of citizenship characteristic of the modern state the duty of paying taxes has become practically universal. The broadening of the functions of the state, noted under *FINANCE*, has had the effect of making taxation an increasingly important element in economic life. In general the higher the social and economic development of a nation, the heavier is the burden of taxation upon its citizens.

Principles of Taxation. Writers on finance are accustomed to lay down certain general principles of justice and of administration to which practical systems should conform. Taxes should be capable of yielding a large revenue; they should be economical, i.e., the cost of collection should not materially increase the burden imposed upon the taxpayer; they should be elastic, capable of responding to a sudden demand for revenue; they should not impair their source through discouraging industry. So far as possible they should be collected in such a way as to cause the taxpayer the least inconvenience; they should be certain, so that each man might know what he might be expected to pay and make provision accordingly. Most important of all, they should be equitably distributed.

On what principle the distribution of taxes should be made is a question on which financial theorists are far from an agreement. In the first half of the nineteenth century most writers regarded a tax as a payment to the state for protection or for the privilege of securing an income under the laws of the state. It followed from this view that taxes should be distributed according to the benefit received or according to the cost incurred by the state in affording the benefit. Such a principle proved unsatisfactory, since both benefit and cost are indeterminable. In recent years the doctrine which has the widest following teaches that, since civilized existence is conditioned by the state, each individual is born with the duty of contributing to the needs of the state in proportion to his ability or faculty. This theory more nearly than any other corresponds with public sentiment and with the actual practice of taxation.

Proportional, Progressive, and Degressive Taxation. A system of proportional taxation is one in which the contribution from income or wealth remains a constant percentage, whatever the size of the latter may be. It is defended on the ground that it approximates the ideal of taxation according to ability. Progressive taxation, in which the contribution increases relatively to income or wealth, may be defended on the same ground, since one who possesses a large income is obviously more able to surrender a certain percentage of it than one who has a small income is to surrender an equal percentage.

More often it is advocated as a measure of social equalization. Degressive taxation, in which the contribution diminishes relatively to income or wealth, has no valid defense; it exists only because of the imperfection of the taxing machinery, which finds less difficulty in levying upon small aggregates of wealth than upon large.

An ideal system of taxation would be a single tax on incomes. Such a tax would have to take account of the necessary expenditures of individuals, since these affect faculty; it would also take account of the character of income, whether funded or unfunded, since the former, being more certain, places its recipient in a better economic position than the latter. Income taxes, however, have proved practicable to only a limited extent. (See below.)

A tax on all property would approximate the same end, since the value of property is closely dependent upon the income it yields. This tax was practicable enough when almost all property was tangible and incapable of concealment. It is the most unsatisfactory of systems when, as at present, a vast amount of property consists in intangible personality. For these reasons a multiple system of taxation, direct and indirect, is necessary to provide satisfactory revenues and to approximate fairness in distribution.

Shifting and Incidence of Taxation. The problems of taxation are immensely complicated by the fact that a tax may not rest upon the persons who pay it in the first instance, but may be shifted in whole or in part through price changes. A tax upon the output of a factory would naturally result in an equal rise in price. The manufacturer might pay the tax, but its ultimate incidence is upon the consumer. A tax on houses might temporarily be borne by the owner, but in the nature of the case it would ultimately result in higher rents, since it would put a check upon building. A tax on land value, on the other hand, could not be shifted, since it would not affect the amount of land available for use, and hence could not raise rents.

Capitalization of Taxation. Closely allied to the phenomenon of shifting is that of capitalization. A special tax falling upon an income-yielding property from which it cannot be shifted, e.g., a landed holding, tends to depress the value of the property by the capital value of the tax. Subsequent purchasers of the property are not burdened by the tax, since full allowance for it is made in the purchase price.

Direct and Indirect Taxes. A classification of taxes of much practical importance is that which distinguishes between direct and indirect. The distinction cannot be sharply drawn, but it may in general be said that direct taxes are those which are levied upon the persons or property of those upon whom they are expected to rest, while indirect taxes are levied upon commodities or industrial processes with the expectation of their further diffusion. Examples of the former kind are the poll tax, the general property tax, and the income tax. Examples of indirect taxes are customs duties and excise taxes. The practical advantage of indirect taxation lies in its ease of collection and in the fact that it creates a minimum of opposition on the part of the taxpayer, who does not recognize that he is paying a tax through the enhancement of price of articles which he may purchase or not as he chooses. This very fact gives rise to one of the chief disadvantages of such taxation, viz., that it encourages wasteful administration, since

the financier is not held to such strict account for funds raised in this way. A further objection to indirect taxation is that it weighs most heavily upon the poor, since it is only commodities in general use which can yield a considerable revenue through indirect taxation.

Forms of Taxation. The simplest form of taxation is the poll tax, a head tax levied equally upon all citizens or inhabitants. This tax was not uncommon in England towards the close of the Middle Ages; it was an important form of taxation in the New England colonies. Where it still exists it is of minor importance. A tax on general property was developed in the northern Colonies of America. Taxes on houses are discussed under the title **HOUSE TAX** (q.v.).

A notable development in taxation has been the imposition in many countries of special taxes upon the land. In almost all the cities of New Zealand local revenues are raised chiefly from proportional taxes upon the unimproved value of the land, and the same system is widely employed in Australia and western Canada. A trace of the same system appears in the Pennsylvania law permitting the cities of Pittsburgh and Scranton to introduce gradually heavier rates on land than on buildings. New Zealand also has state taxes graduated according to the size of holding and special taxes on absentee holdings. Western Canadian communities levy special taxes on unimproved land, and the same principle appears in the British system adopted in 1910-11. Germany and England also levy taxes upon the increase in value of land, as indicated by prices at successive transfer, or by appraisal.

For inheritance tax see that title.

The chief forms of indirect taxes are customs duties (see **TARIFF**) and excise taxes, or taxes upon the production or sale of commodities. The latter are common wherever business is highly developed. They are employed in England to offset duties on imports, which would otherwise serve to protect the native producer.

Taxation in the United States. There are no constitutional restrictions upon the power of the Federal government over taxation save that "no capitation or other direct tax shall be laid unless in proportion to the census or enumeration," "no tax or duty shall be laid on articles exported from any State," "no preference shall be given . . . to the ports of one State over those of another," and "that all duties, imposts, and excises shall be uniform throughout the United States." The power of the States to tax is also practically unlimited, except that they may not tax interstate commerce, levy import or export duties, or exercise the right of taxation in a manner to impair the obligation of a contract or to confiscate property without due process of law. The State constitutions in many cases place further limitations upon the power of taxation exercised by the State governments. The two fields of national and State taxation have been on the whole well defined and separate since the adoption of the Federal Constitution. While there is no legal objection to the right of the State to levy excise taxation, the prohibition of taxation of like commodities entering the State by interstate commerce renders this right nugatory; the States are therefore practically confined to direct taxation, and the Federal government has refrained from entering this field of taxation except in periods of great national emergency. Areas of conflict do, however, ap-

pear in the income, corporation, and inheritance taxes. Both income and inheritance taxes are employed by the Federal government and some of the States. While the inheritance tax has not been employed by the Federal government except in emergencies, the trend of financial opinion favors the adoption of a Federal tax.

State Taxation. In the majority of the United States the basis of the fiscal system is found in the general property tax, levied both for State and local purposes, on realty and personality of the inhabitants of the State. This tax, although general, has long been severely criticized by taxation experts. Recent tendencies have been in the direction of breaking up the general property tax through the separate treatment of special forms of property, especially corporate property, and the relegation of the tax on general property to local purposes. Confined to tangible property and levied for local purposes, the tax on property may, in the opinion of experts, be stripped of most of its abuses. Through the inefficiency and occasional dishonesty of assessors, and through their frequent dependence upon popular favor, property of all sorts, and more especially personal property, escapes its just burdens, while in many cases the system of basing the taxation of the State upon the local assessment leads to a competition among the various districts of the State to keep their local assessment unreasonably low and thus evade, as far as possible, the burden of the State general property tax. The resulting inequalities are only partially remedied by the various State boards of equalization which now exist in about one-half of the States and which exercise the right to raise or lower the assessment of counties and in cases even to alter the assessment of individuals. It has, moreover, been found impracticable to secure good results by imposing severe penalties for evasion or by paying portions of the tax to persons discovering such evasions.

Mortgages are taxed in most States together with the other forms of personality, and as no deduction is usually made in the assessment of mortgaged property, the imposition of the tax on mortgages usually amounts to double taxation. Attempts have been made in Massachusetts, California, Oregon, and elsewhere to prevent this double taxation of mortgaged property.

In connection with the general property tax many of the Southern States also depend upon a number of license or privilege taxes upon various forms of business or exhibitions. In the South the tax is not graduated, but is usually a fixed charge, and according to Seligman (*Essays in Taxation*) is the natural result of the economic constitution of the South in the past. The aristocratic landed interests did not desire to tax themselves by land or poll (slave) tax, but attempted to shift the burden in Colonial days by taxing imports and exports and, after the adoption of the Constitution of the United States, by levying business taxes or licenses.

A few States levy an income tax, in some cases instead of the general property tax, in others in connection with it. The income tax law of Massachusetts has survived from Colonial days. It exempts incomes under \$2000, taxing only the excess, and exempts also the income from property already taxed. It is laxly administered. The Wisconsin income tax law, as a result of excellent administration, has proved to be a satisfactory source of revenue and has led to a change of view among taxation authorities

as to the practicability of State income taxes as a minor source of revenue.

The assessment of the property of corporations by local bodies under the general property tax has everywhere been found to be inadequate, and the expedient has commonly been resorted to of assessing the property of such corporations by a State board instead of by local assessors. Corporations are taxed, however, on another basis than that of the value of their property. According to Professor Seligman the basis of taxing corporations in the United States has been: (1) the value of the property; (2) the cost of the property; (3) the capital stock at par value; (4) the capital stock at market value; (5) the capital stock plus the bonded debt at market value; (6) the capital stock plus total debt, both funded and floating; (7) the business transacted; (8) gross earnings; (9) dividends; (10) capital stock according to dividends; (11) net earnings; (12) value of franchise. Several States have accepted gross revenue or net earnings as a basis for taxation, and in several States, Wisconsin, Michigan, etc., this tax is progressive. A feature of recent taxation is the so-called special franchise tax. A tax of this sort which falls upon "franchises for the use of streets granted by municipalities to public-service corporations," was passed by the New York Legislature in 1890, and a somewhat similar tax was levied in New Jersey in 1900. One of the most serious drawbacks to the just and equitable taxation of corporations lies in the interstate location of their property and the interstate character of their business and the consequent frequent conflicts of jurisdiction. To prevent this Prof. Henry C. Adams advocates the Federal taxation of interstate commerce, while another authority on finance (Professor Seligman) urges uniformity of State action or, in default thereof, taxation by the Federal government and subsequent redistribution of such revenue among the States.

Federal Taxation. The revenue of the Federal government has been obtained principally from customs and internal revenue duties. Down to 1848 the internal revenue receipts were relatively insignificant except for the years 1814-18, when they averaged over \$3,000,000 as compared with customs receipts of about \$20,000,000. From 1849 to 1862 no internal revenues were collected. Under the stress of the Civil War a vast number of internal duties were imposed, and from 1864 to 1868 the internal revenues exceeded the customs in yield. After the restoration of normal conditions the internal revenue receipts fell to a level somewhat below the customs and except sporadically did not surpass the customs until the years of the Spanish War finance (1898-1902). Since 1911 the internal revenue receipts have uniformly exceeded the customs receipts, partly in consequence of the two new elements—the corporation tax, first affecting yield in 1910, and the income tax, affecting yield in 1914. For American and foreign policy of taxation during and after the war see articles FINANCE, UNITED STATES and SUPPLEMENT.

Seligman, *Shifting and Incidence of Taxation* (3d ed., ib., 1910); id., *Essays in Taxation* (8th

ed., ib., 1913); id., *Income Tax* (2d ed., ib., 1914); R. M. Haig, *The Exemption of Improvements from Taxation in Canada and the United States* (ib., 1915); also references under FINANCE and POLITICAL ECONOMY.

TAXATION OF COSTS. The official confirmation of the amount of costs due a successful litigant. It is a ministerial act usually performed by the clerk of the court, but subject to review by the court. In England costs are taxed before a taxing master or registrar, and in Scotland before an auditor. See COSTS.

TAX DEED. An authenticated instrument by which a public officer transfers land sold for taxes. The validity of the deed depends upon the regularity of the tax sale and compliance with the statutes. Delivery of the deed may be compelled by mandamus or restrained by injunction. The deed is not made until after the time for redemption has expired. See TAX SALE.

TAXICAB. See MOTOR VEHICLE.

TAXIDERM/Y (from Gk. *râxis*, *taxis*, arrangement + *dërma*, *derma*, skin). The art of skinning, preserving, and stuffing the skins of animals, and of properly mounting them. All animals should first be carefully measured, according to measurements prescribed by taxidermists. Drawings and if possible casts should be made of parts whose form and expression are characteristic and can be expressed in no other way. These precautions have reference to the mounting of the animals in a lifelike attitude and form. Mounting requires experience and, for the greatest success, an artist's eye for form and a sculptor's skill in modeling. The skin should be carefully removed from the body to the tips of the toes and to the bill in the case of the bird. Directions as to where and how far to cut the skins of the various sorts of animals may be found in taxidermists' guides. The skin should not be cut at the claws and beak, and in the case of birds, the skull should be left within the skin. Clean the leg and skull bones of all flesh, clear out the brain, and preserve the skin and all it contains by anointing it thoroughly on the inside with arsenical soap. Many taxidermists prefer to have the entire pelvic and pectoral girdles preserved at least.

Subsequent treatment depends somewhat on whether the specimen is to be mounted, and upon the facilities at hand, and the ease and cost of transportation. Except in the case of young, and of certain species, the skins of mammals, whether preserved in the field or in the laboratory, should if possible be preserved wet, in a salt and alum bath. The proportions recommended by Hornaday are: to one gallon of water add $\frac{3}{4}$ of a pound alum (one pint) and $1\frac{1}{4}$ pounds salt (one quart); heat to near the boiling point until the crystals are all dissolved. When possible test with a salometer, where liquid should stand at 15° . Do not allow the liquid to remain in a zinc or galvanized vessel. Immerse the skins in the cooled solution. For the first two or three days do not allow the skins to crumple or fold, and to facilitate the penetration of the fluid to all parts of the skins stir them about in the fluid. Keep greasy skins by themselves and replace a dirty and bloody preservative by a clean one.

Skins for mounting should be preserved dry only when the lack of facilities and the cost of transportation render the wet method prohibitive. By the dry method the skins may be pre-

served with arsenical soap. When the soap is all absorbed the skins should be dusted with finely powdered salt and alum in equal proportions. Very good skins may be prepared with salt alone in an emergency; but such skins should be guarded against the attacks of insects, rats, mice, cats, dogs, etc.

Bird skins may be preserved either with powdered arsenic and alum or with arsenical soap. Before removing the skin of a bird plug the vent and nostrils with cotton. Dirt and blood spots should then be washed out with water and the feathers dried with generous and repeated sprinkling of meal, plaster of Paris, or sawdust. The skin having been removed and anointed with the preservative, replace the skull (using great care here as elsewhere not to stretch or tear the delicate skin); gently fill the eye sockets and throat with cotton to their natural fullness; wind the wing bones and legs with cotton to an amount equal to the muscles removed, and gently draw them down into the skin of the arms and legs, which should be placed in a natural position. Then make as close an imitation of the body as possible (of cotton for little birds and of tow for large ones), insert it into the skin, packing it in just sufficiently to fill out all the natural roundness and no more, and draw the skin over it. Next smooth all the feathers carefully, lay the wings naturally beside the body, and tie them there by many windings of thread round and round the whole length of the body. This done lay the bird on its back on a board, stretch out the beak and tail, and fasten them in position if necessary and leave the specimen in an airy place until thoroughly dried. A light label should be attached to the leg. Skins so preserved are better for study purposes than when mounted, as they are easily handled, take less room in a cabinet, and are more easily cared for. When properly preserved they may be prepared for mounting at any time by softening by means of wrapping in damp cloths.

The mounting of skins is a very elaborate process, and good results depend not only upon acquired skill, but upon a knowledge of anatomy, bionomics, and good artistic taste. In the case of the smaller birds and animals it consists of arranging wires lengthwise of the body and the limbs, so connected as to support the body in a lifelike attitude; but large animals must have the substance of the body replaced by some firm material, such as clay or some plastic composition, which must be modeled with great intelligence if the figure is to be satisfactory.

TAXILA, *tâks'i-lâ* (Lat., from Gk. *Tάξιλα*, from Skt. *Takṣakaṣṭa*, rock of Takshaka, a Naga king, or from Pali *Takkasila*, rock of the Takkas, a tribe living between the Indus and the Chenab). A famous city of ancient India. It was situated near the modern village of Dheri Shahan, on the little stream Tabranala, in the District of

Rāwalpindī, in the Punjab. It was one of the most populous and wealthy of all the cities of India, and seat of an important university famous for instruction in the medical sciences. It was the residence of Aśoka (q.v.) while he was Viceroy of the Punjab. The Sus or Abars became its masters in 126 B.C., only to lose it at the beginning of the next century to Kanishka, King of the Kushans. Consult: J. W. McCrindle, *Invasion of India by Alexander the Great* (London, 1896); id., *Ancient India as Described in Classical Literature* (ib., 1901); V. A. Smith, *Early History of India* (3d ed., Oxford, 1914).

TAXIS (Neo-Lat., from Gk. *táxis*, arrangement). A term applied by botanists to movements by free-swimming organisms, spores or sperms, in which the direction of the movement is determined by the direction of the applied stimulus. Similarly directed movements in fixed plant organs are termed tropisms. Zoölogists often use tropism to cover taxis as well. Tactic responses may be positive, in the direction of the stimulus source; negative, away from the stimulus source; or diatactic, at right angles to the lines of stimulus. They may be called forth by a variety of stimuli, as light (phototaxis), chemical nature of the substance (chemotaxis), or varying osmotic pressure of the medium (osmotaxy).

TAXONOMY (from Gk. *táxis*, *taxis*, arrangement + *nómos*, *nomos*, law, from *némein*, *nemein*, to distribute) IN PLANTS. The classification of plants. Probably the first scientific study of plants was the attempt at classification. Artificial classifications, beginning with the most ancient one into herbs, shrubs, and trees, and culminating in the Linnæan system (see BOTANY) in the middle of the eighteenth century, were at first necessary on account of lack of knowledge of the structure of plants. Such classifications simply catalogued and pigeon-holed the rapidly accumulating material, in preparation for a classification based upon natural relationships. Natural systems have been evolving since the eighteenth century; being modified by every advance in morphological knowledge, none are abreast of current opinion, and no final classification seems to be in sight. Each newly proposed system, however, approaches to it. The present system is a composite one, not being referable to any single systematist, but having had a somewhat natural and very slow development. In its larger outlines it is presented below. All of the groups mentioned are described under their several titles.

At present four primary divisions of the plant kingdom are recognized, as follows:

- IV. Spermatophytes or Seed plants.
- III. Pteridophytes or Fern plants.
- II. Bryophytes or Moss plants.
- I. Thallophytes or Thallus plants.

These categories are distinct enough, and there is no difficulty in assigning all plants to them; but the question arises: Are they equivalent groups? Some think there should be more primary groups, and others fewer. Beginning with the lowest great division there is an increasing complexity. An easy differential way of separating the groups is as follows: *Thallophytes* have thallus bodies but no archegonia (q.v.); *Bryophytes* have archegonia but no vascular bundles; *Pteridophytes* have vascular bundles but no seeds; *Spermatophytes* have seeds.

I. Thallophytes, the least natural group of

the four, comprise what seems to be a heterogeneous mass of forms. They are divided into two great parallel series, algae and fungi, the former containing chlorophyll (green pigment) and being independent plants, the latter containing no chlorophyll and being parasites or saprophytes. The algae are usually subdivided as follows:

- Algae { Rhodophyceæ or red algae.
Phæophyceæ or brown algae.
Chlorophyceæ or green algae.
Cyanophyceæ or blue-green algae.

It is a serious question whether the Cyanophyceæ should be included in this way with the other algae, for they appear to be far more nearly related to the bacteria, a group of fungi. The classification of the fungi is in a very unsatisfactory state, but the plants are for the most part being treated under the following heads:

- Fungi { Basidiomycetes or basidium fungi (toadstools and their allies, including rusts and smuts).
Ascomycetes or sac fungi (mildews, lichen fungi, etc.).
Phycomycetes or algalike fungi (molds, downy mildews, etc.).
Schizomycetes or fission fungi (bacteria).
Myxomycetes or slime molds.

The first three groups are regarded as true fungi; the last two are problematical as to their relationships, often being regarded as distinct from the fungi.

II. Bryophytes form a very natural group, the two great series being liverworts (*Hepaticæ*) and mosses (*Mucci*). Their principal subdivisions are as follows:

- Bryophyta { Musci { Bryales.
Sphagnales.
Hepaticæ { Anthocerotales.
Jungermanniales.
Marchantiales.

III. Pteridophytes also form a natural group, though the main divisions are very dissimilar in appearance. The prominent existing groups are as follows:

- teridophyta { Lycopodiales or club mosses.
Equisetales or horsetails.
Filicales or ferns.

IV. Spermatophytes should probably be divided into two primary groups, although at present they are treated as one. The two great divisions, gymnosperms and angiosperms, differ more in essential features from one another than does the former group from pteridophytes, but they are held together at present by the common character of seed production. The existing gymnosperms are grouped as follows:

- Gymnospermæ { Gnetales.
Coniferales (pines and their allies).
Ginkgoales (maiden-hair tree).
Cycadales (cycads).

The angiosperms comprise a vast assemblage of forms that are easily separated into two great series, monocotyledons and dicotyledons, but whose further division is at present in a somewhat chaotic state. Most of the subdivisions heretofore suggested are confessedly artificial, and probably as far as one may go safely with natural groups is as follows:

- Angiospermæ { Dicotyledones.... { Sympetaleæ.
Monocotyledones. { Archichlamydeæ.

The unit of classification used by taxonomists is the species, a group very difficult to define, but understood in a general way. The species always bears two names, as *Quercus alba*, the systematist's name for white oak, *alba indica*.

ting the species, and *Quercus* the genus to which the species belongs. In some cases forms of a species may be distinct enough to be characterized, and are called varieties, being designated by adding a third name to the species binomial. The next higher taxonomic group is the genus, which comprises one or more species. For example, *Quercus* is the oak genus, containing many species. The next higher taxonomic category is the family, which comprises one or more genera, and is indicated except in a few exceptional cases by the common termination "aceæ," as "Rosaceæ," the rose family. The next higher category is the order, the form of whose designation is not so fixed as that of the family, but which is increasingly indicated by the termination "ales," as "Coniferales." Still higher categories are often employed, but the usage is so variable that nothing definite can be stated in reference to them. All of these categories have their intermediate subdivisions, which general usage has in the main established. For example, a genus may have its species grouped into subgenera; a family may be broken up into tribes, each containing its own genera; and an order often has its suborders.

The literature of taxonomic botany is vast in extent, and a complete list of even the most important works cannot be cited. No work as yet contains a systematic presentation of all the known species of plants. The most extensive current works are as follows: Engler and Prantl, *Die natürlichen Pflanzenfamilien* (Leipzig), completed in four sections, each containing numerous parts, and including all known genera; Benthām and Hooker, *Genera Plantarum* (London, 1863-83), including all known genera of flowering plants; Engler, *Das Pflanzenreich* (Leipzig), many parts of which have appeared, and which is planned to be completed in 20 years, including descriptions of all known species of plants.

Each country has its own manuals containing descriptions of its flora. The current manuals dealing with the flowering plants and in some cases the fern plants of the United States are as follows: Gray, *Manual of Botany* (7th ed., rev. by Robinson and Fernald, New York, 1908), including northeastern United States; Britton and Brown, *Illustrated Flora of the Northern United States and Canada* (ib., 1896-98); N. L. Britton, *Manual of the Flora of the United States and Canada* (ib., 1901), including the same range; A. W. Chapman, *Flora of the Southern United States* (3d ed., Cambridge, Mass., 1897); J. K. Small, *Flora of the Southeastern States* (New York, 1903), including region south of Maryland and Kentucky west to 100th meridian; Coulter and Nelson, *New Manual of Rocky Mountain Botany* (ib., 1909); E. L. Greene, *Manual of the Botany of the Region of San Francisco Bay* (San Francisco, 1894); Thomas Howell, *A Flora of Northwest America* (Portland, Oreg., 1903); P. A. Rydberg, *Flora of Montana* (New York, 1900); id., *Flora of Colorado* (Fort Collins, Colo., 1906); Piper, *Flora of the State of Washington* (Washington, D. C., 1906). Manuals for various other regions are appearing as the demand for them develops. An attempt to include in a single work the whole vascular flora of North America is Asa Gray, *Synoptical Flora of North America*, incomplete (1874-97). The most inclusive work is *North American Flora* (New York Botanical Garden), presenting the whole plant kingdom within its

range. Each group is presented by specialists and many parts have appeared. For the important taxonomic literature of algæ and fungi, see articles on the principal groups. See BOTANY.

TAX SALE. A public sale of land, by proper officials, for delinquent taxes assessed thereon. The requisites and details to be followed vary in the different States, but the general principles are common. The taxes must be constitutional and legally assessed; they must be due and unpaid; a proper return of the delinquency must have been made. The sale must be public and to the highest bidder, and it must be advertised to be held at a proper time and place. The whole proceeding must be strictly in conformity with the statute. As each particular parcel of land is liable for the taxes assessed upon that and no more, each parcel must be sold separately. In certain States, where a division is practicable, it is mandatory upon the tax collector to sell only such portion of the land as will satisfy the unpaid taxes. The purchaser is given a certificate, and the owner usually has a certain period to redeem upon payment of the taxes, interests, and costs. At the end of the period the purchaser is entitled to receive a tax deed (q.v.). See TAX AND TAXATION; TAX DEED; TAX TITLE.

TAX TITLE. The interest or title acquired by a purchaser of land at a tax sale. If the sale be valid, the validity of the title depends upon the failure of the owner to redeem within the proper time. Until the expiration of the time allowed for redemption the purchaser has practically only a right in the nature of a lien on the property. See TAX SALE.

In most States the deed is prima facie evidence of title in the purchaser. In many States, after the expiration of the time for redemption, a tax title is made superior to all other claims. In a few States, however, the purchaser gets only the right of the delinquent taxpayer, and therefore the title may be precarious. Tax titles are often considered uncertain because questions of a strict compliance with the statute as to the assessment, delinquency, and sale are involved. When the tax title of a purchaser in good faith proves to be invalid for any reason, he is generally allowed to recover the purchase price and may recover from the owner the actual value of any reasonable improvements he may have made. See TAX AND TAXATION; TAX SALE; TITLE.

TAY, tā. A river of Scotland with interesting changes in direction due to longitudinal and transverse valleys (Map: Scotland, E 3). It rises on the border of Argyllshire, and flows first eastward, traversing the beautiful Loch Tay, then southeast, and finally northeast as the Firth of Tay, a broad tidal estuary tributary to the North Sea, 10 miles below Dundee. It is 118 miles long and navigable for small vessels to Perth, though the mouth of the estuary is obstructed by sand banks. The estuary is spanned by an iron railroad bridge 3593 yards long.

TAY, Loch. A lake in West Perthshire, Scotland, situated in a rock basin, 355 feet above the sea level. It is about 15 miles long, with an average breadth of one mile, and varies from 100 to 600 feet in depth (Map: Scotland, D 3). Its picturesque features and salmon fishing make it a favorite tourist and angling resort. Ben Lawers, on its western side, rises 3984 feet.

TAYABAS, tā-yā'bas. A province of Luzon,

Philippine Islands, occupying the isthmian portion between the central and southern part of the island, and the region along the east coast of central Luzon, formerly included under the districts of Infanta and Principe (Map: Philippine Islands, C 3). These two districts and the large island of Polillo (q.v.) lying to the east of them were annexed to the province in 1902. Total area, 5993 square miles, of which the dependent islands take up 491, and of these the island of Polillo, 333 square miles. The entire mainland portion is occupied by a high coast range covered with forests and generally inaccessible and unexplored. The northern districts are undeveloped, but in Tayabas proper there are some agriculture and cattle raising, and considerable mechanical industries, including weaving, the manufacture of hats, cigar boxes, and coconut oil, and boat building. Pop., 1903 (exclusive of the subprovince of Marinduque), 153,065, almost entirely Tagalog. There are also some Negritos. Capital, Lucena.

TAYABAS. A town of Tayabas Province, Luzon, Philippines, situated on the east bank of the river of the same name, 65 miles southeast of Manila (Map: Philippine Islands, C 3). It is the centre of a large inland and coast trade, and has a dockyard. Pop., 1903, 14,740.

TAYGETUS, τὰ-ἱγ'ε-τῦς (Lat., from Gk. Ταῦρος), now called PENTEDAKTYLON. The principal mountain range of the Peloponnesus, Greece (Map: Greece, D 7). It extends southwestward from the west coast of the peninsula and forms the central one of the three promontories in which south Greece terminates. It reaches in Mount Hagios Elias an altitude of 7903 feet. It formed the ancient boundary between Laconia and Messenia.

TAYLER, JOHN JAMES (1797-1869). An English Unitarian clergyman. He was born at Newington Butts, London; graduated at the University of Glasgow in 1818; and was minister of a Unitarian congregation at Manchester (1820-53). In 1840 he was appointed professor of ecclesiastical history in Manchester New College, and in 1852 also professor of theology. When the college was removed to London (1853), he became its principal. With the Rev. James Martineau he was pastor of the Unitarian congregation in Little Portland Street (1859-60). He published *Christian Aspects of Faith and Duty* (2 series, 1851, 1877); *Attempts to Ascertain the Character of the Fourth Gospel* (1867; 2d ed., 1870). J. H. Thom published *Taylor's Life and Letters* (London, 1872).

TAYLOR. A borough in Lackawanna Co., Pa., 4 miles southwest of Scranton, on the Lackawanna River, and on the Central of New Jersey, the Delaware and Hudson, and the Delaware, Lackawanna, and Western railroads (Map: Pennsylvania, K 3). Its interests are coal mining and silk manufacturing. The place was settled in 1790 and incorporated in 1893. Pop., 1900, 4215; 1910, 9060; 1915 (U. S. est.), 11,591.

TAYLOR. A city in Williamson Co., Tex., 35 miles northeast of Austin, on the Missouri, Kansas, and Texas, and the International and Great Northern railroads (Map: Texas, D 4). The buildings and grounds of the Fair Association, the city hall, and the artesian wells are noteworthy. Taylor is the centre of extensive cotton interests, and has considerable trade in farm produce, live stock, wool, etc., and manufactures of machine-shop products, flour and

cottonseed oil. The International and Great Northern Railroad maintains repair shops here. Pop., 1900, 4211; 1910, 5314.

TAYLOR, ALFRED EDWARD (1869-). A British philosopher. He studied at New College, Oxford, and was a fellow of Merton. He taught at Owens College, Manchester (1896-1903), was next frothingham professor of philosophy at McGill University, Montreal, and after 1908 held the chair of moral philosophy at St. Andrews. His writings include: *The Problem of Conduct* (1901); *Elements of Metaphysics* (1903); *Aristotle on his Predecessors* (1906); *Plato* (1908); *Thomas Hobbes* (1908); *Epicurus* (1911); *Varia Socratica* (1911); *Aristotle* (1912).

TAYLOR, ALFRED SWAINE (1806-80). An English toxicologist and medical jurist, born at Northfleet, Kent. He studied in the united hospitals of Guy and St. Thomas in 1823. In 1831 he began to deliver at Guy's Hospital the first English course of lectures on medical jurisprudence. In 1832 he became joint lecturer with Aikin on chemistry at Guy's, and he held this chair alone from 1850 to 1870. His *Manual of Medical Jurisprudence* (1844) and *The Principles and Practice of Jurisprudence* (1865) passed through many editions. He first drew attention to the great incentive for secret murder offered by life insurance, and to the possibility of arsenical poisoning from wall papers and other fabrics. Among his numerous writings was a *Handbook on Poisons* (1848).

TAYLOR, ANN (MRS. JOSIAH GILBERT) (1782-1866) and JANE (1783-1824). English writers for children, whose prose and verse were popular throughout the English-speaking world. They were born in London, but the family early removed to Lavenham, Suffolk, and later to Colchester. The sisters published jointly *Original Poems for Infant Minds* (1804), which was translated into German, Dutch, and Russian; *Rhymes for the Nursery* (1806, containing Jane's familiar "Twinkle, twinkle, little star"); and *Hymns for Infant Minds* (1808). After Ann Taylor's marriage they worked separately, without as much success. Their earlier work, marking an epoch in young people's literature, has held its own. E. V. Lucas edited *The Original Poems, and Others* in 1903, and in 1915 Mary Macleod edited *Ann and Jane Taylor* in the "Children's Poets Series." Their brother, Isaac Taylor (q.v.), edited *Memoirs and Correspondence of Jane Taylor* (2 vols., London, 1825), and Ann's son, Josiah Gilbert, edited *The Autobiography of Mrs. Gilbert* (ib., 1874).

TAYLOR, (JAMES) BAYARD (1825-78). An American poet, man of letters, journalist, and traveler, born at Kennett Square, Chester Co., Pa. His education was obtained in the common schools of the neighborhood. He became, in 1842, the apprentice of a printer, and here he published his first volume, *Ximena: or the Battle of the Sierra Morena, and Other Poems* (1844). In 1844-45 he made a pedestrian tour through Europe, describing his experiences in *Views Afoot: or Europe Seen with Knapsack and Staff* (1846). The following year, 1847, he joined the New York *Tribune*, and remained on the staff of that paper as long as he lived, publishing in its pages the sketches of many of his subsequent books. As its special correspondent, he visited California in 1849, where he spent five months among the gold diggers; two years later he was in Egypt, Asia

Minor, and Syria; in 1852-53 in India, crossing from Bombay to Calcutta, and then going to China to join the expedition of Commodore Perry to Japan. From 1862 to 1863 he was secretary of the United States legation at St. Petersburg, and later chargé d'affaires there, and was influential in securing for the northern States the sympathy of Russia. In 1874 he was again in Egypt, and the same year at the Millennial Celebration in Iceland. For several years previously he had lived in Germany, and there, and in America and England, in 1870 he brought out the work for which he is best known, his excellent translation of Goethe's *Faust*. In 1876 he wrote the *Ode* in honor of the opening of the Centennial Exhibition in Philadelphia. In February, 1878, he was appointed Minister to Germany, and went again to that country, but died there towards the end of the same year, leaving unfinished biographies of Goethe and Schiller. He was married in 1850 to Miss May Agnew, who died the same year, and in 1857 to Miss Marie Hansen of Gotha, Germany, who survived him, reëdited his works, and, with H. E. Scudder, wrote his *Life and Letters* (Boston, 1884).

Taylor's work is voluminous, and varied both in kind and in quality. He wrote books of travel, of which the chief are: *El Dorado: or Adventures in the Path of Empire* (1850); *A Journey to Central Africa* (1854); *A Visit to India, China, and Japan* (1855); *The Land of the Saracens* (1854); *Northern Travel* (1858); *Travels in Greece* (1859); *At Home and Abroad* (1859-62); *Colorado* (1867); *By-Ways of Europe* (1869); *Egypt and Iceland in the Year 1874* (1874); and others. His novels include: *Hannah Thurston* (1863); *John Godfrey's Fortunes* (1864); *The Story of Kennett* (1866); *Joseph and his Friend* (1870). His poems were also numerous; besides *Ximena*, the notable volumes are: *Rhymes of Travel, Ballads, and Other Poems* (1848); *A Book of Romances, Lyrics, and Songs* (1851); *Poems of the Orient* (1854); *Poems of Home and Travel* (1855); *The Poet's Journal* (1862); *The Picture of St. John* (1869); *The Ballad of Abraham Lincoln* (1869); *The Masque of the Gods* (1872); *Lars, A Pastoral of Norway* (1873); *The Prophet, A Tragedy* (1874); *Home Pastorals, Ballads, and Lyrics* (1875); and *The National Ode* (1876). Two posthumous collections of Taylor's miscellanies appeared—*Studies in German Literature* (1879) and *Essays and Notes* (1880). He had a distinct lyrical faculty, but he never seemed able to bring his varied powers under full artistic control. The public persisted in regarding him as a traveler and journalist rather than as a poet, and, despite the remonstrances of some friendly critics, it is probable that the public was right. At most he is a minor poet, a good translator, and a versatile writer of prose. Consult: Marie Hansen-Taylor (his wife) and H. E. Scudder, *Life and Letters of Bayard Taylor* (2 vols., Boston, 1884), and Mrs. Taylor, *On Two Continents: Memories of Half a Century* (New York, 1905); A. H. Smyth, *Bayard Taylor* (Boston, 1886), in "American Men of Letters"; W. D. Howells, *Literary Friends and Acquaintance* (New York, 1900); William Winter, *Old Friends* (ib., 1909).

TAYLOR, BERT LESTON (1866-1921). An American writer. He was born at Goshen, Mass., and was educated at the College of the City of New York. He joined the staff of the Chicago

Tribune, and in that connection became widely known for his humorous column called "A Line-o'-Type or Two." His writings include: *Line-o'-Type Lyrics* (1902); *The Well in the Wood* (1904); *The Log of the Water Wagon* (1905); *The Charlatans* (1906); *Extra Dry* (1906); *A Line-o'-Verse or Two* (1911); *The Pipesmoke Carry* (1912); *Motley Measures* (1913).

TAYLOR, Brook (1685-1731). An English mathematician, born at Edmonton, Middlesex. He was educated at Cambridge. In 1712 he was made a fellow of the Royal Society, and two years later became its secretary. Taylor is chiefly known for a theorem which bears his name, and which appeared in his *Methodus Incrementorum Directa et Inversa* (1715), the first important treatise to deal with the calculus of finite differences. Taylor also contributed in a valuable way to the problem of the centre of oscillation (*Philosophical Transactions*, xxviii), to the theory of vibrations of a string, and other questions of mathematical physics. His *Linear Perspective* (1715) and *New Principles of Linear Perspective* (1719) were a notable advance in the theory. They also contained an enunciation of the principle of vanishing points, the first in English and the most complete to that time. For biography consult the preface to his posthumous work, *Contemplatio Philosophica* (1793).

TAYLOR, CHARLES FAYETTE (1827-99). An American orthopedic surgeon, born in Williston, Vt., and educated at the University of Vermont. The year 1857 he spent in London, studying the Swedish movement cure under Roth. Subsequently he settled in New York City, and was one of the first to introduce the movement cure (see *MECHANOTHERAPY*) into America. Dr. Taylor became a specialist in orthopedic surgery, and was very successful. He was especially skillful in devising original appliances to meet deformities. Among his inventions are the Taylor splint for treatment of curvature of the spine and the long extension hip splint. He was the founder of the New York Orthopedic Dispensary and Hospital, of which he was the executive surgeon for many years. Taylor established in New York City an institute for the treatment of deformities, which was successfully operated for many years, previously to the organization of the hospital. He wrote much on the subjects in which he specialized.

TAYLOR, DAN (1738-1816). Founder of the New Connection of General Baptists. He was born in Yorkshire, England, where he worked in the mines till 1762. After having been for a year one of Wesley's preachers he seceded, but continued preaching. In 1763 he united with the General Baptists and rose to prominence as a preacher among them. In 1769 he headed a secession from that body. (See *BAPTISTS*.) His better known works embrace: *A Compendious View of Christian Baptism* (1772); *Fundamentals of Religion* (1775); and *The Eternity of Future Punishment* (1789, written against the Universalist Elhanan Winchester). Consult Adam Taylor, *Memoirs of Rev. Dan Taylor* (London, 1820), and W. Underwood, *Life of Rev. Dan Taylor* (ib., 1870).

TAYLOR, DAVID WATSON (1864-). An American naval constructor, born in Louisa Co., Va. He graduated with the highest honors from the United States Naval Academy in 1885, and received also the highest honors from the Royal College at Greenwich, England, where he studied in 1885-88. In the United States navy he was

promoted through the various grades to captain in 1901, and in 1914 became chief of the Bureau of Construction. He was awarded a gold medal by the British Institution of Naval Architects for the best original paper on "Ship-Shaped Stream Forms." Taylor published *Resistance of Ships and Screw Propulsion* (1893; 2d ed., 1907) and *The Speed and Power of Ships* (1910).

TAYLOR, EDWARD THOMPSON (1793-1871). An American preacher, widely known as Father Taylor. He was born in Richmond, Va.; was taken in charge by a lady near that city; ran away to sea at the age of seven, and for 10 years was a sailor. In the War of 1812 he served on a privateer, the *Black Hawk*, was captured, and was confined first at Melville Island and then in Dartmoor Prison, where he became the chaplain to his fellow prisoners, having joined the Methodist Episcopal church in 1811. After his release from prison he was successively a peddler of tin and ironware and a buyer of rags, and a farmer; was regularly licensed to preach in 1814; and in 1819 became an itinerant Methodist minister. In 1829 he was chosen minister of the newly established Seamen's Bethel in Boston, which position he held until 1868, when he resigned. He visited Europe in 1832 and Palestine in 1842, and was chaplain to the United States frigate sent with relief to Ireland during the famine of 1846. By his warmth of heart, his native wit, and his natural eloquence he gained a remarkable influence over his sailor auditors. Numerous anecdotes have been told to illustrate his wit and his power as a public speaker, and accounts of his eloquence may be found in Miss Martineau's *Retrospect of Western Travel*, in Buckingham's *America, Historical, Statistic, and Descriptive*, in Dickens's *American Notes*, in Miss Bremer's *The Homes of the New World*, and in Mrs. Jameson's *Commonplace Book of Thoughts, Memories, and Fancies*. Consult Haven and Russell, *Father Taylor, the Sailor Preacher* (Boston, 1872), and Robert Collyer, *Father Taylor* (ib., 1906).

TAYLOR, EMILY HEYWARD DRAYTON (MRS. J. MADISON TAYLOR) (1860-). An American miniature painter. She was born in Philadelphia, and studied there at the Pennsylvania Academy and in Paris under Cécile Ferrier. Good examples of her miniatures, which are carefully drawn and somewhat detailed and realistic in treatment, are those of President and Mrs. McKinley, Dr. S. Weir Mitchell, Mrs. Clement Newbold, Miss Edith Moore Taylor, Mrs. Eugene Hale, Mrs. Cyrus McCormick, Emmons Blaine. Mrs. Taylor made her residence in Philadelphia, became a member of the Pennsylvania Academy of Fine Arts and president of the Society of Miniature Painters, and received gold medals at London (1900) and at Charleston (1902). She collaborated with Anne Hollingsworth Wharton in *Heirlooms in Miniature* (1898).

TAYLOR, SIR FREDERICK WILLIAMS (1863-). A Canadian financier, born at Moncton, New Brunswick. He entered the service of the Bank of Montreal in 1878, by 1906 had become manager of the London branch, and in 1913 was appointed general manager at Montreal. During his eight years in London he became the head of British colonial banking interests there, and the Bank of Montreal was the medium through which \$500,000,000 of Canadian loans were placed on the London market, besides about

\$125,000,000, the proceeds of Canadian Pacific Railway stock issues.

TAYLOR, FREDERICK WINSLOW (1856-1915). An American efficiency engineer, born at Germantown, Pa. In 1883 he graduated M.E. from Stevens Institute of Technology. Between 1878 and 1889 he was employed by the Midvale Steel Company at Philadelphia as foreman, master mechanic, chief draftsman, and chief engineer. Thereafter he devoted himself to organizing the management of manufacturing concerns, including the Bethlehem Steel, Cramp's Shipbuilding, and the Midvale Steel companies. Taylor was the originator of scientific management in business, which quickly grew to an important movement. He patented about 100 inventions, and devised the Taylor-White process for treating high-speed tools, for which he received a gold medal at Paris in 1900. In 1906 he served as president of the American Society of Mechanical Engineers. Taylor was author of *Concrete, Plain and Reinforced* (1905; 2d ed., 1911), with S. E. Thompson; *Art of Cutting Metals* (1906); *Concrete Costs* (1912), with Thompson; *The Principles of Scientific Management* (1911; Fr. trans., 1916); *Shop Management* (1911). Consult C. B. Thompson, *Scientific Management* (Cambridge, Mass., 1914).

TAYLOR, GEORGE (1716-81). A signer of the Declaration of Independence, from Pennsylvania. He was born in Ireland, emigrated to America as a redemptioner in 1736, and, after serving a wealthy manufacturer as a clerk, married his employer's widow. He became very wealthy, was a member of the Provincial Assembly from 1764 to 1770, and on July 20, 1776, was chosen a member of the Continental Congress. He served only a short time, retiring in March, 1777. Consult John Sanderson, *Biography of the Signers to the Declaration of Independence*, revised and edited by R. T. Conrad (Philadelphia, 1847).

TAYLOR, GRAHAM (1851-). An American social worker, born at Schenectady, N. Y. He graduated from Rutgers College in 1870, and from the Reformed Theological Seminary at New Brunswick, N. J., in 1873. From 1880 to 1892 he was pastor of the Fourth Congregational Church at Hartford, Conn., for the last four years of this period serving also as professor of practical theology at Hartford Seminary. In 1892 he was appointed professor of social economics at the Chicago Theological Seminary, and from 1894 he was resident warden of the Chicago Commons Social Settlement, which he had founded. In addition he held the presidency of the Chicago School of Civics and Philanthropy, and served as an associate editor of *The Survey*. He wrote *Religion in Social Action* (1913), which is, in a sense, autobiographical.

TAYLOR, HANNIS (1851-). An American lawyer and diplomat, born at Newbern, N. C. He was educated at the University of North Carolina. From 1893 to 1897 he was United States Minister to Spain. Later he practiced law in Washington, D. C. He published *The Origin and Growth of the English Constitution* (2 vols., 1898-99), a work in which he attempted not only to trace the history of the English system of government, but also the growth therefrom "of the Federal Republic of the United States." Taylor published also *International Public Law* (1902); *The Science of Jurisprudence* (1908); *The Origin and Growth of the American Constitution* (1911). Taylor

championed the claims supporting Pelatiah Webster (q.v.).

TAYLOR, SIR HENRY (1800-86). An English poet, born at Bishop-Middleham in Durham. He began writing verses in the Byronic manner and was soon contributing clever articles to the *Quarterly Review*. Encouraged by Southey, whom he visited at the Lakes, he settled in London as a man of letters (1823). In 1824 he was given a clerkship in the Colonial Office, a post which he filled with great ability till his resignation in 1872. He made warm friendships with Mill, Lockhart, Rogers, Carlyle, Spedding, Aubrey de Vere, and many other literary men. In recognition of his services to the government and to literature, he was made K.C.M.G. (1869). His last years were passed at Bournemouth. Taylor's literary fame rests secure on *Philip Van Artevelde* (1834; performed by Macready, 1847), one of the most poetic tragedies since the Elizabethan age. Other tragedies in the same style but of less merit are *Isaac Commenus* (1827), *Edwin the Fair* (1842), and *St. Clement's Eve* (1862). *The Virgin Widow*, a dramatic poem (1850), is an experiment in romantic comedy. In 1847 Taylor published *The Eve of Conquest and Other Poems*. His strongest prose is represented by *The Statesman* (1836), a collection of ironical discourses on success, which were taken seriously; and by a charming *Autobiography* (1885; but privately printed, 1877), containing carefully drawn portraits of his early contemporaries. Consult his *Works* (author's ed., 5 vols., London, 1877-78); selection from poems in Miles, *Poets and Poetry of the Century* (ib., 1891); and *Correspondence*, edited by Edward Dowden (ib., 1888).

TAYLOR, HENRY CLAY (1842-1904). An American naval officer, born in Washington, D. C. He graduated at the Naval Academy in 1863, was assigned to the West Gulf Blockading Squadron, and took part in the battle of Mobile Bay (Aug. 5, 1864). After the Civil War he spent two years in the South Pacific station, and on his return home was detailed for duty at the Naval Academy. In 1868 he was promoted to the rank of lieutenant commander, and after taking part in a surveying expedition (1870-71) he again spent two years at the Naval Academy. In 1879 he was advanced to the rank of commander, and from 1881 to 1884 he commanded the *Svataro* on the Asiatic station. Two years after his return he was appointed commandant of the Norfolk Navy Yard, a post which he held two years. From 1893 to 1896 he was president of the Naval War College at Newport, R. I. In 1897 he was again ordered to sea service, and was appointed commander of the battleship *Indiana*. In the spring of 1898 he joined Admiral Sampson's fleet at Key West, and in May he took part in the bombardment of San Juan. The next month, with the *Indiana* and other war vessels, he conveyed General Shafter's army from Tampa to Santiago, and on July 3, when Cervera came out of the harbor, his vessel took an important part in the destruction of the Spanish fleet. After the war he was placed in command of the receiving ship *Vermont*, and in 1902 he was appointed chief of the Bureau of Navigation.

TAYLOR, HENRY LING (1857-). An American surgeon, born and educated in New York City (M.D., 1881, College of Physicians and Surgeons). He followed his father, Charles

Fayette Taylor (q.v.), in the practice of the latter's specialty. In 1902 he became professor of orthopedic surgery at the Postgraduate Medical School and Hospital, New York. He published *Orthopedic Surgery for Practitioners* (1909).

TAYLOR, HENRY OSBORN (1856-). An American scholar, born in New York City. He graduated at Harvard in 1878 and at Columbia Law School in 1881. From the former institution he received the degree of Litt.D. in 1912 and in 1915 he was made a member of the National Institute of Arts and Letters. In addition to a law book—*Treatise on Law of Private Corporations* (1884; 5th ed., 1902)—he published: *Ancient Ideals: A Study of Intellectual and Spiritual Growth from Early Times to the Establishment of Christianity* (2 vols., 1900; 2d ed., 1913); *The Medieval Mind* (2 vols., 1911; 2d ed., 1914); *The Classical Heritage of the Middle Ages* (1901; 3d ed., 1912); *Deliverance: The Freeing of the Spirit in the Ancient World* (1915).

TAYLOR, HOBART CHATFIELD CHATFIELD. See CHATFIELD-TAYLOR, H. C.

TAYLOR, ISAAC (1787-1865). An English miscellaneous writer, inventor, and artist, born at Lavenham, in Suffolk. He studied engraving under the direction of his father, with whom he executed the plates for Boydell's *Illustrations of Holy Writ* (1820), commended for their originality by Rossetti. Turning to literature, he joined the staff of the *Eclectic Review* (1818), for which he continued to write for many years. Some time before this he had begun the study of patristic literature and of Lord Bacon. He was known as the great lay preacher of his time. Of his publications we may mention: *The Elements of Thought* (1823; 11th ed., 1867), which grew out of his early studies of Bacon and the Church Fathers; a translation of the *Characters of Theophrastus* (1824), with etchings by himself; *The Natural History of Enthusiasm* (1829; 10th ed., 1845); *Saturday Evening* (1832), a devotional volume which had an immense sale in England and the United States; *Home Education* (1838; 7th ed., 1867); a translation of the *Jewish Wars of Josephus* (1847 and 1851); *Ancient Christianity and the Doctrines of the Oxford Tracts* (8 parts, 1839-40; 4th ed., 1844); and *The Spirit of Hebrew Poetry* (1861). Consult Taylor's *Memorials of the Taylor Family of Ongar* (London, 1867). See also TAYLOR, ANN and JANE.

TAYLOR, ISAAC (1829-1901). An English ecclesiastic, born at Stanford Rivers, Essex. He was educated at King's College, London (1847-49), and Trinity College, Cambridge (1850-53), and in 1857 became curate of Trotterscliffe, Kent. In 1885 he became canon of York Minster. He was the author of *The Liturgy and the Dissenters* (1860), and one or two other theological pamphlets; but was best known by his works on philology. His *Words and Places* (1864; 2d ed., 1865) was a work of great research as well as erudition. In *Etruscan Researches* (1874) Taylor tried to prove that Etruscan was not Indo-European, but was probably akin to the Ural-Altaic (q.v.) or agglutinative group of languages. In 1879 he published his *Greeks and Goths*, in which he developed his theory that the runes were of Greek origin. This was followed by his best-known work *The Alphabet* (2 vols., 1883; 2d ed., 1899), on which his scientific reputation mainly rests.

In 1889 came his *Origin of the Aryans* (2d ed., 1902; Fr. trans., 1895) which was important in overthrowing Max Müller's theory that central Asia was the primitive home of the Indo-European races. His last important publication was *Names and their Histories* (1896; 2d ed., 1897).

TAYLOR, ISIDORE JUSTIN SÉVÉRIN, BARON (1789-1879). A French antiquarian and artist. The son of an English-born French citizen, he was educated in Paris; he devoted his life chiefly to travel, though in 1838 he was appointed Inspector General of Fine Arts. His life work is mainly embodied in a marvelous series of 24 folio volumes entitled *Voyages pittoresques et romantiques de l'ancienne France*, the publication of which covered the entire period from 1820 to 1863, and engaged the services of such artists as Géricault, Ingres, H. Vernet, and Viollet-le-Duc (qq.v.) besides Baron Taylor's own drawings and the editorial assistance of Charles Nodier and A. de Cailleux. The art of lithographic illustration with the aid of the camera lucida was carried to the highest perfection, especially in the later volumes, and although the original plan of the work was never completed, its influence in stimulating interest in the national monuments of France, especially those of the Middle Ages, can hardly be overestimated. Baron Taylor also published illustrated volumes of travel in Spain and Portugal (3 vols., 1826-32); Syria, Egypt, and Palestine (3 vols., 1835); Jerusalem (1841); Switzerland and the Pyrenees (1843).

TAYLOR, JAMES KNOX (1857-). An American architect, born in Knoxville, Tenn. He studied architecture in the Massachusetts Institute of Technology (1877-79), and in architects' offices as draftsman for three years thereafter; and practiced his profession independently in St. Paul, Minn., from 1882 until 1892 and then for three years in Philadelphia. Entering the service of the supervising architect of the United States Treasury in Washington in 1895, he became senior draftsman in 1896 and from 1897 to 1912 was supervising architect. Under his incumbency the office of the supervising architect at Washington was raised to a high plane of artistic and practical efficiency, and the Federal buildings designed by that office or erected under its supervision from plans of other architects were uniformly creditable to the government. In 1912 Taylor became director of the department of architecture of the Massachusetts Institute of Technology.

TAYLOR, JAMES MONROE (1848-1916). An American educator. He was born in Brooklyn, N. Y., and graduated from the University of Rochester in 1868 and from the Rochester Theological Seminary in 1871. Between 1873 and 1886 he was pastor of Baptist churches at South Norwalk, Conn., and Providence, R. I. Thereafter until 1914 he served as professor of ethics in and president of Vassar College. In 1910-14 he was a trustee of the Carnegie Foundation for the Advancement of Teaching. The art building given to Vassar by C. M. Pratt in 1914 was named in honor of Dr. Taylor. He wrote: *Elements of Psychology* (1892); *A New World and an Old Gospel* (1901); *Before Vassar was Opened* (1914); *Vassar* (1915), with E. H. Haight.

TAYLOR, JEREMY (1613-67). An English prelate and author. He was born at Cambridge, the son of a barber, and educated at Caius College. He was ordained before he had reached

his twenty-first year, and attracted the attention of Laud, who procured him a fellowship at All Souls, Oxford. About the same time he was made chaplain to the king, and in 1638 rector of Uppingham. His first notable publication was *Episcopacy Asserted* (1642). His stand on the Church-and-King side cost him his living. For a while he accompanied the royal army, and then retired into Wales, where he opened a school at Newton in Carmarthenshire and became chaplain to the Earl of Carbery. Here he produced his most memorable works—the *Liberty of Prophesying*, on behalf of the expelled Anglican clergy, in 1647; the *Life of Christ* and the *Holy Living* in 1649; the *Holy Dying* in 1652; and a number of other devotional and controversial books. In 1660, with a dedication to Charles II, appeared his *Ductor Dubitantium, or the Rule of Conscience in All her General Measures*, the most learned, subtle, and curious of all his works. Promotion was a matter of course to one who was at once a staunch royalist, a profound theologian, and a consummate writer; and before the year was out he was made Bishop of Down and Connor. He was not happy in his Irish see, from which he prayed to be delivered as from "a place of torment." The Scotch Presbyterian ministers who had occupied the livings under the Commonwealth disputed his belief in the invalidity of their ordination, and were only ejected with difficulty. He remained at his post, however, until his death. Taylor, sometimes styled the English Chrysostom on account of his golden eloquence, has few equals for richness of fancy. His inexhaustible imagery, full of tender beauty, touched with the characteristic melancholy of the age, reminds us of Shakespeare and Spenser and Fletcher rather than of a sober theologian. His style is perhaps seen at its best in his sermons, though his *Holy Living* and *Holy Dying*, for their deep and practical piety, have been popular devotional manuals for each generation since his time. The best complete edition of his works is that by Eden in ten vols. (London, 1847-52), with a memoir by Bishop Heber. Consult also E. H. May, *Dissertation on the Life, Theology and Times of Jeremy Taylor* (London, 1892); Edward Dowden, in *Puritan and Anglican* (ib., 1900); E. V. Gosse, *Jeremy Taylor* (ib., 1904); George Worley, *Jeremy Taylor* (new ed., ib., 1907); E. A. George, in *Seventeenth Century Men of Latitude* (New York, 1908).

TAYLOR, JOHN (1580-1653). An English writer, styled by himself the "King's water poet." He was born at Gloucester. After studying there at the grammar school, he was apprenticed to a London waterman. Pressed into the navy, he served under Essex at Cadiz (1596), and, by his own statements, made many voyages in the Queen's ships. Retiring from the navy from lameness, he became a waterman on the Thames, and superintended river pageants. As trade waned, owing largely to the fashion for coaches, he began writing doggerel, which attracted attention and secured him the patronage of men of letters. On the outbreak of the Civil War (1642) he went to Oxford, where he opened a public house. Returning to London (1645), he took the Crown Tavern in Long Acre. There he died. Though hardly a poet, his work is interesting as a picture of contemporary manners. Of his separate publications, numbering about 150, may be mentioned the *Penniless Pilgrimage* (1618), an account of a

trip to Scotland; *Laugh and Be Fat* (1613); *Praise of Hempseed* (1620), an account of a voyage from London to Queensborough, in Kent, in a brown-paper boat; and *Three Weeks . . . Travel from London to Hamburgh* (1617). In 1630 Taylor brought out an edition of his writings under the title *All the Works of John Taylor, the Water Poet, being 63 in number*. This folio was reprinted by the Spenser Society (three parts, London, 1868-69). Other pamphlets not contained in the edition of 1630 were also reprinted by the same society (five parts, 1870-78). For a selection consult his *Early Prose and Poetical Works* (London, 1888).

TAYLOR, JOHN (1750-1824). An American legislator and writer, born in Virginia. He graduated at William and Mary College in 1770, and was a member of the United States Senate from 1792 until 1794, for two months in 1803, and from 1822 until his death. In 1798 he moved in the House of Delegates the "Virginia Resolutions." (See VIRGINIA AND KENTUCKY RESOLUTIONS.) He published: *An Inquiry into the Principles and Policy of the Government of the United States* (1814); *Aratos: being a Series of Agricultural Essays, Practical and Political* (6th ed., 1818); *Construction Construed and the Constitution Vindicated* (1820); *New Views of the Constitution of the United States* (1822). *Disunion Sentiment in Congress in 1794* was published in 1905. In his works he was an advocate of strict construction of the Constitution.

TAYLOR, JOHN (1808-87). The successor of Brigham Young (q.v.) as president of the Church of Jesus Christ of Latter-Day Saints. (See MORMONS.) He was born at Winthrop, England, became a Methodist local preacher, and emigrated to Canada in 1820. In 1836 he joined the Mormon church and was elected one of the Twelve Apostles. At the assassination at Carthage of Joseph Smith, Jr. (q.v.), he was himself wounded, but was one of those who counseled the Mormons to keep the peace. Opposing the claims of Sidney Rigdon (q.v.) to the headship of the church, he started with the first emigrants for the Salt Lake valley. Appointed to the European mission, he was active in Britain and France for several years and published a Mormon monthly in Paris and translated the *Book of Mormon* into French and German. Returning to America in 1852 he was stationed in New York in 1854 as superintendent over the eastern churches and there published the *Mormon*. Having served as associate justice of the inchoate State of Deseret, as a probate judge of Utah County, and a member of the Utah Legislature, in 1858 he was indicted for treason against the United States government. On Oct. 6, 1880, he was elected president of the Mormon church. He was a firm believer in polygamy, for which he was indicted in 1885, afterward fleeing to avoid criminal prosecution and living in seclusion until his death.

TAYLOR, JOHN LOUIS (1769-1829). An American jurist, born in London, England. He removed to Fayetteville, N. C., and was admitted to the bar. From 1792 to 1794 he was a member of the State Legislature, in 1798 was elected a judge of the Superior Court, and was Chief Justice of the Supreme Court from 1808 until his death. In 1817 he was appointed a commissioner for the revision of State statutes, the work being published in 1821. His publications include: *The North Carolina Law Reposi-*

tory (2 vols., 1814-16); *Term Reports* (1818); and *On the Duties of Executors and Administrators* (1825).

TAYLOR, JOSEPH (?1586-?1653). An English actor, mentioned in the Shakespeare folio of 1623 as one of those who appeared in Shakespeare's plays. His Hamlet, which he acted after Burbage, is interesting on account of the tradition that Shakespeare himself trained him in the part. At different times he was a member of the company at the Globe Theatre and elsewhere, and later in life he was appointed to the government office of Yeoman of the Revels. Consult Collier, *Memoirs of the Principal Actors in the Plays of Shakespeare* (London, 1846).

TAYLOR, LAURETTE (née COONEY) (1887-). An American actress, born in New York City. She was married to Charles A. Taylor, and later to J. Hartley Manners (q.v.). Having made her first appearance on the stage while a child, she toured and for a time played in stock at Seattle, Wash., and in 1909 appeared in New York in *The Devil*. In 1912 she achieved a great success as Luana in *The Bird of Paradise*. Miss Taylor became best known in the Irish comedy rôle of Peg in her husband's play, *Peg o' My Heart*, which ran more than 600 performances in New York in 1912-14 and later more than 500 in London. During the same period she starred in a sketch by her husband called *Happiness*.

TAYLOR, NATHANIEL WILLIAM (1786-1858). An American Congregational theologian. He was born at New Milford, Conn.; graduated at Yale College in 1807. He studied theology five years with Dr. Dwight and was ordained pastor of the First Church (Congregational), New Haven, in 1812, as successor of Moses Stuart. In 1822 he was elected Dwight professor of didactic theology in Yale College, and held the position till his death. In 1828 he preached in New Haven the *concio ad clerum*, presenting views on native depravity which were denounced as heretical, and led to the founding of what later became Hartford Theological Seminary, in opposition to his views. Dr. Taylor modified the New England theology (q.v.) in the direction of a recognition of free will. After his death, four volumes of his works were edited by President Noah Porter: *Practical Sermons* (1858); *Lectures on the Moral Government of God* (1858); *Essays, Lectures, etc., upon Select Topics in Revealed Theology* (1859). His *Life* was published at New Haven in 1858. Consult F. H. Foster, *Genetic History of New England Theology* (Chicago, 1907).

TAYLOR, PHILIP MEADOWS (1808-76). An Anglo-Indian officer and novelist. He was born in Liverpool, England, and when 15 years old went to India to enter commercial life in Bombay, but instead received a commission in the Nizam of Hyderabad's army. In 1841 he was commissioned to pacify the State of Shorapore and was appointed administrator during the minority of the ruler, satisfying in this both the natives and the British government. After the Raja's accession he was appointed administrator of the ceded districts in the Western Deccan, his rule during the perilous time of the Mutiny being eminently successful. He returned to England in 1860 and in 1869 was made a Companion of the Star of India. Besides his brilliant administrative services Taylor was widely known by his popular novels illustrative of stirring periods in the history of India; the chief of

them are: *The Confessions of a Thug* (1839); *Tippoo Suttaun, a Tale of the Mysore War* (1840); *Tara, a Mahratta Tale* (1863); *Seeta* (1872); and *A Noble Queen* (1878), the last two descriptive of the Indian Mutiny. Consult his autobiographical *Story of My Life* (London, 1877).

TAYLOR, RICHARD (1826-79). A Confederate soldier, familiarly known as "Dick" Taylor. He was the son of President Zachary Taylor, and was born at New Orleans. He graduated at Yale in 1845, and was for a time with his father in the Mexican War. He was a member of the Louisiana seceding convention, and later became colonel of the Ninth Louisiana Regiment. He was soon promoted to the rank of brigadier general; fought under Stonewall Jackson in the Shenandoah valley campaign, and then in the Seven Days' Battles before Richmond; was promoted to the rank of major general, and was put in command of Louisiana, the western part of which he recovered for the Confederacy. On April 8, 1864, he defeated General Banks at Sabine Cross Roads, and captured 22 guns and about 2500 prisoners, thereby making it necessary for the Federal general to give up the Red River expedition and to retreat. On the following day, however, Taylor himself sustained a severe repulse at Pleasant Hill. On May 4, 1865, he surrendered to General Canby. He published *Destruction and Reconstruction* (1879).

TAYLOR, ROBERT WILLIAM (1842-1908). An American physician. He was born at Coventry, England, but as a child came with his parents to New York. He was early a druggist, studying medicine during leisure and graduating from the College of Physicians and Surgeons in 1868. He then commenced practice in New York City and turned his attention to dermatology and venereal diseases, a field in which he soon became a leading surgeon. From 1891 to 1905 he held the chair of genitourinary and venereal diseases in the College of Physicians and Surgeons. He published various important papers and books on his specialty.

TAYLOR, ROWLAND (?-1555). An English martyr. He was born at Rothbury, Northumberland, and was educated at Cambridge, where he became principal of Borden Hastel about 1531. He was associated with Cranmer as domestic chaplain, and received in succession numerous ecclesiastical appointments. At Cambridge he had become acquainted with the Protestant manual *Unio Dissidentium* and was a firm believer in, and adherent to, its doctrines. As rector of the living of Hadleigh, Suffolk, to which he had been presented by Cranmer in 1544, he opposed the performance of mass by a priest in 1554, was imprisoned by order of Queen Mary, condemned to death, and on Feb. 9, 1555, was burnt on Aldham Common, near Hadleigh.

TAYLOR, SAMUEL COLERIDGE. See COLERIDGE-TAYLOR, SAMUEL.

TAYLOR, THOMAS (1758-1835). An English classical scholar known as "the Platonist." He was born of humble parents in London. He studied at St. Paul's School, taught school, and at length obtained a clerkship in a London bank. His spare time he gave to the study of chemistry, mathematics, and especially Greek philosophy; and soon after 1780 he began his lectures on Plato, Plotinus, and the Neo-Platonists. On receiving an annuity of £100 from a friend, he resigned his place in the bank and began

translating and expounding the ancient classical authors, a work for which he was ill equipped. Among his translations are: *Plato* (1804); *Aristotle* (1806-12); *The Mystical . . . Hymns of Orpheus* (1787); *Apuleius; Celsus; Iamblicus; Julian; Maximus Tyrius; Pausanias; Plotinus; Porphyry; and Proclus*. Among his miscellanies are: *Indication of the Rights of Brutes* (1792); *The Eleusinian and Bacchic Mysteries* (1790); and *Theoretic Arithmetic* (1816). Taylor enjoyed the friendship of Peacock, Romney, and Langton. He died at Walworth, London. He figures as a character in Isaac D'Israeli's novel *Vaurien*. Consult W. E. A. Axon, *Thomas Taylor, the Platonist* (London, 1890).

TAYLOR, SIR THOMAS WARDLAW (1833-). A Canadian lawyer and judge, born in Auchtermuchty, Scotland. He studied at Edinburgh University, and was admitted to the Upper Canadian bar in 1858. From 1872 to 1883 he was Master of Chancery, and from 1883 to 1887 puisne judge of the Manitoba Court of Queen's Bench. In 1887-99 he was Chief Justice of Manitoba, and in 1890 and 1893 was administrator of the provincial government. He made an extensive study of equity jurisprudence, on which subject he published a volume of *Commentaries* (1875). His further works include *Chancery Statutes and Orders* and *The Public Statutes Relating to the Presbyterian Church*.

TAYLOR, TOM (THOMAS PROCLUS) (1817-80). An English playwright and journalist, and editor of *Punch*, born at Bishop-Wearmouth, near Sunderland. After attending the University of Glasgow he entered Trinity College, Cambridge, where he was elected fellow of his college (1842). He tutored at Cambridge for two years and was then (1845) appointed professor of English literature in London University. He also studied law at the Inner Temple, where he was called to the bar in 1846. On the creation of the Board of Health in 1850, he became its assistant secretary and afterward its secretary. He began early to write for various London periodicals, but chiefly for *Punch*, of which he became editor in 1874. Much interested in art, he wrote biographies of Benjamin Robert Haydon (1853) and of Sir Joshua Reynolds (1865), and edited *Charles Robert Leslie's Autobiographical Recollections* (1860) and *Pen Sketches by a Vanished Hand* (1879), a collection of essays by Mortimer Collins. He also wrote or adapted more than a hundred dramatic pieces. In them he showed himself a great master of stagecraft. Among the most popular were: *Still Waters Run Deep* (1855); *The Overland Route* (1860); *Twist Awe and Crown* (1870); *The Ticket-of-Leave Man* (1863); and *Lady Clancarty* (1874). In *Masks and Faces* (performed in 1852) he collaborated with Charles Reade.

TAYLOR, WILLIAM (1765-1836). An English philologist, known sometimes as William Taylor of Norwich. He was born in Norwich, England. He became an enthusiast for the literature of Germany, and devoted most of his life to making it known to his countrymen. His finest production was a translation of Bürger's *Lenora* in ballad metre (completed 1790; published 1796), which led to Scott's version. He also translated Lessing's *Nathan the Wise* (1790; printed, 1805), Goethe's *Iphigenia* (1793), and some of Wieland's *Dialogues of the Gods* (1795). By this time he was writing on German literature extensively for the reviews.

These articles were collected under the title *Historic Survey of German Poetry* (3 vols., 1828-30). Though interesting for his many eccentricities, Taylor has a place in literary history as the first interpreter of German literature for England. He died at Norwich. Consult the *Memoir* by Robberds (London, 1843) and Herzfeld's valuable monograph, *William Taylor von Norwich* (Halle, 1897).

TAYLOR, WILLIAM (1821-1902). An American Methodist Episcopal missionary bishop. He was born in Rockbridge, Va., and entered the Baltimore conference in 1843. A missionary to California in 1849, he organized the first Methodist church in San Francisco. Between 1856 and 1883 he traveled in many parts of the world as an evangelist. He was elected Missionary Bishop of Africa in 1884, and retired in 1896. He wrote: *Seven Years' Street Preaching in San Francisco* (1857); *Christian Adventures in South Africa* (1867); *Four Years' Campaign in India* (1875); *Our South American Cousins* (1878); *Self-Supporting Missions in India* (1882); *The Story of My Life* (1895); *Flaming Torch in Darkest Africa* (1898).

TAYLOR, WILLIAM LADD (1854-). An American illustrator, born at Grafton, Mass. He studied art in Boston and New York, and in Paris under Boulanger and Lefebvre in 1884-85. His drawings, many of which first appeared in magazines, are essentially narrative in type and show keen understanding of human nature, with careful, historical accuracy. Taylor published several volumes of his work, series illustrating the nineteenth century in New England, the pioneer West, Longfellow, the Psalms, old songs, American life, American literature, the Old Testament.

TAYLOR, WILLIAM MACKERGO (1829-95). An American Congregational minister. He was born at Kilmarnock, Ayrshire, Scotland, and graduated at the University of Glasgow (1849), and at the divinity hall of the United Presbyterian Church, Edinburgh (1852). He was pastor of churches in Britain till 1872 (for 17 years of one in Liverpool) and thereafter of the Broadway Tabernacle (Congregational), New York, till 1893, when he retired in consequence of a paralytic stroke. Besides biographies of Rev. Matthew Dickie (1872) and of John Knox (1885), he published numerous volumes of sermons and discourses, of which those of a biographical character on Joseph, Moses, David, Elijah, Daniel, Paul were very popular. He was editor of *The Christian at Work* (1876-80). He delivered the Lyman Beecher lectures at Yale in 1876, *The Ministry of the Word*; the L. P. Stone lectures at Princeton, *The Gospel Miracles in their Relation to Christ and Christianity* (1880); also published *The Scottish Pulpit from the Reformation to the Present Day* (1887). A brief memoir appeared in New York in 1895.

TAYLOR, ZACHARY (1784-1850). The twelfth President of the United States. He was born in Orange Co., Va., on Nov. 24, 1784, and was the son of Col. Richard Taylor, an officer of the Revolutionary War and one of the first settlers of Louisville, Ky., whither Zachary was taken in early childhood, and where he lived until his twenty-fourth year, working on a plantation and receiving only an elementary education. His elder brother, who had received a lieutenancy in the army, died in 1808, when Taylor was appointed to the vacant commission. In 1810 he was promoted to a captaincy; and in

1812, with 50 men, two-thirds of whom were ill of fever, he defended Fort Harrison, on the Wabash, against a large force of Indians led by Tecumseh. Promoted to the rank of major for his gallantry, he was employed during the war in fighting the Indian allies of Great Britain. In 1822 he built Fort Jesup. With headquarters at Fort Crawford, Prairie du Chien, Wis., from 1832 to 1836, Taylor served as colonel in the Black Hawk War and later as Indian agent at Prairie du Chien. In 1836 he was ordered to Florida, where he gained an important victory over the Seminole Indians at Okeechobee, for which he was appointed brigadier general, and was made commander of the United States forces in Florida. In 1840, having been appointed to the command of the Southwestern Department, he purchased a plantation near Baton Rouge, La. On Feb. 28, 1845, Congress passed the resolution for the annexation of Texas, formerly a province of Mexico, and for some time an independent republic. Texas claimed the Rio Grande for her southwestern boundary; Mexico insisted that there could be no claim beyond the Nueces, and prepared to defend the disputed territory, even if she could not reconquer the whole of Texas. General Taylor was ordered to Corpus Christi. This point he occupied in November with a small force which was increased by reinforcements to 4000 men. On March 28, 1846, he had moved to the Rio Grande, across the disputed territory, and had begun to build Fort Brown, opposite and commanding the Mexican port of Matamoros. General Ampudia, the Mexican commander, on April 12, demanded that he should retire beyond the Nueces, pending negotiations; and on the refusal of General Taylor, his successor, General Arista, crossed the Rio Grande with a force of 6000 men and 10 pieces of artillery. On May 8 he was defeated at Palo Alto by General Taylor, with a force of 2300; and on the next day was driven from a new position at Resaca de la Palma across the Rio Grande. War was declared first by the President, and later by Congress, to exist by the act of Mexico; and 50,000 volunteers were called for. Taylor was made major general, was reinforced, and ordered to invade Mexico. On September 9, with 6600 men, he attacked Monterey, which was defended by about 10,000 regular troops. After ten days' siege and three days' hard fighting it capitulated. General Scott, having been ordered to advance on the city of Mexico by Vera Cruz, withdrew a portion of the troops of General Taylor, leaving him only 5000 volunteers and 500 regulars, chiefly flying artillery, to meet an army of 20,000, commanded by Santa Anna. He took a strong position at Buena Vista, fought a desperate battle on Feb. 22 and 23, 1847, and won a decisive victory. (See MEXICAN WAR.) This victory, against enormous odds, created the utmost enthusiasm. General Taylor, popularly called "Old Rough and Ready," was nominated by the Whigs in 1848 for President of the United States, and was elected, receiving 163 electoral votes, while General Cass, the Democratic candidate, received 127 electoral votes, and Martin Van Buren, the Free Soil candidate, received none. Entering upon the presidency in 1849, he found a Democratic plurality in Congress, with a small but vigorous Free Soil party holding the balance of power, while the most exciting questions connected with the extension of slavery, as the admission of California, the settlement

of the boundaries of Texas, the organization of the other newly acquired Mexican territories, etc., were agitating the country and threatening a disruption. On July 4, 1850, 16 months after his inauguration, he was attacked with bilious colic and died on the 9th. Consult: H. O. Ladd, *The War with Mexico* (New York, 1883); O. T. Howard, *General Taylor* (ib., 1892); J. F. Rhodes, *History of the United States* (ib., 1910); J. G. Wilson, editor, *Presidents of the United States, 1789-1914*, vol. ii (ib., 1914).

TAYLORVILLE. A city and county seat of Christian Co., Ill., 26 miles southeast of Springfield, on the Wabash, the Chicago and Illinois Midland, and the Baltimore and Ohio Southwestern railroads (Map: Illinois, F 6). It has a Carnegie library, St. Vincent Hospital (Roman Catholic), and a fine courthouse. Taylorville is surrounded by a productive region engaged in farming, stock raising, and horse breeding, and has two large coal mines and an iron foundry. Paper, chemicals, brick, tile, wagons, bags, and agricultural implements constitute the principal manufactures. Pop., 1900, 4248; 1910, 5446.

TAYRA, or **TAIRA**, tí'rà (South American name). A plantigrade, weasel-like carnivore of Central and South America (*Galictis barbara*), closely allied to the grisons (q.v.). It is about three feet long, nearly half of this belonging to the bushy tail; dark brown above, yellowish below; preys upon small animals, and often gathers into small bands which hunt in company, usually in the early morning.

TAYTAY, tí-tí'. A pueblo and the chief town of the Province of Paragua, Palawan Island, in the Philippines; situated in the southwest angle of the bay of the same name in the northeast part of the island. The Bay of Taytay is about 11 miles long and 6 miles wide, and affords good shelter in the southwest monsoon. There is a fort with walls 30 feet high and accommodations for 700 men. In the neighborhood of the town are large tracts of cultivated ground. Pop., 1903, 4992.

TA YÜ. See YÜ.

TAYUG, tá-yoög'. A town of Luzon, Philippines, in the eastern part of the Province of Pangasinán, situated 28 miles east of Lingayén. Pop., 1903, 10,400.

TAZE'WELL, LITTLETON WALLER (1774-1860). An American political leader, born at Williamsburg, Va. He graduated at William and Mary College in 1792; was admitted to the bar in 1796; was a member of Congress in 1801-03; and then devoted himself to the practice of law. From 1824 until 1833 he was a member of the United States Senate. As a member of the Committee on Foreign Relations he wrote the famous report on the Panama mission. He opposed most of the acts of Adams and of Jackson; was an enemy to the policy of protection; denounced nullification, but was not in sympathy with Jackson's method of suppressing it; and attacked the administration for removing the United States Bank deposits. In 1834 he was elected Governor of Virginia, and after one term withdrew from public life. His principal published work is *Review of the Negotiations between the United States and Great Britain Respecting the Commerce of the Two Countries* (1829).

TCHAADAEV, chä-dä'yöf, PETR (PIOTR) YAKOVLEVITCH (1794-1856). A Russian writer, born at Moscow. On graduation from Moscow

University (1812) he entered the army and served in the Napoleonic wars. The main thesis of his famous *Philosophical Letters*, the first of which appeared in 1830 in the *Moscow Telescope*, was that Russia had lagged behind Western countries and had contributed nothing to the world's progress. He therefore concluded that Russia must start de novo. These strikingly uncomplimentary views caused their author to be adjudged insane, and his next work was entitled, fittingly, *The Vindication of a Madman* (1837). In this brilliant but uncompleted work he maintained that Russia must follow her inner lines of development if she was to be true to her historical mission. The Slavophiles at first mistook Tchaadaev for one of them, but later, on realizing their mistake, bitterly denounced and disclaimed him. Tchaadaev really fought Slavophilism all his life. Most of his works have been edited by his biographer, M. Gershenzon (2 vols., Moscow, 1913-14), whose excellent little study of the philosopher was published at St. Petersburg in 1908.

TCHAD. A lake of Central Africa. See CHAD.

TCHAIKOVSKY, chī-kōf'skī, NIKOLAI VASILEVITCH (1850-). A famous Russian revolutionist. He was born in the Province of Saratov and studied natural science, especially chemistry, at St. Petersburg University. Subsequently he interested himself in the labor movement and became a prominent revolutionary leader. To study the labor question in its international aspects he traveled much abroad. While in the United States he founded a commune, which, however, was short lived: After the revolutionary events of 1905-06, Tchaikovsky returned to Russia and subsequently resided in London.

TCHAIKOVSKY, PETER IL'YITCH (1840-93). The greatest composer Russia has thus far produced, born at a small place called Votkinsk, in the Ural mining region, on May 7, 1840. He studied jurisprudence in St. Petersburg, and in 1859 obtained a position in the Ministry of Justice. In company with a young poet named Apukhtin, who greatly influenced his future, he listened to Italian opera whenever an opportunity presented itself. This love of Italian music left its traces in Tchaikovsky's scores. He entered the conservatory, where Anton Rubinstein, its director, was attracted by the young man's ability. Tchaikovsky resigned his government position, studied music with all the vigor of his nature, and, on his leaving the conservatory three years later, he continued to study orchestration with Rubinstein and took up the flute, piano, and organ. In 1866 he accepted the position of teacher of harmony at the Moscow Conservatory. It was at this time that he met the poet Ostrovsky, who gave him the libretto for his first opera, *Voyevoda* (The Chieftain).

Tchaikovsky's first musical idols were Glinka, the father of modern Russian music, and Mozart. He venerated Beethoven and admired Schumann, but, singularly enough, he never cared much for Chopin. Schumann, with his short-breathed phrases, was the Russian's model in writing for the pianoforte. Tchaikovsky went on composing, undeterred by the lack of appreciation on the part of both the Rubinsteins. Even the brilliant and effective first piano concerto was picked to pieces by Nicholas, and so hurt was the young composer that he erased the dedication to Nicholas and substituted the name of Hans von Bulow,

who rewarded the courtesy by producing the concerto in Boston on the occasion of his first visit to America (1875-76). Tchaikovsky made the acquaintance of Balakireff, who urged him to compose the *Roméo et Juliette* fantasia overture. Now flowed forth a stream of songs, symphonic poems, concertos, symphonies, operas, chamber music, overtures, dances, many experimental in form, much that was mediocre and also some genuine masterpieces. An unhappy marriage, briefly endured, sent him into a retirement at Klin, which was occasionally interrupted by trips to Germany, France, Italy, Switzerland, and England. He met Brahms and liked the man, but never concealed an antipathy for his music. He admired Wagner, with many reservations, though he willingly visited Bayreuth. But he took no great interest in the music drama, preferring old-fashioned operatic forms. All his opinions, musical and otherwise, may be found in his *Diary*, and in his musical criticisms, which were edited by G. A. Laroche. His fame grew apace, and in the spring of 1891 he visited America, in response to the invitation of Walter Damrosch, and was present at the dedication of Carnegie Hall, New York. On Nov. 6, 1893, Tchaikovsky died in St. Petersburg, after a short illness, of cholera. His death evoked universal sympathy, and Russia learned from the western world that she had lost her greatest composer.

For many years the opposition to Tchaikovsky was based upon the allegation that he was not really one of the Neo-Russian nationalists, who with Tolstoy "went to the people" for their themes. Tchaikovsky, like Turgenev, was a traveled man of culture, and a cosmopolitan on certain sides of his art; but there was no truer patriot than this fiery-souled poet, who demonstrated his slavophilism in a hundred of his compositions. His happiest work is in the pure fantasy, or what he was pleased to term "overture fantasia." Thus his *Manfred*, *Roméo et Juliette*, *The Tempest*, and *Francesca da Rimini* give us Tchaikovsky at the very height of his powers. The unfailling invention which marks his poetic works seemed to desert him when he attempted absolute music. A poet first, musician afterward, Tchaikovsky was inspired by a definite programme. He was a born master of orchestration. The *timbres* of his instruments meant for him so many voices, and so his works are often tone dramas, operas without words. Tchaikovsky's music reveals the mighty pessimism of his nation. His symphonies are often built upon typical phrases, taken from the folk song; he is Russian in his operas, with their national texts and treatment. Some of his songs—he wrote over a hundred—are masterpieces. His Florentine string sextet is warm in color, and in his three string quartets he often strays across the borders into the pleasing country of the operatic. The world has come to recognize the last movement of the *Pathetic* symphony as an unparalleled embodiment of woe. The fifth symphony is more homogeneous; the fourth, in F minor, more Russian. There are three piano concertos, a violin concerto, and many exquisite piano pieces. The three great symphonies (4, 5, 6), the symphonic overtures, with their wealth of musical imagery, their dramatic power and thrilling effects, constitute Tchaikovsky's claim to immortality. He had a predilection for ballet music and left charming specimens of dance music in *Le cassenoisette* suite and other composi-

tions in a light vein. His operas are seldom heard outside of Russia. *Pique Dame* (1890), immensely popular in Russia, is the only one of Tchaikovsky's ten operas ever produced in the United States (Metropolitan Opera House, 1910), and failed to impress. *Eugene Onegin* (1879), no less popular in Russia than the just-mentioned opera, had two complete performances in America in concert form (New York, 1908, 1911), but its reception was not such as to warrant the expense of scenic production. Besides these, the *Voyevoda* (1869), *The Maid of Orleans* (1881), *Mazeppa* (1882), and *Iolanthe* (1893) met with success in Russia. Other noteworthy works include the incidental music to the lyric drama *Snowdrop*; three ballets, *Le lac des cygnes*; *La belle au bois dormant* (1890); and *Le cassenoisette*; symphonies, and a great mass of miscellaneous compositions. He published a *Treatise on Harmony* (1872); a translation of Gevaert's *Traité d'instrumentation* (1866); and also wrote *Musikalische Erinnerungen und Feuilletons* (1899). A complete thematic catalogue of the composer's works was published by P. Jurgenson at Moscow (1897).

Consult: Iwan Knorr, *Tschaikovsky* (Berlin, 1900); E. M. Lee, *Tchaikovsky* (London, 1904); Modest Tchaikovsky, *Das Leben Peter Ilyitch Tchaikovsky's*, translated from the Russian by Paul Juon (2 vols., Leipzig, 1900-04); the same translated and abridged by Rosa Newmarch as *The Life and Letters of Peter Ilyitch Tchaikovsky* (London, 1905); E. Evans, *Tchaikovsky* (ib., 1906); Rosa Newmarch, *Tchaikovsky, his Life and Works* (ib., 1908).

TCHAKA. See ZULULAND.

TCHERKHOV, ANTON PAVLOVITCH. See CHERKHOV.

TCHELIABINSK, chél-yá-bínsk'. An important district town in the Government of Orenburg, east Russia, 363 miles northeast of Orenburg (Map: Russia, K 3). As the western terminus of the Trans-Siberian Railway the town has considerable commercial importance. On its outskirts are special barracks for Siberian emigrants, of whom 267,000 passed in 1913. Pop., 1910, 70,472.

TCHELYUSKIN, chél-yūs'kin, CAPE. See SEVERO CAPE.

TCHENSTOCHOW. See CHIENSTOCHOW.

TCHER-EMIS'SES. A Finnish tribe of eastern Russia, living in the region on the left bank of the middle Volga—Vyatka, Kazan, and the adjoining governments. They number about 375,000. Their average height is 1.61 meters, the cephalic index 79. In general, they have red hair and a full beard of the same color; their eyes are sunken and of blue, greenish, or chestnut shade; the complexion is fair and freckled, the cheek bones prominent, the face and lips thin, the chin round, and the nose straight. Some authorities believe that they received through the Bulgarians the Tatar influences displayed in their social life, their houses, costumes, social organization, and religious ideas. They believe in evil and good gods, and in spirits of the dead which they worship with peculiar rites. They have also many magical rites to ward off the evil influences of the spirits of the wood, river, and snow and to keep the ghosts of the dead in their graves. Consult Smirnov, *Mordves et Tcheremisses* (Paris, 1895).

TCHERKASK. Novo-. See NOVO-TCHERKASK.

TCHERKASSY, chér-kás'sé. A district town

in the Government of Kiev, South Russia, situated on the Dnieper, 126 miles southeast of Kiev (Map: Russia, D 5). It trades in grain, tobacco, and sugar. Pop., 1910, 39,649.

TCHERKESSES. See CIRCASSIANS.

TCHERNAYA, chër-ná'yá. A small river in the Crimea, Government of Taurida, South Russia, flowing into the Black Sea near Sebastopol. On Aug. 16, 1855, a Russian army advancing to the relief of Sebastopol was defeated by the allies with heavy loss on the banks of the Tchernaya.

TCHERNAYEV, chër-ná'yěf, MIKHAIL GRIGORIEVITCH (1828-98). A Russian general. He entered the army in 1847, fought in the Crimean War and in the Caucasus and went to Turkestan in 1864 as major general and captured Tashkent. He had made an unsuccessful attempt on this town the year before. He left the army in 1867, commenced the practice of law at Moscow, and became an ardent advocate of Pan-slavism (q.v.). In 1876 he received the command of the Servian army on the Morava, and was defeated by the Turks at Alexinatz, October 29. In 1879 he tried to organize a revolution in Bulgaria and was sent as prisoner to Adrianople and thence brought to Russia. From 1882 to 1884 he was Governor-General of the Military Department of Tashkent in Turkestan.

TCHERNIGOV, chër-ně'góf. A government in southwest Russia. Area, 20,233 square miles (Map: Russia, D 4). The surface is level, and in the north marshy. It is watered by the Dnieper and the Desna. The chief occupation is agriculture and the principal products are rye, buckwheat, potatoes, wheat, and tobacco. Stock raising is also important. There is an abundance of porcelain clay, which is used extensively for the production of porcelain ware; woodenware is also largely manufactured. There are a number of sugar refineries and distilleries. Pop., 1912, 3,083,500, consisting largely of Little Russians. Capital, Tchernigov (q.v.).

TCHERNIGOV. The capital of the government of the same name, in Russia, situated on the Desna, 476 miles southwest of Moscow (Map: Russia, D 4). Almost all the trade and commerce of the government is concentrated in this city. It has two cathedrals, dating from the eleventh and the twelfth centuries, and remains of an old castle. Pop., 1910, 32,848. Tchernigov rose to political and commercial importance as early as the eleventh century, but, falling into the path of the Tatar invasion, it lost much of its prominence.

TCHERNYSHEV, chër'ní-shěf, ALEXANDER IVANOVITCH, PRINCE. See CHERNYSHEV.

TCHERNYSHEV, THEODOSEI NIKOLAIEVITCH (1856-1914). A Russian geologist. After his studies at a naval academy and a school of mines, he made a geological map of the western slope of the Ural Mountains. By 1903 he had become director of the Russian Geological Committee, many of whose annual expeditions to the Urals he superintended. Later he was placed in command of an expedition to northern Russia, made geological studies of the Donetz basin, explored Nova Zembla, and headed an expedition to determine the meridian line of Spitzbergen. Most of Tchernyshev's published work, including several monographs which brought him the highest prizes from scientific societies, is embodied in the proceedings of those societies.

TCHERNYSHEVSKY, NIKOLAI GAVRILOVITCH. See CHERNYSHEVSKY.

TCHERTKOV, chěrt'kóf, VLADIMIR (1854-). A Russian writer, born in Moscow. He was an officer in the Russian Imperial Life Guards in 1874-81; was a magistrate in South Russia; and organized schools and self-help among the peasants. Tchertkov founded a publishing enterprise called Posrednik for distributing the best literature among the people; circulated private editions of Tolstoy's works; and disseminated information about the government's persecution of the Sectarians. For publishing an appeal in behalf of the Doukhobor sect, which was then being exterminated by the government, he was exiled in 1897, and thereafter lived in England, where he became editor of the Free Age Press publications. He published *Christian Martyrdom in Russia* (1897; 2d ed., 1900) and *A Short Biography of William Lloyd Garrison* (1904), with Florence Holah.

TCHETCHEN, or **CHECHEN**. One of the eastern groups of the peoples of the Caucasus, dwelling between the Kabards and Lesghians (cephalic index, 84.5). They number some 300,000 and comprise the Tchetchens proper, Ingushes, Itchkerians, and Kists (q.v.). They call themselves Nakhtche, or "people." They are one of the most primitive peoples of the Caucasus, and in their mountain fastnesses even now resist Russian conquest. Their religion seems to be Islamism imposed upon an earlier crude form of Christianity with a heathen background. By language they rank as an independent stock.

TCHIAM. See INDO-CHINESE.

TCHICHAGOV, PAVEL VASSILIEVITCH. See CHICHAGOV.

TCHIGORIN, chig'ô-rin, MICHAEL (1850-1908). A Russian chess master, born in St. Petersburg. He was engaged for a time in the Russian civil service, but early became interested in chess, and at the Berlin tournament of 1881 increased his local fame as an expert by following Blackburn and Zukertort in the list of victors. He was defeated by Steinitz at Havana in 1889, although two years afterward he won two cable matches. In 1892 he made an unsuccessful attempt to win the world's championship. At the Moscow tournament of 1899 he won first prize, divided the first honors in 1900 at the National Russian Tournament, and was third in the International Masters' Tournament held at Monte Carlo in 1901, and first in the Masters' Tournament at St. Petersburg in 1904.

TCHIKHACHEV, PETER ALEXANDROVITCH. See CHIKHACHEV.

TCHING-PAO. See NEWSPAPER.

TCHIRIKOV, chě'rě-kóf, YEVGENY (1864-). A popular Russian writer, born in the Province of Simbirsk. His reputation dates from 1893, when he began to write for prominent monthlies. Thereafter he was a prolific writer of stories, sketches, plays, and novels. His noteworthy fiction includes *The Foreigners*, *The Invalids*, *Faust*, *The Rebels*, *In the Folds of Passion*, and *The Life of Turkhanov* (3 vols., 1914). His plays, popular in Russia, include *For Fame*, *Ivan Mironyitch*, *Congenial Friends*, *The Peasants*, *Maria Ivanovna*, and *The Jews*. Tchirikov's special field is the sombre life of the provinces. As a realist he belongs to the school of Kuprin and Korolenko.

TCHIRPAN. See CIRPAN.

TCHIRSK, NIZHNI. See NIZHNI-TCHIRSK.

TCHISTOPOL, chěs-tô'pól. A district town

in the Government of Kazan, Russia, situated on the Kama, 90 miles southeast of Kazan (Map: Russia, H 3). It has flour mills, distilleries, and cotton mills, and is the chief grain port on the river Kama. Pop., 1910, 24,921.

TCHISTOPOL. A district in the Government of Kazan, east Russia (Map: Russia, H 3). Its area is 3592 square miles. The principal industries are the raising of cereals, flax, and hemp, and the curing and manufacture of leather. Pop., 1912, 387,500.

TCHITA, chē'tā. The capital of the Territory of Transbaikalia and an important centre of east Siberia, on the Tchita River and the Trans-Siberian Railway, 532 miles by rail east of Irkutsk (Map: Asia, N 3). Pop., 1897, 11,480, largely Buriats.

TCHORLU, chōr'lōō. A town of the Vilayet of Rodosto, in European Turkey, on the Tchörü River, a tributary of the Ergene, 20 miles north-east of Rodosto (Map: Balkan Peninsula, F 4). There are Christian churches and mosques. Wine and fruit are produced; native carpets and woolen cloth are manufactured. Pop., about 11,500. Tchörü was the scene in November, 1912, of a Bulgarian victory over the Turks in the Balkan War (q.v.).

TCHUKTCHI, chōōk'chē, or **CHUKCHI** (from *chōwtcy*, rich in reindeer). A people living in the extreme northeast of Asia, numbering some 15,000. The reindeer Tchuktchi dwell in the interior about the Kolyma River; the sea (or fishing) Tchuktchi, who form the great majority, inhabit the coast of the Arctic from Bear Island to East Cape, while on the Pacific side they have mingled with the Eskimo. They are tall, well built, rather light-skinned, decidedly brachycephalic in part (there seem to be two physical varieties among them), and differ somewhat in form and features from the typical Mongolians, with whom they are allied by speech. Besides an interesting Shamanism, the Tchuktchi have a wealth of folklore and mythology not without traces of Eskimo influence. The old men commit suicide with great ceremony. See Borgoras, *The Chukchee* (Leyden, 1904). See GILLAKS.

TCHUST, chōōst. A town in the Territory of Ferghana, Russian Turkestan, 110 miles north-east of Khokand (Map: Persia, O 2). The natives manufacture knives and saddles. Pop., 1897, 13,686.

TCHUVASHES, chōō-vāsh'ēz. A people of eastern Russia, probably of Finnic (Tcheremissian) origin, and now with a strong Tatar admixture. Their seat is near the Volga and they number some 850,000. Their language, which is distinct, is assigned to the Ural-Altaic (q.v.) stock. They are industrious and orderly, their chief occupations being agriculture and cattle breeding. The Tchuvashees are nominally Christians, but more primitive Shamanistic beliefs and practices are still prevalent among them. Consult Schott, *De Lingua Tschuwasschorum* (Berlin, 1841).

TEA (from Fuhkien Chin. *te*, Chin. *ts'a*, *ch'a*, tea). *Thea sinensis* (Camellia *Thea*) is a small tree, reaching a height of about 30 feet in the tropical parts of Assam, where it is probably native. The young leaves when properly handled become the tea of commerce. In order to increase the leaf production under cultivation, the plant is pruned to the form of a much branching shrub, from 2 to 5 feet high. Propagation is usually from seed sown in the fall

in especially prepared shaded seed beds. In from one to two years the seedlings are large enough to transfer to the field. About three years after planting, the tea bush is large enough to give a small yield, which increases until the full crop is obtained after a period of from five to ten years from the seed. The

TEA (*Thea sinensis*).

garden when established yields tea for 50 years or more. When the yield falls, more or less severe pruning is resorted to. This also keeps the leaves within easy reach of the pickers. Tea has been cultivated in China and Japan since the dawn of history and in India and Ceylon since 1865. It requires a heavy rainfall, thriving best in a rainfall of 90-200 inches. In dry climates the "flushes" do not occur often enough.

Although the tea plant is an evergreen, its leaves are used for tea only during "flushes" in which active growth takes place. Leaves are picked from 10 to 25 times a year in Formosa or every 10 or 12 days in Ceylon. Only the tip of the shoot or one or two of the youngest leaves are taken. A few older and coarser leaves go into the cheaper grades of tea. The tender upper leaves and terminal buds are picked by hand, according to one of several systems of plucking, and subjected to a complicated series of processes before the tea of commerce is produced. Formerly nearly all the work of manufacturing tea was done by hand, but in more recent times the use of machinery has greatly increased, saving personal contact and reducing expense.

The difference between green and black tea is largely due to the method of manufacture, although the leaves of some varieties of tea lend themselves more readily to the manufacture of black or fermented tea than others. It has been shown recently that certain oxidizing ferments, oxidases, present in the tea leaf, acting on other substances present in the fresh leaf, produce in the presence of air a series of reddish substances which alter both the taste and the appearance of the tea so as to produce the black tea of commerce. In making green tea the freshly plucked leaves are treated to a degree of heat high enough to destroy the oxidizing ferments (about 250° F.), and to give to the leaf a thoroughly limp and wilted appearance. This leaf is then rolled by hand, or in large machine rollers, holding from 50 to 150 pounds of tea

TEA

1. THE LAST PICKING.

2. DRYING THE LEAVES IN A TEA-HEATER.

at a time. The rolling gives the twisted appearance to the leaf and brings the juices to the surface. The rolled tea then goes to the firing machine where it is heated for a proper time at a heat sufficiently high to drive off the water from the leaf and develop the substances giving fragrance to the tea. This fragrance was formerly supposed to be due to volatile oils present in the tea plant, a theory which has been proved erroneous. The tea, after firing, is stored in air-tight bins or containers until it is graded and packed for shipment or storage. In making black tea the use of heat prior to the final firing process is dispensed with. The fresh leaves are spread out in drying lofts until they have been rendered flaccid by the evaporation of moisture. They are then rolled as just described and spread out on tables in cool, well ventilated rooms to oxidize. The proper reddish appearance is obtained after an exposure of two to 10 hours in the air, when the leaf is again rolled and then fired.

Some leaves are longer and larger than others and, to obtain uniformity of appearance, the tea is put through a cutting machine, after which it is sifted and graded for the market. Sometimes it is desirable to scent the tea artificially. This is done by exposing the dried tea to the fresh blossoms of *Olea fragrans*, the sweet-scented olive, or *Aglaia odorata*, used especially in scenting of Formosa oolong teas. Still other flowers are used for this purpose. In some cases it is thought necessary for commercial reasons to improve the appearance of green teas artificially. This is done by facing the teas with finely powdered talc, Prussian blue, or other coloring agents. After a period of experimentation by private parties, notably by Dr. Charles U. Shepard, and by the United States Department of Agriculture, the culture and manufacture of tea has been established on a small scale in South Carolina. An excellent grade of tea of black, green, oolong, and other sorts, has been manufactured, and finds a ready market in the United States. New and improved machinery has been invented, and the ability of negro children to pick tea efficiently has been demonstrated. There is so much hand labor involved in picking the leaves, however, that it remains quite doubtful whether the Southern States can compete with Ceylon, Japan, and China in growing tea.

The largest importation of tea into the United States comes from Japan, including Formosa, China taking second place, India and Ceylon third. Japan and Formosa teas find their largest market in the United States. England and Russia are large consumers of black teas, the former country getting its supply chiefly from India and Ceylon, the latter from China. Some tea is grown by Russia in the Caucasus region. The total annual tea exports from the tea-producing countries are about 810,000,000 pounds. Ceylon alone has 400,000 acres of tea and exports 190,000,000 pounds annually. The tendency among tea consumers is decidedly towards the use of black tea. British India and Ceylon produce black teas almost exclusively. Some of the sorts of tea used in the United States are here enumerated: CHINESE—Greens: Gunpowder sorts, Hyson sorts, Young Hyson sorts. Blacks: Congous, red leaf from south China and black leaf from north China, as well as Canton, Pekoe, and other sorts. Oologns: including Amoy, Foochow, and other

sorts. Scented teas of various sorts in limited amount. INDIAN (including Ceylon and Java)—Greens: colored sorts: Gunpowder, Imperial, Young Hyson, Hyson, etc. Uncolored sorts: Young Hyson, Hyson. Blacks: Pekoes, of various sorts and grades, Soucheongs, and Congous. JAPAN AND FORMOSA—Greens: By various methods of firing, as pan fired, basket fired, sun dried, etc. Oologns: From Formosa, according to districts and treatment, also scented pu-chongs in small amount. See TEA INSECTS.

TEACH, or THATCH, EDWARD (?-1718). An Anglo-American pirate, popularly known as Blackbeard. He became widely known and feared for his robberies and atrocities throughout the West Indies and along the coast of Carolina and Virginia. At Pasquotank, N. C., in 1718, he was attacked by two small sloops under the command of Lieutenant Maynard of the British navy, and by a successful ruse led to board the vessels, when he with several of his men was killed. Consult C. Johnson, *Lives of the Pirates* (1724), and S. A. Ashe, "Our Own Pirates," in *The North Carolina Booklet*, vol. ii, no. 2 (Raleigh, 1902).

TEACHERS COLLEGE. An institution in New York City for the training of teachers and school administrators, and for study and research in the field of education, founded in 1888, and made a part of the educational system of Columbia University (q.v.) in 1898. The college is an integral part of Columbia University and is represented by its dean and faculty delegates, but maintains its separate corporate organization, with a board of trustees who assume the entire financial responsibility for its maintenance. The departments of instruction are history and philosophy of education; educational administration, psychology, and sociology; secondary, elementary, kindergarten, vocational, religious, and rural education; English, French, German, Greek, and Latin; history, biology, geography, and mathematics; household and industrial arts; music and speech; nursing and health; and physical education and science. No department undertakes work for which adequate provision is made in other faculties of the university. The college maintains a school of observation; the Horace Mann School, with kindergarten, elementary, and high-school departments. The college inaugurated the system of extension teaching now conducted by the university, and issues a number of educational publications. In 1912 the faculty was reorganized into two schools, the school of education, which was placed on a graduate basis, and the school of practical arts. The buildings, five in number, are valued at \$2,551,000. The total registration in 1914-15 was 5110, including 870 in summer session, 1833 special students, 929 in the school of education, and 1070 in the school of practical arts. The Bryson Library contains 58,881 volumes.

TEACHERS' PENSIONS. In all European governments which supervise school systems and regulate the appointment of teachers, it is held that teachers, being officers of the state, are as such entitled to pensions. The systems vary

in the different countries between contributory and noncontributory principles. Germany has fairly generally adopted the latter principle—the state bearing the whole expense of the pensions. France and England require contributions from their teachers. It is felt usually that under a noncontributory system salaries are either depressed or remain stationary longer than under the other system. Germany and France provide also for the widows and orphans of teachers.

Pension systems for teachers in the United States originated late in the nineteenth century in the form of teachers' mutual benefit associations, voluntary clubs paying little more than burial fees, and supported by assessments, entertainments, etc. By 1895 the States of Illinois, New York, and California, and the cities of Detroit, New York, and St. Louis, had provided for the aid of teachers' retirement funds by the use of public money. The city of Brooklyn adopted the contributory system by deducting 1 per cent a year from the teacher's salary. In 1905 the State Legislature, by amending the charter of the city of New York, created a teachers' pension system which was then generally regarded as the most advanced in America. Its later development, however, belied this promise, for in 1915 the fund was reduced so low that it was declared bankrupt, and in 1916 a new system was under consideration, formulated by a Commission on Pensions which was appointed in 1913 to consider all the pension systems of the city.

Interest in pensions for teachers as for other employees has but recently developed. This is evident by the fact that of the 21 State-wide systems in existence in 1916, 15 were established after 1910. The State-wide systems are Arizona, California, Illinois, Indiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New York, North Dakota, Rhode Island, Utah, Vermont, Virginia, and Wisconsin. Of these only Arizona, Maine, Maryland, New Hampshire, Rhode Island, and Virginia have adopted the noncontributory principle. All the others require contributions from teachers which vary in amount as do the time of service required and the amount of the pension. In addition to the above systems a number of States have permissive pension laws, e.g., Kansas, Kentucky, and Ohio, while in others city systems have been established under special laws, e.g., New York and Pennsylvania.

Pension systems in the United States labor under a number of disadvantages, the chief of these being ignorance of the social basis and the actuarial principles that should underlie them. The result is that a large number of systems must either prorrate the promised benefit or else become bankrupt. The great need at present is for sound actuarial information on the whole subject, since the social basis is generally admitted. This latter rests on the recognition that teachers are not paid adequate salaries, that the ordinary avenues of commercial gain are closed to them, and that some system of superannuation is necessary in the interests of an efficient service. But what must yet be established is the relation of the pension to final salary, the responsibility for the contributions, length of service required, and age of retirement, together with some form of disability grant or insurance.

In 1916 the only system that gave promise of permanence was that of Massachusetts. Here the teachers were compelled to make annual contributions of from 3 to 7 per cent of their salaries with which a sum was accumulated out of which annuities are paid. The State collects and administers this fund, and when a teacher is retired after 30 years of service at the minimum age of 60, the amount of the annuity due is doubled by a grant of an equal amount from the State. The total sum may not be as large as those promised in other schemes, but at least has the elements of certainty.

For pensions to university teachers see under CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING which discusses the subject in its annual reports. Consult: C. W. Prosser, *The Teacher and Old Age* (Boston, 1913); United States Bureau of Education, *List of References on Teachers' Pensions* (Washington, 1914); New York City, Commission on Pensions, *Report* (New York, 1915); Massachusetts Teachers' Retirement Board, *Annual Report* (Boston, 1915).

TEACHERS' SALARIES. Competition of women, the temporary employment of men, the classification of teaching with menial services, the low requirements in many parts of the country, and the assumption that this work should be done for the love of it, have kept the wages of teachers in America at or below the point of bare subsistence. The larger cities and towns have adopted schedules of salaries dependent upon the teacher's merit, length of service, and grade of class taught.

In 1898 the New York State Teachers' Association appointed a committee to investigate the cost of living in the various cities in the State, and to compare the figures with the salaries paid to teachers. The committee tabulated what they regarded as legitimate living expenses. This tabulation, with slight variations, has since been used by the teachers' associations of many States in collecting estimates for the minimum salary that should be paid teachers in a given locality.

In New York it was decided that \$600 per year was the proper living wage. Twenty-five dollars a year increase for meritorious service was provided. Promotion to higher grades brought higher wages. This schedule was adopted by the Board of Education in 1898. It is the first American schedule based upon a carefully computed estimate of the cost of living in the community. In 1899 a law amending the charter of the city of New York and forbidding the Board of Education to pay any teacher less than \$600 per annum, the living wage, was passed. This law was in 1900 strengthened by the provision that a specific appropriation of four mills on every dollar of assessed valuation of the taxable property of New York City must be set aside each year as a fund from which the salaries of the teachers may be drawn. The New York City public schools thus illustrate these principles of a salary system: Legal compulsion that the Board of Education shall pay at least what were living wages in 1898; encouragement of permanent teachers by means of annual increase of payments; encouragement of merit by withholding from unprogressive teachers any increase after the fourth year; encouragement of teachers' study and professional growth by higher salaries for higher grades obtainable by examination; retention of

men by salaries permitting the support of a family; protection of the salary fund by requiring a per centum appropriation each year.

Improvements of the detailed working out of these principles have been suggested. Living expenses have increased 30 per cent since these schedules were made. The Board of Education has the power to increase the schedules without limit other than those set by the money available.

Since the adoption of the living-wage schedule, California, Colorado, Indiana, Iowa, Kentucky, Maryland, Mississippi, Missouri, New Jersey, North Dakota, Ohio, Pennsylvania, Rhode Island, Utah, West Virginia, and Wisconsin have passed minimum salary laws forbidding school boards to pay teachers less than specified sums, while a few have regulated the maximum salaries for certain grades of certificates, e.g., New Mexico, North Carolina, and Texas. Some States, such as California, Nevada, and Utah, together with New York City, are required to pay equal salaries for equal services to men and women teachers.

As the cost of living varies to such an extent in different localities, no table of averages of

POPULATION	Elementary teachers	Average salary	High-school teachers	Average salary
250,000 and over	34,618	\$1,018	5,067	\$1,746
100,000 to 250,000	9,817	791	1,896	1,216
50,000 to 100,000	9,393	688	1,655	1,069
25,000 to 50,000	9,335	641	1,941	1,009
10,000 to 25,000	12,272	602	2,581	897
5,000 to 10,000	9,948	533	2,342	795

teachers' salaries for the entire country is of value. The preceding table shows the average salary of teachers according to population of the cities.

TEACHING OF THE TWELVE APOSTLES (Gk. διδασχὴ τῶν δώδεκα ἀποστόλων, *didachē tōn dōdeka apostolōn*), also called the DIDACHE. An ancient Christian document, written in Greek, probably between 120 and 150, of great value for the study of organization, belief, and worship in the early Church. It was found in 1873 by Bryennios (q.v.), Metropolitan of Nicomedia, in an eleventh-century manuscript in the Monastery of the Holy Sepulchre in Constantinople, and was published by him 10 years later. Modern editors include it, by general consent, among the Apostolic Fathers (q.v.). The *Teaching* was apparently compiled from earlier material, for use as a church manual. It contains a description of the Two Ways, one of life, the other of death, in the form of rules for Christian conduct. Whether or not this part of the *Teaching* was originally separate from the rest, it is evident that it was used in

catechetical instruction to prepare converts for baptism. It appears in slightly different form in the Epistle of Barnabas. The second portion of the *Teaching* sets forth the proper observance of the rites of baptism and the Lord's Supper, with directions for their administration, and defines the office and duties of the Christian leaders, especially apostles, prophets, teachers, bishops, and deacons. Ceremonial and organization are alike extremely simple. The whole concludes with a paragraph announcing the speedy second coming of Christ and the final judgment.

The *Teaching* was held in high honor in the early Church, and is quoted by Clement of Alexandria as Scripture. It forms the basis of the seventh book of the *Apostolic Constitutions* (q.v.), and bears some literary relationship to the *Shepherd of Hermas* and perhaps to the *Apology* of Aristides. Most critics are inclined to attribute it to Syria or Egypt, but no decisive argument exists for either. By the fourth century the *Teaching* had taken its place definitely among the ecclesiastical as distinguished from the canonical books.

Bibliography. J. R. Harris, *The Teaching of the Apostles* (Baltimore, 1887, contains facsimiles of the manuscript); Philip Schaff, *The Teaching of the Twelve Apostles* (3d ed., New York, 1889); Krüger, *History of Early Christian Literature* (ib., 1897); T. C. Cruttwell, *Literary History of Early Christianity* (2 vols., ib., 1889, contains an English translation); Kirsopp Lake, *Apostolic Fathers*, in "Loeb Classical Library" (ib., 1912). The text will be found critically edited, in Funk, *Patres Apostolici* (2d ed., Tübingen, 1901).

TEAGUE, tēg. A city in Freestone Co., Tex., 126 miles north of Houston, on the Trinity and Brazos Valley Railroad. It is in a productive cotton-growing region, and has a cotton-oil mill and compress. Railroad repair shops are situated here. Pop., 1910, 3288.

TEA INSECTS. The tea plant is attacked by several injurious insects, as the fagot worm (*Eumeta carmerii*), one of the bagworms, whose larva carries a case made up of fragments of twigs and feeds upon leaves of the plant. The tea borer (*Zenzera coffea*) is the larva of a cossid moth; it bores into the stems of both coffee and tea plants. Three species of bark lice (*Aspidiotus theae*, *flavescens* and *transparens*) also occur commonly upon tea, and the first named is one of the most serious enemies of the growing plant, very noticeable at the time of pruning. Three mites feed upon the leaves, one of them a red spider (*Tetranychus bimaculatus*), another the five-legged tea mite (*Typhlodromus carinatus*), closely related to the rust mite of the orange. It feeds upon the lower leaves. The yellow tea mite (*Acarus translucens*) feeds upon the buds and produces the condition called "sulky." Consult Watt, *The Pests and Blights of the Tea Plant* (Calcutta, 1898).

STICK-COVERED COCOON OF A FAGOT WORM.

TEAK, *ték* (Malayan *tekka*, Tamil *tekku*, teak tree). Two kinds of timber, valuable for ship building and other purposes. Indian teak (*Tectona grandis*) belongs to the family Verbenaceæ; African teak or African oak (*Oldfieldia africana*) to the Euphorbiaceæ. The former is found in the mountainous parts of Malabar and other parts of southeastern Asia. The teak forests of India are mostly under governmental control and yield a considerable revenue. The usual practice is to girdle the trees and allow them to stand for two years to season thoroughly before felling. Teak has been introduced in some parts of India in which it is not indigenous. It is a beautiful tree, rising above all the other trees of the East Indian forests, sometimes attaining a height of 200 feet. Silk and cotton stuffs are dyed purple by the leaves. The timber, which will sink in water unless dry, is one of the most valuable produced in the East; it resembles coarse mahogany, is easily worked, strong, durable, and not liable to the attacks of insects. It is largely used for furniture, some of which is handsomely carved, and for shipbuilding, for which purpose it is exported. The teak generally grows rather in clumps in forests than in forests of itself. African teak is adapted to the same uses as the Indian teak, though it is not quite as durable. On account of the growing scarcity of teak timber other species are sought to supply the demand for similar material. Among substitutes are the timbers of *Sloetia sideroxylon*, *Parinarium oblongifolium*, and a tree locally known as ironwood. All are found in the Malay Peninsula and Dutch East Indies. Efforts have been made to grow Indian teak in Nigeria, and tests of timber from young planted trees have been highly satisfactory.

TEAL, *tél* (connected with Dutch *teiling*, teal, brood, *telen*, to breed, and perhaps with AS. *tilian*, Eng. *till*, OHG. *zil*, Ger. *Ziel*, object). One of a group of small beautiful fresh-water ducks, mostly in the genera *Nettion* and *Querquedula*. They are migratory, going to the tropics for the winter, and when in the United States are shy and silent, feeding chiefly at night on water plants, seeds, worms, and insects. They make their nests usually at some distance from water, and lay greenish, or in some species cream-colored, eggs. Species of these two genera are known in all parts of the world. The commonest North American species is the green-winged teal (*Nettion carolinense*). This fine bird is nearly the same as the common teal (*Nettion crecca*) of the northern parts of the Old World. About a dozen other species are met with in Asia, Africa, and South America, all favorites among gunners and epicures. The blue-winged teal (*Querquedula discors*), represented in Europe by the garganey (q.v.), is very abundant in many parts of North America. It is rather larger than the common teal. The head and neck are blackish with a large white crescent in front of the eye. The wing coverts are sky-blue, and the under parts are purplish gray with black spots. The cinnamon teal (*Querquedula cyanoptera*) is also blue-winged, but the general color is rich purplish chestnut and there is no white on the head. This is a South American duck, which is also common west of the Rocky Mountains as far north as Oregon. Two other species belong to South America. Consult authorities and Plate under Duck.

TEALL, *té'al*, JETIRO JUSTINIAN HARRIS (1849-). An English geologist, born at Northleach, Gloucestershire. He studied at St. John's College, Cambridge, of which he was a fellow in 1875-79. Teall served as director of the Royal Geological Survey and Museum of Practical Geology in 1901-13 and was a member of the Royal Commission on Coal Supplies in 1901-05. He was highly honored by scientific bodies, being president (1900-02) of the Geological Society of London, from which he received the Bigsby and Wollaston medals in 1905; president of Section C of the British Association (1893), vice president of the Royal Society of London (1900-01), and Delesse prizeman of the Academy of Sciences, Paris (1907). Besides papers on geology and petrology Teall wrote *British Petrography: with Special Reference to the Igneous Rocks* (1888).

TEANO, *tá-á'nò*. A city in the Province of Caserta, Italy, 42 miles north-northwest of Naples, at the foot of the extinct volcano Rocca Monfina (Map: Italy, D 4). It was one of the leading cities of Campania. The present town is interesting for its old ruins, among them a castle. Pop. (town), 1911, 6067.

TEARS OF THE MUSES. A poem by Edmund Spenser, published in 1591.

TEASEL, *té'z'l* (AS. *tasel*, OHG. *weisala*, *teasel*, from AS. *tasan*, Bavarian Ger. *zaiven*, to tease wool), *Dipsacus*. A genus of plants of the family Dipsacaceæ. The only valuable species is the fuller's or clothier's teasel (*Dipsacus fullonum*), a native of southern Europe,

TEASEL (*Dipsacus sylvestris*).

naturalized in the United States. It is a biennial, several feet high, with sessile serrated leaves, prickly stems and leaves, and with cylindrical heads of pale or white flowers, between which are oblong, hook-pointed, acuminate, rigid bracts. The plant is cultivated for the heads, which are cut off when in flower, and are used for raising the nap of cloth, a purpose for which no mechanical contrivance has been found to equal them. The split heads are fixed on the circumference of a cylinder, which is made to revolve against the surface of the cloth. The wild teasel (*Dipsacus sylvestris*), from which fuller's teasel is supposed to have origi-

nated, has straight instead of hooked prickles on the heads. It is a common and troublesome weed in some parts of the United States.

TEA TREE. See *CAMEPURT*.

TEA-WATER PUMP. A spring famous in New York during the eighteenth and part of the nineteenth century. It was situated north of the present City Hall Park, on Chatham Street, and was for a long time the chief source of supply for drinking purposes, owing to the purity of its water.

TEAZLE, tē'z'l, LADY. A sprightly country-bred girl who is married to an exacting but kind-hearted old gentleman, Sir Peter Teazle, in Sheridan's *School for Scandal*.

TEBRIS. See *TABRIZ*.

TECHE (tēsh) BAYOU. A bayou in Louisiana (Map: Louisiana, F 6). It leaves the Bayou Courtaulau, in St. Landry County, and flows southeast in a course of about 100 miles, during which it sends off numerous branches to the Atchafalaya Bayou, and finally empties into that bayou below Grand Lake, sending also several widely separated arms directly to the Gulf of Mexico. It is interesting as having been anciently a main outlet of the Red River, and is lined with high and extensive alluvial banks which form excellent agricultural lands safe from inundations. The bayou is navigable for steamers to St. Martinsville, about 90 miles.

TECHNICAL EDUCATION (from *technic*, from Gk. *τεχνικός, technikos*, relating to art or handicraft, from *τέχνη, technē*, art, handicraft, from *τίκτειν, tiktein*, to bring forth, produce). The term technical education, strictly speaking, embraces all instruction that has for its object the direct preparation for a career or vocation. In common use, the designation is applied to such instruction as bears directly upon the industrial arts. The field of such education ranges from instruction in the arts and sciences that underlie industrial practice in its broadest and most complex relations to the simple training in manipulation needed for the prosecution of some productive trade. This wide province naturally calls for numerous and widely divergent types of schools.

Technical schools may conveniently be divided into three classes: (1) Institutions of a collegiate or university grade, to which the titles engineering schools, institutes of technology, polytechnic institutes, and schools of applied science are variously given, and which are devoted to instruction in advanced mathematics and science, and the theory and practice of industrial operations. (2) Schools in which the purpose is to prepare for practical work in some particular field of industry and which afford instruction in those branches of science and art that underlie its special problems. This class is represented by schools of weaving, dyeing, building, and machine construction and drafting. The term technical school has been used in a specialized sense in this article to denote institutions of this character. In this class may be grouped schools of industrial art in which the study of design is supplemented by training in manipulation. Evening continuation schools which afford instruction in science, art, and technical methods may also be considered in this group. (3) Trade schools which supply a training in the practice of some productive trade. The function of the first type of school is to educate its students for managers and superintendents of industrial establishments, consulting

and designing engineers and architects, etc.—in other words, to supply leaders and organizers for the industrial world; that of the second, to provide foremen, designers, and experts in special lines of industrial practice; and that of the third, to train craftsmen for practical work at a trade.

Engineering Schools; Schools of Applied Science; Institutes of Technology. The earliest establishment of this type of school occurred in France and Germany. In France the Ecole des Ponts et Chaussées, originally started in 1747 as a drawing school, was organized in 1760 for the training of engineers for the government service. In 1794 the celebrated Ecole Polytechnique was founded, primarily to fit men for the engineer and artillery corps of the French army. Not only has this school done much to set the standard of scientific training for the state service, but, from the fact that many of its graduates have engaged in private work, it has exerted a strong influence upon general industrial practice. Other special engineering schools have been established at different times by the French government, and in 1829 the Ecole Centrale des Arts et Métiers was founded as a private institution. The standards of this school have always been of the highest character. In Germany the first institution that approached a modern engineering school was the School of Mines founded at Freiberg in 1824, in order to develop engineers for working the mines in the neighborhood. Later in the century came the great development of pure science in the German universities, and following this came an era of equal activity in the field of applied science, which quickly resulted in the widespread establishment of polytechnics or *Technische Hochschulen*. Rivalry between the various states played a part in the spread of these schools, each striving to outdo the others in magnificence of buildings and completeness of equipment. These institutions, which often had their beginnings in secondary technical or trade schools, have now become foundations coordinate with the universities, requiring equal academic preparation for admission, and representing specialized courses in engineering, architecture, industrial chemistry, and agriculture. Schools of this kind are uniformly supported by the governments of the various states, and present a very highly developed organization. The splendid Technische Hochschule at Charlottenburg, and similar institutions at Munich, Dresden, Darmstadt, Hanover, Cassel, Aachen, and Breslau are foremost examples of this class. Engineering schools of a high grade are maintained also by the governments of Austria, Italy, Switzerland, Sweden, and Russia. Great Britain awakened more slowly to the need of technical education than other European countries, the chief stimulus being interest aroused by the Exhibition of 1851. In 1881 a Royal Commission on Technical Instruction was appointed to investigate the entire subject. Among other results of this awakening was the foundation of the City and Guilds of London Institute, formed by a union of many of the wealthy corporations of the old London guilds. The scope of the Institute activities includes the support and management of three institutions and the support of several others in the city of London, and the direction of a system of examinations dealing with the work of technical classes throughout England and Wales, and represents a system that touches all

the important phases of technical instruction with the single exception of the trade school. The most important of the three schools established in London, the Central Institution of the City and Guilds of London Institute, a well-organized school of technology, now forms a part of the Imperial College of Science and Technology, and is recognized as a school of the University of London in the faculty of engineering. The Institute gave £100,000 for buildings and equipment, and annually contributes £10,000 to its support. Courses are provided for training engineers, architects, industrial chemists, and technical teachers. Other schools of an advanced character and several university departments of applied science have come to the front in Great Britain, prominent among which are the University of Manchester, the Manchester School of Technology, the University of Birmingham, the University of Leeds, the University of Sheffield, Armstrong College, and a number of others. In 1913-14 the Board of Education paid grants to 24 different institutions for technological and professional work, all of university grade. Schools of engineering are maintained at the University of Glasgow, the University of Edinburgh, University College of Dundee, and the Glasgow and West of Scotland Technical College.

In the United States the development of the school of technology has been exceedingly rapid, and has resulted in a type of institution that in some respects is the superior of anything to be found abroad. The Rensselaer Polytechnic Institute (q.v.), founded in 1824 by Stephen Van Rensselaer as a school of theoretical and applied science, was the first establishment in this field. The work of this school has been almost exclusively devoted to the training of civil engineers. In response to the growing demand for scientific instruction, the Sheffield Scientific School (1847) at Yale and the Lawrence Scientific School (1848) at Harvard were founded. Most of the technical schools, however, date from the later years of the Civil War. In 1861, through the efforts of Prof. William B. Rogers, the charter of the Massachusetts Institute of Technology (q.v.) was granted, and in 1865 the first classes were organized. The Worcester Polytechnic Institute (q.v.) was opened to students in 1867. This was the first school of technology in the United States to provide systematic instruction in workshop practice as an element of the course in mechanical engineering. In 1864 the first courses in the School of Mines, Columbia University, were organized, and from this have developed the several schools of applied science of that institution. In 1871 the Stevens Institute of Technology (q.v.) at Hoboken was opened. The beginnings of the Sibley College of Mechanical Engineering and the Mechanic Arts were made at Cornell University in 1872, and other courses in applied science were soon established there. In the next 20 years a large number of schools of the first rank were founded either as separate institutions or as departments of universities. Notable among those of the first kind are Purdue University (q.v.), Lafayette, Ind.; Rose Polytechnic Institute (q.v.), Terre Haute, Ind.; the Michigan School of Mines, Houghton, Mich.; the Case School of Applied Science (q.v.), Cleveland, Ohio; and the Armour Institute of Technology (q.v.), at Chicago, Ill. Prominent among the second group are the engineering departments of

Lehigh University, the Ohio State University, Washington University (St. Louis), and the universities of Michigan, Wisconsin, Minnesota, Pennsylvania, and California. The State land-grant colleges established under the Morrill Act of 1862 also gave a great impetus to the study of engineering and mechanic arts. See MORRILL, JUSTIN S.

The history of these schools has been marked by the development of a number of very significant features of instruction. To begin with, emphasis has from the first been placed upon the laboratory method of instruction, as opposed to sole reliance upon textbooks. Following the organization of instruction in pure science came that in applied science. Another feature that has characterized the instruction in many of these institutions is the degree of specialization in the instructing staff made possible by the large numbers of students. The courses of study of American schools of technology almost universally extend through four years.

Technical and Applied Art Schools; Continuation Schools. All the types of this group of institutions have reached a high point of organization on the continent of Europe. Technical schools, in which to practical training in the methods of a special craft is added instruction in the scientific principles upon which they are based, appear in greatest numbers in Austria, Germany, and France. Some have been established by guilds or masters' societies, some by a union of manufacturers of a town or city wishing to improve the efficiency of their establishments, and others by action of the local authorities or by the government. A steady tendency towards government control and support is apparent in all the continental countries. Prominent among schools of this type are the special schools for weaving and dyeing, of which frequent examples are found in various parts of Germany. The most famous institution of the kind is located at Krefeld, in Prussia. In this model institution very thorough study is made of the chemistry and technology of dyeing, and of the mechanism and pattern designing involved in weaving. The Advanced School of Weaving at Lyons, France, the School of Silk Weaving near Zurich, Switzerland, the School of Weaving and Dyeing at the University of Leeds, and the textile departments of the Manchester School of Technology and of the Bradford Technical College, are other examples of this type of school. In the United States similar schools are the textile and dyeing schools of the School of Industrial Art of the Pennsylvania Museum at Philadelphia and the textile schools at Lowell and New Bedford, Mass.

Another type of technical school found in Germany and Austria is the *Baugewerbeschule* or building trades school. These schools are generally open during the winter months alone. Only students are admitted who have had practical experience in some branch of the trade, and the courses deal with the principles and practice of building construction, the nature of materials, mechanical and freehand drawing, modeling, science, mathematics, and bookkeeping. The courses generally run through four terms and are strictly professional in character. Many of the *Fachschulen* of Austria, although aiming at trade instruction, might well be classed as technical schools on account of the character and extent of the technical instruction that is offered in addition to the practical work.

Another form of technical school is represented by a class of institutions of the secondary grade, which aim to prepare rather for entrance into industrial work than for direct mastery of any one special branch. In these schools the courses commonly include instruction in the elements of a general education, as well as the study of applied science and practical training in a number of representative industrial processes. The *Industrieschulen* and *Gewerbschulen* of Germany and Austria are examples of this type. Courses in these schools are generally from three to five years in length, and embrace, besides practical industrial work, instruction in mechanical and freehand drawing, geography, business forms, mathematics, bookkeeping, science, and technology. Schools of this kind are found at Döslin, Chemnitz, Cologne, Düsseldorf, Leipzig, Munich, and Nuremberg. In Austria the School of the Technological Industrial Museum, at Vienna, is the foremost example, and serves as a model for all other schools of this class throughout the Empire.

France has a very important and highly organized system of state schools for the training of foremen and superintendents in mechanical industries at Chalons, Aix, Angers, Cluny, and Lille. The courses are three years in length. The instruction, both practical and theoretical, given in these schools, has been of so thorough a character that the result in large part has been to train managers and mechanical engineers rather than foremen. Other technical schools of an advanced character in France are the Industrial Institute of the North of France, at Lille, and the Institution Livet, at Nantes, which is a private foundation. A school of a special type exists at Lyons, the *Ecole Martinière*. Distinct courses are provided for boys and girls. In the former the sciences and arts are studied in their relation to commerce and industry. The object is not to prepare for any special trade, but to develop general capacity for an industrial or commercial career. The course, which lasts for three years, is very similar to those of the American manual-training schools. The courses for girls aim to furnish a trade training in commercial accounting, embroidery, industrial drawing, and women's tailoring, together with a general education. The Finsbury Technical College, in London, is the most important institution of this class in England. Several well-equipped schools of this general type exist in other parts of England, among which are the Manchester School of Technology, the Birmingham Technical School, and the Sheffield Technical School. In the United States the manual-training high schools (see *MANUAL TRAINING*) approach quite close to this last category of schools, but devote a larger proportion of time to general branches; more nearly similar are the recently developed technical and vocational high schools that have been established, for example, in Chicago, Cincinnati, and Fitchburg.

Schools of industrial or applied art have also reached their highest point of development on the continent of Europe. In Austria and Germany the *Kunstgewerbeschule*, often connected with an extensive and admirably filled museum, is found in all the large cities. Courses in drawing, painting, modeling, and design are provided, leading to some special branch of applied art. In some schools, notably those at Munich and Vienna, the handicraft side is prominent and much attention is given to practical work at

carving, metal chasing, stained glass, leather embossing, fresco painting, embroidery, porcelain painting, lithography, smithing, and other lines. In France are to be found not only the first schools of painting, sculpture, and architecture in the world, but also the most thorough organized provision for instruction in decorative and industrial art. The government lends liberal support to the art schools, and assists in establishing new ones when the need of such is manifest. Some are supported entirely by the state, and others are assisted through grants. All are under the direction of the Minister of Public Instruction and Fine Art. Excellent schools of applied art are to be found in all parts of France, often with a distinct trend of instruction towards the industries prominent in the locality, as in the case of ceramics at Limoges and textiles at Roubaix. In Paris there are three schools which afford instruction in industrial art—the *Ecole Nationale des Arts Décoratifs*, the *Ecole Germain-Pilon*, and the *Ecole Bernard-Palissy*; the first to teach the principles of design in relation to industrial art as a whole, the last with direct reference to certain trades, with a liberal amount of workshop and laboratory practice. The great schools of the Government Science and Art Department (now under the Board of Education for England and Wales) at South Kensington represent the most important provision for instruction in industrial art in Great Britain. The work of these schools consists largely of drawing, painting, and modeling, and although the application of art to industry is counted as the main purpose of the institution, no practical work is attempted. A large number of smaller schools patterned upon the same model exist in other parts of Great Britain under the guidance and financial assistance of the Board of Education.

In the United States schools of applied art are not numerous, and in few cases is a training in the practical application of design attempted. Prominent among the institutions affording instruction in this field are the Cooper Union (q.v.), of New York City; the School of Industrial Art of the Pennsylvania Museum; Pratt Institute (q.v.), Brooklyn, N. Y.; Drexel Institute (q.v.), Philadelphia; the Maryland Institute, Baltimore; the Art Academy, Cincinnati; the Chicago Art Institute; the Rhode Island School of Design, Providence; and the Lowell School of Design, Boston.

Evening classes in science, drawing, design, and technical studies may well be considered in this second general group of schools. The *Fortbildungsschulen* of Germany and Austria are both day schools and evening schools. By the *Reichsgewerbeordnung* (Imperial Industrial Law) of 1891 and 1900 local communities may make attendance upon such schools compulsory for both boys and girls between 14 and 17 years old, and such attendance is often a condition of employment. This law merely incorporated in the statutes conditions that had sprung up after the Franco-Prussian War. Freehand and mechanical drawing, and special instruction relating to the trades of the locality, are the principal subjects taught in such schools. In Vienna every prominent trade is represented by a special *Fortbildungsschule*, and Berlin supports a great number and variety of similar schools. The most notable development in this field has taken place in Munich under Dr. G. Kerscheneister. Attendance at a continuation school is here

compulsory for boys up to 18, and for girls for three years. Twelve general courses for unskilled laborers and errand boys and more than 50 trade schools for apprentices have been established. Close relations have been established between the schools, local trades, and industries, and special attention has been given to developing suitable methods of instruction, courses of study, and to securing the right type of teachers. The best state-wide system of continuation schools is that of Württemberg. Evening industrial schools played an important part in the thickly populated manufacturing centres of Belgium, where, in such towns as Liège, Brussels, and Seraing, thousands of workmen nightly received scientific and technical instruction bearing on their trades. There are many technical schools in Paris and other cities and towns of France that provide evening instruction. In most cases such evening classes are supported by commercial or industrial societies and bear upon the local industries.

Nowhere else is the organization of evening industrial classes carried to so high a point as in Great Britain. Through the system of examinations and grants directed formerly by the Science and Art Department, now part of the Board of Education, classes in drawing, modeling, design, mathematics, and many branches of science and technical subjects are maintained throughout the United Kingdom. From 1879 to 1890 the City and Guilds of London Institute performed a similar function for technical and industrial classes. By their liberal financial assistance through examination grants, not only were all manner of technical courses organized throughout the country, but practical trade classes were opened to broaden and further the experience of those engaged in the trades. The Act of 1889 which authorized local authorities to build and maintain technical schools, and to contribute to evening technical classes out of the local rates, followed by the Law of 1890 which set aside a portion of the excise duties for the support of such schools, rendered the financial assistance of the Institute no longer essential, and since 1890 that association has confined its grants to classes in the city of London. The Institute continues its functions as an examining body, and is recognized as setting the standard for all work in this field. Since the beginning of the century the tendency has been in the direction of organizing evening work in courses of a progressive nature spread over four or five years, in order to secure some correlation and unity and to prevent a scattering of interest and energy.

In the United States such evening schools rapidly assumed an important place. The free evening classes of the Cooper Union have provided an opportunity for thousands of young men to advance themselves. The evening classes of the Pratt Institute, Brooklyn, N. Y., represent an important and highly developed example of such instruction. Worthy of mention are also the Drexel Institute, Philadelphia; the General Society of Mechanics and Tradesmen, New York City; the drawing school of the Franklin Institute, Philadelphia; the Lewis Institute, Chicago; and the evening classes conducted by Young Men's Christian Associations all over the country.

Trade Schools. These institutions have come into existence almost entirely since the middle of the nineteenth century. The industrial con-

ditions produced by an era of quantity of production and division of labor have developed the real problem of the trade school. In the days of the old guilds, when both production and exchange were in the hands of the master workman, the natural provision for trade training was found in the apprenticeship system. As soon, however, as the master workman ceased to be both merchant and craftsman, the apprentice began to lose his natural position in the industrial order. In most trades the master workman has developed on one side into the director of an industrial establishment, or has become the foreman of a large number of workmen. From this situation, and from the fact that the specialization of labor in most trades dependent upon machinery renders any comprehensive training in such trades under ordinary conditions impracticable, and also because of the restrictive regulations of trades-unions as to apprentices, arises the modern demand for the trade school. Manual dexterity and knowledge of processes are naturally the primary object in such schools. Examples of this kind of school, in spite of a general notion to the contrary, are not numerous even on the continent of Europe.

In Germany and Austria it is considered unwise to introduce purely technical instruction into the period of the common school, so that all schools for technical training admit only pupils more than 14 years of age. Besides the *Gewerbeschulen*, of a secondary grade, are the *Fachschulen*, or schools which deal with the training for some one special trade. These schools are distributed in industrial centres throughout the two empires according to local needs. In some of these schools the courses range from two to four years, and include instruction in drawing, elementary mathematics, science, and the technology of the particular trade. From the nature and range of instruction, many of these would be more properly classified as technical schools, and even in the cases where the object is simply to combine the elements of a general education with the training of a craftsman, the length of time required prevents any large attendance of the artisan class. The actual effect is consequently to train a few foremen and superior workmen, rather than to feed the ranks of the large army of workers. In some of the large cities, notably in Berlin and Munich, numerous evening trade classes are maintained, which afford the learner already apprenticed at a trade most practical opportunities to increase his skill, as well as to broaden his knowledge. In Belgium several distinctive trade schools exist, among which those at Tournay and Ghent are prominent. To these schools are admitted boys from 13 to 16 years old, who spend three years in the practice of a particular trade, together with study of general branches and drawing. Trade schools for girls have also received much attention in Belgium. In certain special trade schools in Belgium the experiment of paying the pupils for coming to the schools, in order to compensate for the loss of wages, has been made.

But it is in France that the question of training for the trades has received the greatest official attention and that the organization of schools for such training has reached the highest point. By the Law of 1880 provision was made for the establishment of *écoles manuelles d'apprentissage* as a distinct class of the *écoles pri-*

maîtres supérieures. These schools were intended either to prepare for or to shorten the period of apprenticeship, and were placed under the joint control of the Ministry of Public Instruction and the Ministry of Commerce and Industry. In them workshop training plays a prominent part, but a liberal amount of general instruction is also given during the three years' course. Pupils are admitted when 12 or 13 years old. By an administrative blunder, the feature of the Law of 1880 creating such schools remained inoperative until 1888, except in Paris, where the municipality early equipped and developed three successful trade schools, one for wood and metal working, one for furniture making, and one for the book industries. After 1888 apprenticeship schools began to appear in the provinces, but inasmuch as no common programme has been defined, the amount of practical instruction varied considerably, and in many cases was far too small to serve as a substitute for apprenticeship. In 1892 the failure of these provincial schools to fulfill their intended function led to a new law, which provided that all the *écoles primaires professionnelles*, in which practical work formed an important part, should be made into a new class of schools called *écoles pratiques de commerce ou d'industrie*, to be placed under the sole control of the Ministry of Commerce and Industry. The organization of such schools, in which the amount of practical instruction is increased to 30 or 33 hours a week, represents a deliberate attempt to establish a comprehensive system of primary trade schools under state control. In Switzerland the state and municipalities support numerous trade schools, mainly for watch-making, in which the training, both practical and theoretical, is of a very thorough character. Another feature connected with trade training in Switzerland, and one that has to some extent been copied in Germany, is a system of apprentice examinations supervised and supported by the state. These examinations in many cantons are made obligatory upon every apprentice, and consist of an examination held at the end of the term of apprenticeship upon the practice and theory of his trade. The trade school can hardly be said to have gained a foothold in Great Britain, where the sentiment almost universally prevails that the shop is the only proper place for learning a trade.

In the United States a distinctive type of trade school was developed in the foundation of the New York trade schools in 1881. Both day and evening classes are conducted in this institution. The evening classes, although admitting beginners, are largely made up of young men already started at their trades. In the day classes young men are admitted only at an age—from 17 to 25—when they will be able to learn rapidly, and so acquire sufficient skill in short courses of four months to enter at once upon practical work. The purpose is to give a thorough grounding in the practice and theory of a trade which may be perfected by later experience in regular work. The school instruction is confined entirely to practical work. Evening schools similar to those of the New York trade schools have been established by the Pratt Institute, Brooklyn, the Philadelphia Master Builders' Exchange, and the Massachusetts Charitable Mechanics' Association of Boston. To these should be added the first instance of public support of such an institution in the Evening School of Trades at Springfield, Mass.

Another type of trade school has made its appearance in the United States in the Williamson Free Schools of Mechanical Trades (q.v.) near Philadelphia, in the Baron de Hirsch Trade School of New York. A number of public trade schools have also been established since 1907, e.g., Milwaukee School of Trades, and others at Philadelphia, Portland, Oreg., Worcester, Mass., and Indianapolis. Institutions similar in plan to some of the European trade schools, in which the aim is to combine the teaching of a trade with a general education, are represented by the California School of Mechanical Arts and the Wilmerding School of Industrial Arts of San Francisco. Of a lower grade are the preparatory schools that have developed since 1908, when the first school of type was founded at Rochester, N. Y., to give some knowledge of industries and shop methods to boys between the ages of 14 and 16. A number of similar schools have been established in Massachusetts.

In addition to the regular institutions, noted above, several instances exist in Europe and the United States of factory or employees' schools. These schools are almost uniformly conducted in the evening, although the practice is not uncommon of allowing time off to younger employees to attend school during working hours, and in the main provide instruction of a nature related to the practical work of the employees, such as drawing and mathematics. Examples of such schools in the United States are those conducted by R. Hoe & Co., printing-press manufacturers, of New York City, and the Cleveland Twist Drill Co. The Ludlow Manufacturing Co., of Ludlow, Mass., which employs large numbers of women and girls, supports an evening school giving instruction in cooking, sewing, and physical culture. Somewhat similar classes are carried on by the National Cash Register Co., of Dayton, Ohio. Employees' schools in which specialized technical instruction is given are conducted by several associations of employees and also by individual manufacturing concerns in various parts of France. Quite different from such schools are the schools for the children of employees, which are maintained by a number of large industrial corporations in Great Britain, France, and Germany. Notable among these are the schools of Lever Brothers, Port Sunlight, England; of the Krupp Works, Essen, Germany; and the Trade School of the Northern Railway Co., Paris.

TECK, ALEXANDER, PRINCE OF (1874-). A British soldier. He was born at Kensington Palace, London, the third son of the Duke of Teck and Princess Mary Adelaide, and a brother of Queen Mary, consort of George V. Educated at Eton and at the Royal Military College, Sandhurst, he became successively a captain in the Seventh Hussars and in the Royal Horse Guards, and later was brevetted lieutenant colonel in the Second Life Guards. He served in Matabeleland in 1896, in the South African War in 1899-1900, and in the European War in 1914-15, being mentioned in the dispatches in each. For services in the South African War he also gained the Queen's medal with five clasps and was made a member of the Distinguished Service Order. In 1914, before the outbreak of the war, he was appointed Governor-General of Canada; but it was later decided to retain the Duke of Connaught in this office until the end of the war. Prince Alexander married in 1904 Princess Alice, daughter of the Duke of Albany and granddaughter of Queen Victoria.

TECUCIU, tã-koo'chë. A town of Rumania, in Moldavia, 40 miles northwest of Galatz, on the right bank of the Berlad River (Map: Balkan Peninsula, F 2). It has an active trade. Pop., 1900, 13,405.

TECUMA (tã'koo-mă') **PALM.** See ASTROCARYUM.

TECUM'SEH. A city and the county seat of Johnson Co., Neb., 48 miles by rail southeast by south of Lincoln, on the Nemaha River, and on the Chicago, Burlington, and Quincy Railroad (Map: Nebraska, H 4). It is the trade centre of a stock and farming region. Tecumseh has a Carnegie library. Pop., 1900, 2005; 1910, 1748.

TECUMSEH (Flying Panther, Meteor), TECUMTHE, or TECUMTHA (c.1775-1813). A famous Indian chief, born near the site of the present town of Springfield, Ohio. When about 35 years of age he formed a plan for a great confederacy of the Indians against the whites, which should have jurisdiction, among other things, over the alienation of Indian lands. In this work he was assisted by his brother Elkswatawa or Tenskwatawa (q.v.), commonly known as The Prophet, and by British agents. In the summer of 1808 Tecumseh and his brother established a village near the mouth of Tippecanoe Creek in Indiana, and here Tecumseh put into practice some of his ideas for returning to the virtuous primitive condition of the Indians by prohibiting the use of whisky and other demoralizing practices introduced by the whites. Three years later he went on a visit to the southern Indians, especially the Choctaws, Creeks, Cherokees, and Seminoles, and by his wonderful eloquence is considered to have kindled among them the flame that in 1813 burst into the Creek War. In his absence, however, his followers were defeated on Nov. 7, 1811, by a force under Gen. William Henry Harrison. (See TIPPECANOE, BATTLE OF.) In the following year he joined the British at Malden, and early in August routed a force of Ohio militia, but was defeated and wounded in the skirmish of Maguaga. Despite his defeat, however, he was commissioned a brigadier general in the British army, and with several hun-

dred Indians assisted in the capture of Detroit. In January, 1813, he played an important part in the siege of Fort Meigs (q.v.), and prevented the massacre of prisoners taken in the sortie from the fort. He was killed at the battle of the Thames (q.v.), while bravely resisting the attack of the mounted Americans under Col. Richard M. Johnson. Tecumseh was a man of many high qualities, with impressive manners and wonderful natural eloquence. Consult: Drake, *Life of Tecumseh and his Brother, the Prophet, with an Historical Sketch of the Shawnee Indians* (Cincinnati, 1841); W. J. Armstrong, in *Heroes of Defeat* (ib., 1905); Eggleston and Seelye, *Tecumseh and the Shawnee Prophet* (New York).

TEDAS, tã'dáz. The northern division of the Tibbus (q.v.), living in Tibesti and the adjoining oases of the eastern Sahara, and connected with the outside world by the main camel route between the city of Tripoli and Lake Chad. In this portion of the great desert are inexhaustible supplies of rock salt, and the Tedas employ thousands of camels in conveying this material throughout Central Africa.

TED'DINGTON. A residential town in Middlesex, England, on the Thames, 13 miles west of London (Map: London and Vicinity, F 4). The municipality maintains reading rooms and recreation grounds, and provides garden allotments. The National Physical Laboratory was inaugurated here in 1902. Pop., 1901, 14,029; 1911, 17,847.

TE DE'UM. A well-known hymn, so called from its opening words (*Te Deum laudamus, Te Dominum confitemur*, We praise Thee, O God, we acknowledge Thee to be the Lord), commonly sung on all occasions of triumph and thanksgiving, and a theme upon which the most celebrated composers have exercised their musical genius. The hymn is one of the most simple, and at the same time the most solemn and majestic and most admired in the whole range of hymnology. Its authorship is uncertain. Picturesquely and uncritically it has been described as the joint production of Saints Ambrose and Augustine, into which they both burst forth by a common inspiration on occasion of the baptism of Augustine. From this supposed origin the *Te Deum* is commonly called the Ambrosian hymn. It has been ascribed to Hilary of Poitiers, and, in recent years, to Nicetas of Remesiana (c.400). Besides its general use on occasions of joyous celebrations, the *Te Deum* forms part of the daily matins of the Roman breviary, and is recited at the end of matins on all festivals, and on all Sundays except those of Advent and Lent. With a similar exception, it forms part of the morning prayer of the Anglican Prayer Book, being sung after the first lesson. Its use dates from the sixth century. Consult John Wordsworth, *The Te Deum: Its Structure* (2d ed., London, 1903), and Julian, *Dictionary of Hymnology*, new edition (ib., 1907).

TEES, tēz. A river of north England. It rises on Cross Fell, Cumberland, and flows east between the counties of Durham and York. It enters the North Sea 10 miles below Stockton, to which town it is navigable for small vessels. Length, 80 miles (Map: England, E 2).

TEE TEE. See TITI MONKEY.

TEETH (AS. *tāþ*, Ger. *Zahn*, tooth; connected with Bret., Welsh *dant*, Lat. *dens*, Skt. *danta*, tooth). Calcareous organs embedded in

the skin within or near the mouth in most vertebrates, acting primarily for the prehension and trituration of food. Some teeth, such as the tusks of the wild boar or of the elephant, have secondarily acquired another function, viz., that of offensive and defensive organs, especially with reference to combats between rival males.

Teeth are dermal structures, homologous with the placoid scales or denticles which cover the entire body of fishes (q.v.). At the anterior end, say of the body of a dogfish, the skin turns in to form the lining or mucous membrane of the mouth and with it the scales are carried. In fishes these dermal denticles appear in the skin very early both in their ontogenetic and phylogenetic history, but do not occur in *Amphioxus* or in cyclostomes. They first appear in selachians in the form of small denticles or spines arranged in longitudinal and transverse rows, each attached to a basal plate, and directed caudad. Both ectoderm and mesoderm take part in the formation of these dermal denticles, as in the case of the teeth of the higher vertebrates. The name "tooth germ" is given to the tissue that is destined to develop into the teeth. The mesoderm forms a papilla which secretes dentine in its outermost layer. Within the dentine there is a cavity filled with mesodermal tissue and blood vessels. From this cavity fine tubules pass into the dentine. Outside the dentine is a layer of enamel secreted by ectodermal cells. The first impulse towards tooth formation seems to reside in the derma. As the dermal papilla grows it comes to be covered by a layer of large columnar cells from the epidermis. The enamel is secreted from the lower surface of these epidermal cells. As the dermal cells multiply they give rise to an elongated papilla which projects backward. The deep-lying connective-tissue layers of the derma at the same time secrete salts of lime and thus a sort of connective-tissue bone (the so-called tooth cement) is produced, and by means of it the spine gains a firm support. The basal plates of tooth cement form a shield of considerable protective value, and in some fishes, such as the bony ganoids, a hard protective skeleton is thus produced. In the higher vertebrates this bony covering is lost over most of the body, but persists in the head region, and becomes some of the most important bones of the skull.

In fishes the teeth are usually abundant, and are either spiny or blunt, and may be set close together like a cobblestone pavement (see CESTRACIONT) to fit them for grinding up shells. In the swordfish they form the teeth of the sword. Amphibians possess few teeth. They are conical, end in a single or double apex, and are usually present on the premaxilla, maxilla, mandible, vomer, and palatine bones, and occasionally on the parasphenoid. They occur in additional locations in the larvæ of some forms. Teeth are present in all groups of reptiles except the *Chelonina*, and even there exist for a time in the embryonic stage of *Trionyx*, showing that the toothless state has been secondarily acquired by the turtles. The reptilian teeth are usually larger and stronger, and are limited to more special regions, than among lower vertebrates. The teeth of reptiles, as well as those of fishes, are in general homodont, or alike throughout the series. In reptiles the teeth are connected with their support in two ways: either the teeth are firmly fused to the bone or

else they lie in cup-shaped sockets of the bone, the alveoli. This condition exists in the so-called thecodont reptiles. The teeth, which are fused to the bone, may either lie in a furrow at the inner side of the jawbone (pleurodont type) or else they arise from its free upper edge (in the case of the lower jaw), and are acrodont. In many kinds of snakes certain of the maxillary teeth of the upper jaw are differentiated into organs of offense and defense. These are the fangs or poison-carrying teeth. (See SNAKE.) Birds have no teeth. Fossil birds (see BIRD, FOSSIL), however, possessed teeth, which were either embedded in grooves (*Hesperornis*) or in definite alveoli (*Ichthyornis*).

The dentition of mammals is highly variable, and the differentiation of the teeth in the various forms is to be explained by adaptation to the character of the food. All the teeth are embedded in alveoli of the jawbones, to which the growth of teeth is confined. The teeth are so arranged that those of the upper and lower jaws alternate. The teeth of one jaw oppose the interspaces between the teeth of the other jaw. Thus each tooth presses against a portion of two teeth of the opposite set. When all opposing pressure fails the tooth thus rendered functionless tends to be extruded. This alternating arrangement prevents the loss of one tooth from greatly affecting the teeth of the opposite set. Most mammals are diphyodont—i.e., possess two sets of dentition—viz., the deciduous or milk dentition and the permanent teeth. In most of the fishes as well as in many of the *Amphibia* and reptiles the teeth can be renewed indefinitely. A few mammals, viz., the *Cetacea* and *Edentata*, are monophyodont, i.e., possess only one set of teeth. The milk teeth are supplanted by a process of absorption which goes on in certain cases to such an extent that the root is practically removed. This removal is effected by giant cells analogous to, if not identical with, the osteoclasts that tear down bone. The teeth usually cease to grow after being fully formed, but in edentates and rodents growth continues throughout life, and is necessary in order to supply the wear on the teeth brought about by the gnawing habits of these animals.

Mammalian teeth are classified according to their shape and function into incisors, canines, premolars, and molars. The four front teeth in the case of man are blunt, flattened, and chisel-shaped, and are fitted for cutting or dividing the food. They are the incisors. In recently cut incisors the cutting edge is raised in three scallops, which soon wear away. The edge of the incisor is formed by a beveling off of the dentine on the inner or lingual surface. The two central upper incisors in man are slightly larger than the two laterals. This difference is more marked in anthropoid apes. The lower central incisors are narrower than those of the upper jaw. The lower lateral incisors are larger than the lower central pair. The two canines or eyeteeth on each jaw are stronger both in root and crown than the incisors. The crown is blunt and pointed. The canines are succeeded by two premolars or bicuspid on each side of the jaw, which correspond to the three and four premolars of the typical mammalian dentition. Their crowns possess two cusps. The root is normally single, but is often grooved or cleft by a longitudinal furrow into two or even three roots. The premolars of the lower jaw are smaller than those of the upper. The molars are three in

number on each side of the jaw. The form of the first molar is the most constant. The roots are three in number. The third molar, or wisdom tooth, is the most variable as to its time of appearance; it may be cut almost as soon as the other molars, or many years later, or not at all.

In existing mammals there is a certain degree of gradation between the forms of the teeth. The typical number of mammalian teeth is 44. The human number is 32 in the permanent set and 20 in the milk set. In the human set the third incisor and the first two premolars of the typical mammalian set are absent, hence at the canines in man there is an abrupt change both in front and behind. For convenience and brevity the number and kinds of teeth of mammals are usually designated by means of a formula as follows:

For marsupials:

$$i \frac{3}{2} c \frac{1}{1} pm \frac{3}{2} m \frac{4}{4} = 44.$$

For eutherian mammals:

$$i \frac{3}{2} c \frac{1}{1} pm \frac{4}{4} m \frac{3}{3} = 44.$$

For man:

$$i \frac{2}{2} c \frac{1}{1} pm \frac{2}{2} m \frac{3}{3} = 32.$$

See cut in CHILD, DEVELOPMENT OF.

It is often very difficult to determine which teeth are to be accounted incisors, canines, etc., and the following rule is sometimes employed:

Incisors, upper jaw, on premaxilla.

Incisors, lower jaw, correspond to upper.

Canines of upper jaw, next tooth immediately behind suture of maxilla and premaxilla.

Canines of lower jaw, close in front of upper canine.

Premolars replace milk molars.

Molars, behind milk molars (when present).

A tooth is usually described as consisting of three parts—the crown, neck, and root—and is composed of three hard secretions—the dentine, enamel, and cement—and a central pulp cavity. The human tooth fits into the jawbone much like a peg into its socket. This manner of union is termed gomphosis. The tooth does not, however, occupy the entire socket, for there is besides a lining of periosteum, which at the root turns upward around the tooth as far as the neck, where it becomes continuous with the gums. This packing around the tooth is somewhat elastic and allows of slight motion. The elasticity of the packing doubtless diminishes the shock which would be caused in mastication were the teeth rigidly attached in their bony sockets. When the periosteum is inflamed the swelling pushes the tooth outward in the socket and loosens it. The dentine forms the great mass of the tooth, surrounds the pulp cavity, and is covered, in the human tooth, by a layer of enamel, the hardest of animal tissues; in other mammals this layer of enamel may cover all or only a part of the exposed portion of the tooth or may be absent. The condition that more commonly prevails is that the enamel envelops the entire crown of the tooth and stops rather abruptly at about the level of the gum.

In its finer structure dentine is in some cases difficult to distinguish from true bone. Typical dentine, such as exists in human teeth, differs from bone both in structure and in chemical composition, and is known as hard or unvascular dentine. It is hard, elastic substance with a yellowish-white hue, which is made up of a number of minute, wavy, branching tubules, parallel to one another and opening internally

into the pulp cavity. These tubuli contain finely cylindrical prolongations (dental fibres) from cells in the pulp cavity, intimately connected with the nerves of the pulp. The different kinds of dentine have been classified as (1) hard or unvascular dentine; (2) plicidentine; (3) vasodentine; (4) osteodentine. The unvascular dentine has been described above. In the second class the pulp cavity is irregular in outline, with many tubes and canals traversing the dentine in various directions, some carrying blood vessels. Such a condition obtains in many of the lower vertebrates and in some mammals. The osteodentine closely approaches bone in structure. In it pulp and calcified tissue are mixed up, for there is no distinct pulp cavity. Such dentine is found in the teeth of many sharks.

The cement forms a coating over the roots of the teeth and when unusually thick may even unite the roots of contiguous teeth. In the human teeth it extends upward to cover the edge of the enamel. It covers, at first, the entire teeth of certain vertebrates, such as the elephant, and covers the crowns of the teeth of ruminants. It is derived from the tooth follicle and is closely allied to bone.

The cavity of the tooth is filled with the tooth pulp, which is composed of a gelatinous matrix and contains cells, nerves, and blood vessels. The outermost cells, known as odontoblasts, form a layer next the bone. These cells are connected by processes with one another and with deeper-lying cells, and on the periphery the processes extend into the dental tubuli.

The gums are continuous with the mucous membrane of the mouth, but are much thickened. Within the gums are tendinous fasciculi, and others extend up into them from the periosteum. These give the gums hardness. They are richly supplied with blood vessels, but have few nerves. The gums are continuous with the periosteum of the alveoli, a connective tissue richly supplied with blood vessels and nerves.

TEETHING. See CHILD, DEVELOPMENT AND GROWTH OF; TEETH.

TEFFIN, CHARLES. See ARMAND.

TEFFT, BENJAMIN FRANKLIN (1813-85). An American Methodist Episcopal clergyman. He was born near Utica, N. Y., and graduated at Wesleyan University in 1835. He served as professor of Greek and Hebrew languages and literature in Indiana Asbury (now De Pauw) University from 1843 to 1846; as editor of the *Ladies' Repository*, Cincinnati, Ohio (1846-50); and as president of Genesee College, Lima, N. Y. (1851-54). In 1862 he became United States Consul at Stockholm and acting Minister to Sweden and later was commissioner of immigration from the north of Europe for the State of Maine. From 1873 to 1878 he edited, at Bangor,

Me., the Northern Border. He wrote: *The Shoul-der Knot* (1850); *Hungary and Kossuth* (1851); *Webster and his Masterpieces* (1854); *Methodism Successful* (1860); *The Present Crisis* (1861); *Evolution and Christianity* (1885).

TEGEEA (Lat., from Gk. Τεγέα). An ancient city of southeastern Arcadia (q.v.). Its territory included the southern part of the great eastern plain of Arcadia, of which the northern part was occupied by Mantinea (q.v.). It appears to have included the modern villages of Hagios Sostis, Palæo-Episkopi, Piali, and Ibrahim Effendi, south of Tripolitza, though but few remains are visible, partly because of a deep deposit of alluvium, and partly from the destruction due to the later inhabitants. The most important ruins are those of the great temple of Athena Alea, built by Scopas (q.v.), excavated first in 1879, and later, in 1902 et seq., by the French School at Athens. The dimensions of the temple (about 163 × 70 feet) and important fragments of its sculptures were determined by Milchhöfer in 1879. The city was celebrated in the heroic legends, and for a long time seems to have opposed Sparta on equal terms, but during the sixth century B.C. was forced to join the Spartan League. At Thermopylae there were 500 Tegeans, and at Platæa 3000, of whom one-half were hoplites. Later they were again involved in war with Sparta, and after two defeats remained true allies until the invasion of Epaminondas (370 B.C.), when a democratic government replaced the aristocracy, and the city joined in the foundation of Megalopolis (q.v.). Later we find Tegea in the Aetolian League, in alliance with Sparta, forced into the Achæan League, at war with Sparta, and sharing in the confused politics which mark the history of the lesser Peloponnesian cities during the third and second centuries. A good account of the place was given by Pausanias (q.v.) in the second century of our era. It seems to have been one of the most flourishing towns of Arcadia till it was sacked by Alaric (q.v.). Consult, besides the larger works on the Peloponnesus (q.v.) by Dodwell, Leake, Curtius, and others, Schwedler, *De Rebus Tegeaticis* (Leipzig, 1889); *Ἱστορία τῆς Τεγέας*, a publication of the Tegeatic Syndesmos (Athens, 1896); and the article "Tegea" in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914). For the fragments of sculpture found at Tegea, see E. A. Gardner, *A Handbook of Greek Sculpture* (2d ed., London, 1915). See TELEPHUS.

TEGERNSEE, tã'gẽrn-zã'. A village in Upper Bavaria, charmingly situated on the lake of the same name, with an imposing castle, formerly a Benedictine abbey, founded in 719 and suppressed in 1804. The beautiful walks in the environs attract numerous visitors in the summer. A favorite point is the Grosse Parapluie, 2680 feet high and affording an admirable view of the lake and the encircling mountains. The ophthalmic clinic established by the late Duke Karl Theodor of Bavaria is still much frequented.

TEGETMEIER, tẽg'ẽt-mf'ẽr, WILLIAM B. (1816-1912). An English naturalist and author, born at Colnbrook, Buckinghamshire. He was educated at University College, London, and for a time studied medicine, but turned his attention to natural history, and became a coworker with Darwin in experiments and observations on the question of variation (q.v.) and other scientific problems. To these he contributed mainly by study of domestic animals and especially of

pigeons, and was instrumental in advancing the breeding and improvement of carrier pigeons and of fine poultry. He also coöperated with Eleanor A. Ormerod (q.v.) in lessening the destructive influence of the English sparrow. In 1857 he became a leading editor and essayist of *The Field* (of London), with which he was connected for 50 years. He wrote: *The Poultry Book* (1870); *The Homing Pigeon* (1872); *Natural History of the Cranes* (1881); *Pallas's Sand Grouse* (1888); *Table and Market Poultry* (1895); *Horses, Zebras, and Mule Breeding* (1895), with C. L. Sutherland; *The House Sparrow* (1899); *Pheasants* (5th ed., 1910).

TEGETTHOFF, tã'gẽt-hõf, WILHELM, BARON (1827-71). An Austrian admiral, born at Marburg, in Styria. He entered the Austrian navy, distinguished himself in the naval encounter with the Danes off Helgoland in 1864, became rear admiral, and in the war of 1866 commanded the Austrian fleet in the Adriatic. On the 20th of July he attacked and defeated the Italian fleet under Admiral Persano off the island of Lissa, although the Italian fleet was superior in number of ironclads to the Austrian. For this victory Tegetthoff was promoted vice admiral. In 1867 he was sent to Mexico to obtain from the government the body of the Emperor Maximilian, and in 1868 he was made commander in chief of the navy.

TEGNÉR, tẽng-nãr', ESAIAS (1782-1846). A Swedish poet and bishop, born at Kyrkerud, in Vermland. Tegnér graduated from the University of Lund (1802) and in 1805 became librarian of the university and lecturer on æsthetics. In 1811 his poem on Sweden (*Svea*) won him universal admiration and an academic prize. Already his war songs and national odes had attracted the attention of the King and government. In 1812 he was made professor of Greek at Lund, and for the next decade gave himself almost wholly to clerical duties and theological studies. During these years he wrote the remarkable religious idylls, *The Pastor's Consecration* and *The Children of the Lord's Supper* (*Nattvardsbarnen*, 1820), as well as the fine romantic poem *Åzel* (1822). His fame rests on the *Frithjof's Saga*, finished in 1825, the most popular poem in Swedish, though it lacks originality and unity, adhering closely to the legend on which it is founded and being less an epic than a series of ballads and odes. Even while unfinished it had sufficed to secure for Tegnér the nomination of the clergy to the bishopric of Vexjö (1824). In 1840 the insanity that afflicted his family unmistakably asserted itself. After a period in an asylum he returned for a while to active work, but soon became paralytic and so lingered till death. Thus it appears that Tegnér's significant production is confined to the years 1811-25. *Frithjof* has been rendered into almost all European languages and 19 times into English, best by Longfellow, who also translated *Nattvardsbarnen*. It was effective in banishing classical French taste from Sweden and in introducing the literary ideals of the Romantic school, though Tegnér always kept the clearness and artistic finish that go with calm objectivity. His verse is melodious, graceful, dignified, yet fresh, vigorous, and not without national or religious enthusiasm. See SWEDISH LANGUAGE AND LITERATURE.

Tegnér's *Works* were collected in seven volumes (Stockholm, 1847-51). Three volumes of supplementary writings were printed (ib., 1873-

74), and a jubilee edition was issued in seven volumes (ib., 1882-85). The more important poems are in English, French, and German translations. A *Life* by Böttiger is prefixed to the first collected edition of the *Works*. Consult also: H. L. A. Kippenberg, *Esias Tegnér* (Leipzig, 1884); H. H. Boyesen, *Essays on Scandinavian Literature* (New York, 1895); Georg Brandes, *Eminent Authors of the Nineteenth Century*, English translation by R. B. Anderson (ib., 1896); Erdmann, *Esaias Tegnér* (Stockholm, 1896).

TEGUAN, tē-gwān', or **TAGUAN**. One of the local names of a flying phalanger of New South Wales (*Petaurista volans*), which is black and about the size of the large Indian flying squirrels. It resembles the other flying phalangers (q.v.) in the possession of an effective parachute, and in its habits.

TEGUCIGALPA, tā'gūō-sē-gāl'pā. The capital of Honduras, Central America, on the left bank of the upper course of the Choluteca, 78 miles from its seaport, Amapala, on the Gulf of Fonseca (Map: Central America, D 3). It has a healthful location on a table-land 3250 feet above sea level, in a thickly populated portion of the republic. The region is agricultural, and has mines of gold and silver and marble, though the latter have lost their former importance. Its cathedral is the most important structure of the republic. There are a national university and a ladies' seminary. Tegucigalpa was an Aztec city and a place of some importance during the eighteenth century. It became the capital of Honduras in 1880. Pop. (est.), 22,923.

TEHAPHNEHES. See **TAHPANHES**.

TEHERAN, or **TEHRAN**, tē-h'rān'. The capital of Persia and of the Province of Teheran, 70 miles south of the Caspian Sea, on a sandy and stony plateau 90 by 40 miles in extent (Map: Persia, D 5). Its elevation is 3800 feet. In 1869 the Shah caused the mud walls of the city to be torn down and five years later it was surrounded by a ditch and 58 unequal bastions, after the first system of Vauban. It is now in the form of an irregular octagon; the perimeter measures a little over 12 miles, incloses an area of 7½ square miles, and has 12 gates. Several broad, handsome boulevards have been laid out, and are lighted by gas, and a beginning has been made in the Western style of architecture, especially in the northern part of the city. The sanitary conditions have likewise become improved. There are 7 miles of tramways, and a railway (opened in 1888) to Shah-Abdul-Azim, 6 miles south of the capital. The Ark, or fortified palace of the Shah, in the middle of the city, contains prisons, a military school, beautiful gardens, baths, kiosks, and several other handsome buildings, including the harem. The wealthy citizens dwell in elaborate establishments with gardens and tiny ponds. South of the Ark are the bazars, the centre of the city's life. The town has a library, founded in 1850, a normal school, a military college, and Kings' College, a polytechnic school (1849), with European professors, where Arabic, English, French, and Russian, mathematics, telegraphy, engineering, military tactics, music, and painting are taught. To some of the many mosques are attached mad-rassehs (colleges). The mosques called Masjid-Shad (mosque of the King), with a beautiful named façade, the Masjid-i-Madar-i-Shah (mosque of the King's mother), and the Masjid-Sipahsalar deserve mention; all of them are

modern. There are many baths, Mohammedan and Armenian, the Europeans using the latter. During the summer, on account of unhealthfulness and intolerable heat, the embassies and the wealthier inhabitants move to the mountain slopes.

Water is furnished by underground canals from the mountains. The supply, though abundant, is not regulated, because of private ownership of many canals, and the city accordingly suffers from a lack of water in summer and a superfluity in winter. Irrigation is thus provided, however, and the surrounding country has become highly productive. Teheran manufactures cotton, linen, carpets, shoes, hats, and iron-work, but is not a leading centre of manufacturing. It has, however, an important general caravan trade. An excellent highway 217 miles long, constructed by Russian capital, and completed in 1899, extends from Resht on the Caspian to Teheran. The latter is also connected by carriage road with Kom, 91 miles. To the south of the city lie the ruins of Rei, the birthplace of Harun al Rashid, known in the time of Alexander the Great as Ragæ, the Rhages of Scripture, the capital of Parthia. The population is greatest in winter, when it probably reaches about 280,000, including about 4000 Jews, 4000 Armenians, 600 Europeans, and a garrison of 3000 to 4000.

TEHRI, tā'rē, or, more properly, **GARHWAL**. A native state of British India included territorially in the United Provinces of Agra and Oudh (Map: India, D 2). It borders upon Tibet, and lies wholly within the Himalaya, around the sources of the Ganges, being a highly elevated and rugged mountain region. Area, 4180 square miles. Pop., 1901, 268,885; 1911, 300,819. Capital, Tehri.

TEHUANTEPEC, tā-wān'tā-pēk', **ISTHMUS** OF. The narrowest portion of Mexico as well as of the American continent north of Costa Rica (Map: Mexico, M 10). It stretches in an east and west direction between the Gulf of Campeachy, an arm of the Gulf of Mexico west of Yucatan, on the north, and the Gulf of Tehuantepec, an arm of the Pacific Ocean, on the south. Its least width, from Coatzacoalcas to the head of the Lago Superior, is 120 miles. The plateaus of Mexico and Guatemala are here separated by a depression falling to an altitude of 680 feet. This fact as well as the geographical position of the isthmus has led to numerous plans and projects for some means of interoceanic communication at this point, including a possible scheme for a ship canal. A railroad of standard gauge and 150 miles long was built across the isthmus by an English firm and was opened in 1907. It is operated under a partnership between the Mexican government and the constructing company. Its terminal ports are Puerto Mexico (Coatzacoalcas) on the Gulf and Salina Cruz on the Pacific.

TEHUELCHÉ, tā-wēl'chā. A general term for several different Patagonian tribes. There is evidence that the Tehuelches are immigrants from more northern portions of South America, but their origin is doubtful. They occupy a relatively small territory between the Strait of Magellan and the Santa Cruz River. They are considered the tallest of human races. Accurate observations on this point are few, but the average stature of male Tehuelches is about 1.75 m. They are also very brachycephalic in head form. In culture they are low. Consult Masters, *At Home*

with the Patagonians (London, 1871), and Lista, *Viage al pais de Tehuelches* (Buenos Aires, 1878).

TEIAS. See TEJA.

TEICHNER, HEINRICH DER. See HEINRICH DER TEICHNER.

TEIGNMOUTH, tîn'mûth. A seaport and watering place on the south coast of Devonshire, England, situated on the English Channel, at the mouth of the Teign, 15 miles south of Exeter (Map: England, C 6). There is a considerable sea and river fishery. An average of 1200 small vessels clear the port annually. The town received a market grant from Henry III. It was burnt by the Danes in 970 and by the French in 1340 and 1690. Pop., 1901, 8636; 1911, 9215.

TEIGNMOUTH, JOHN SHORE, first BARON (1751-1834). An Anglo-Indian statesman. He was born in London, was educated at Harrow, and in 1769 entered the civil service of the East India Company. From 1775 to 1780 he was a member of the revenue council at Calcutta, and was appointed by Warren Hastings one of the committee of revenue which superseded the council. After a visit to England in 1785-86 he returned to India in 1787 as a member of the supreme council of Bengal. The organization of the revenue and judicial systems of Bengal and the measure on *Zamindari* proprietorship of the soil which was ratified by Lord Cornwallis were largely due to Shore's initiative, and on Cornwallis' retirement in 1793 Shore was made Governor-General of India. He was created a baronet in 1792. On his retirement in 1798 he was raised to the peerage as Baron Teignmouth. He wrote *Memoirs of the Life, Writings, and Correspondence of Sir William Jones* (1804). Consult C. J. S. Teignmouth, *Life and Correspondence of John Shore, first Baron Teignmouth* (2 vols., London, 1843).

TEISSEIDRE, FRANÇOIS LOUIS. See FLEURY, MARQUIS DE.

TEISSERENC DE BORT, tâ's-rân' de bôr', LÉON (1855-1913). A French meteorologist, born at Paris. He was in the government service from 1882 to 1890, when he resigned to do experimental work. He fitted out the *Otarie*, which made fruitful cruises in the Mediterranean and the tropical Atlantic. At the meteorological observatory which he established at Trappes (Seine et Oise), many important discoveries in aërology were made. His work was several times crowned by the Academy of Sciences, to which he was elected in 1910. Most of his writings appeared in the *Annales du bureau central météorologique*, but he published, besides, *Distribution de nébulosité à la surface du globe* (1884); *Etude de la synthèse sur la répartition des pressions à la surface du globe* (1887); *Mesure des hauteurs des nuages par la photographie* (1895); *Etude de l'atmosphère marine par sondages aériens* (1909).

TEIXEIRA DE MATTOS, tâ-shā'râ dâ mât'tôs, ALEXANDER LOUIS (1865-). An English journalist, born at Amsterdam. In 1874 he settled in England, and later was London correspondent for Dutch newspapers. He served as editor of *Dramatic Opinions* in 1891, and as assistant editor and editor of the *Candid Friend* in 1901-02. He became widely known for his translations from the Danish, Dutch, Flemish, French, and German, and especially for those of Maurice Maeterlinck, Carl Ewald, Maurice Leblanc, and J. H. C. Fabre (qq.v.).

TEJA, or TEIAS. The last King of the

Ostrogoths. He was chosen King after the death of Totila (q.v.), who fell in battle against the Byzantines under Narses, at Tadino, 552 A.D. The Gothic Kingdom received its deathblow in that battle and it was left to Teja only to prolong the hopeless struggle. He sought to gain the aid of the Frankish King Theudebald, but failed. While marching to the relief of Cumæ he was met by the Imperial army under Narses and thereupon took up an impregnable position near the foot of Mount Vesuvius, where the Goths were invested by the enemy. After two months want of food compelled the Goths to abandon their position and they retired to the Lactavan Hill, whence they made a desperate onslaught on the Romans. In the two days' battle Teja perished after performing wonderful deeds of valor (553). The remnant of the Goths were permitted to leave Italy. Consult *Cambridge Medieval History*, vol. ii (New York, 1913). See GOTHs.

TEJADA, tâ-hâ'dâ, LERDO DE. See LERDO DE TEJADA.

TEJEND (tēj'ënd) RIVER. See HERI-RUD.

TEJON, tâ-hôn'. The Mexican name of the local species of badger (q.v.).

TEJU, tē-yō' (abbreviation of *Tejuguacu*, the native name). A large and powerful South American lizard of the family Tejidae, and especially of its principal genus, *Tupinambis*. This family comprises nearly 40 genera with more than 100 species, and exhibits great diversity, from its wide range, covering all South and Central America, the West Indies, Mexico, and the southwestern United States. The largest of the family (*Tupinambis teguexin*) is 3 feet long to the end of its long, terete, tapering tail; is bluish black with irregular yellow crossbands, and reddish yellow underneath. They frequent woodlands and plantations, living in burrows. They are carnivorous and are able by swiftness and agility to capture small animals.

TEKELI, tēk'ē-lī. An Hungarian patriot. See TÖKÖLY.

TEKIYÉ, tâ-kē'ye. A Mohammedan monastery inhabited by dervishes (q.v.) or other ascetics. The larger tekiyé are built about an arcaded court, beyond which are the chambers, sometimes covered with domes; the smaller examples are often mere ordinary houses. Well-known examples are the tekiyé of the whirling dervishes at Pera, that of the howling dervishes at Scutari (Constantinople), and the one built near Damascus by Sultan Selim I in 1516.

TEKNONYMY (from Gk. τέκνον, *teknon*, child + ὄνυμα, *onyma*, ὄνομα, *onoma*, name). A custom found among certain savage groups whereby a father (in some cases both parents) after the birth of a child is known as the parent of so-and-so. The custom is seen most completely developed in Java, Sumatra, Borneo, Celebes, and the neighboring islands. It is also found among Arabs and Persians, in Alaska, among the Cree, Hopi, and Zuñi of North America, in Oceania, Australia, and South Africa. The more commonly accepted explanation of the custom is that the assumption by the father of his child's name is an assertion on his part of his fatherhood and is indicative of the growth of the patriarchal idea. Another view is that it is the result of migration, the children of immigrants who have intermarried with older resident populations, forming a natural bond between the two distinct races, wherefore the strange names of their fathers would be supplemented

by expressions simply designating them as the parents of their offspring. The probabilities are that a number of customs of diverse origin are included under the term. Consult E. B. Tylor, in *Journal of the Anthropological Institute*, vol. xviii (London, 1889), and W. H. R. Rivers, *The History of Melanesian Society*, vol. i (Cambridge, 1915).

TEKUTCHIU, tã-koo'chê. A town of Rumania. See TECUCIU.

TEL'AMON (Lat., from Gk. Τελαμών). In Greek mythology, the son of Æacus. Having been driven out of Ægina (q.v.) for helping Peleus (q.v.) to kill their half brother Phocus, he married Glaucê, daughter of the King of Salamis, and became King of the island. He was the father of Ajax the Greater (see AJAX), took part in the hunt of the Calydonian Boar (q.v.) and the Argonautic expedition (see ARGONAUTS), and went with Hercules (q.v.) against Troy and the Amazons.

In architecture the term is, for some obscure reason, often applied to male human sculptured figures supporting entablatures, balconies, or the like, more often and more properly called atlantes. See ATLAS.

TELANG, tẽ-lãng', or **TELANGA**, tẽ-lãn'gã, KASHINATH TRIMBAK (1850-93). A Hindu judge. He was born and educated at Bombay. In 1872 he was enrolled as a barrister. In 1881 he became a syndic of the University of Bombay, and in 1889 was appointed to a seat on the high-court bench. In 1892 he became vice chancellor of the university and president of the Bombay branch of the Royal Asiatic Society. Among his works may be mentioned the translation into English prose and verse of the *Bhagavad-Gita* (q.v.) in the "Sacred Books of the East," vol. viii (1898), and a criticism of Weber's theory that the *Ramayana* (q.v.) showed Homeric influence. He edited the *Niti- and Vairãgya-çatanas* (1874) of Bhartrihari (q.v.), and the *Mudrãrãkṣasa* (1884) of Viśakhadatta (q.v.). He also translated into Marathi (q.v.), his native dialect, Lessing's *Nathan the Wise* and an essay on *Social Compromise*.

TELAUTOGRAPH (from Gk. τῆλε, *têle*, afar + αὐτός, *autos*, self + γράφειν, *graphein*, to write). An autographic writing telegraph invented by Elisha Gray. This system comprises a transmitter, receiver, and circuit con-

The transmitted current from each rheostat varies with the position of its respective roller, such position shifting with motion of the sending pencil. These varying currents are led by circuits to coils, CC, at the receiving instrument; these are wound on copper bobbins and suspended in strong uniform magnetic fields. As the transmitted current varies in size owing to shifting of the pencil at the transmitting station, the coils shift their positions. The pen, P', of the receiver is attached to the arms of crank levers, which are in frictional contact with the supports of coils, CC. Thus, as the coils shift position owing to the change of current in them, the resulting motion of the pen corresponds to that of the sending pencil and the handwriting of the operator is reproduced. This device is quite extensively employed in banking houses, department stores, clubs, and government offices for the transmission of orders or instructions from one department to another.

TELAV, tyẽ-lãf'. An old district town in the Government of Tiflis, Russian Transcaucasia, 63 miles east-northeast of Tiflis (Map: Russia, G 6). It was formerly the capital of Kachetia and has ruins of old palaces. Pop., 1910, 15,231, chiefly Armenians and Georgians.

TELEDU, tẽl'ẽ-doo. See BADGER.

TELEGONUS (Lat., from Gk. Τηλέγονος). The son of Ulysses (q.v.) by Circe (q.v.). Having been sent to Ithaca to find his father, he failed to recognize him in combat and slew him, afterward taking the body home, together with Telemachus (q.v.) and Penelope (q.v.), whom he married. He was looked upon as the founder of the Italian cities Tusculum (q.v.) and Præneste (q.v.), and, through his daughter Mamillia, as the ancestor of the Roman Mamillii. His story is the theme of the *Telegonia* or *Telegony*. See CYCLIC POETS; TROJAN WAR.

TELEGONY (from Gk. τῆλε, *têle*, afar + γονία, *-gonia*, generation, from γόνος, *gonos*, seed, from γίγνεσθαι, *gignesthai*, to become, to be born). The influence of the first or of a previous sire on the subsequent progeny obtained by other sires. That the first impregnation has a lasting influence has been generally accepted by breeders. Weissmann, however, states that the most competent judges in Germany, such as Stettgast, Nathusius, and Kühn, in spite of their extensive experience in breeding and cross-

ing, have never known a case of telegony, and doubt its reality. See BREEDING.

TEL'EGRAPH

(from Gk. τῆλε, *têle*, afar + γράφειν, *graphein*, to write). Strictly defined the word "telegraph" means to write at a distance, though to-day the word is employed to designate

nections. A typical station equipment is shown in the illustration. Two wires are employed to connect transmitting and receiving stations. The operating mechanisms and simple circuit connections, not inclusive of the announcing buzzer and inking details, are shown in the diagram. At the transmitter, the pencil P is attached by lever, *ll*, to two circuit contact rollers, *rr*, which bear against the surface of two inversely placed horn-shaped rheostats.

any means whereby a message is transmitted by signs or sounds other than the spoken word. Thus, generally speaking, the smoke and flame signaling used since biblical times (Ex. xiii. 21), heliographs, semaphores, etc., would be considered telegraphing. However, these devices, discussed under SIGNALING AND TELEGRAPHING, MILITARY, will not be treated in the present article, which deals with the electric telegraph.

History. The earliest reference to the use of

electricity for the sending of signals is found in an article in the *Scots Magazine* of February, 1753, which suggested the use of frictional electricity. In 1774 Le Sage of Switzerland constructed a telegraph system about 1 mile long, which comprised 24 line wires, one for each letter, with pith balls suspended at each terminal, utilizing the well-known phenomenon that light substances are repelled upon electrification. Through the use of frictional electricity applied at the sending end of the wires, Le Sage succeeded in transmitting intelligible signals to the receiving end. Francis Ronalds later (1815) devised an alphabetical telegraph system which also employed frictional electricity as the actuating agent. Synchronously rotating dials were placed at the sending and receiving terminals, and back of these dials the letters of the alphabet were arranged in a circle. A slot was cut in the face of each dial through which, as the dials rotated, the letters of the alphabet could be seen. Upon a certain signal the rotating mechanisms of the dials were set in motion, and as the windows exposed a desired letter the current was applied, and pith balls suspended at the terminals of a wire connecting the stations were caused to swing; in this manner the message was spelled out. In 1839 DeHerr of Holland proposed a system employing the physiological effect of the electric current. In this scheme 10 wires were employed between two stations. At the receiving end the operator placed his fingers and thumbs on the 10 terminals respectively, and with the passage of the current in a predetermined manner the shock would indicate the message sent. Telegraph systems depending upon the use of frictional electricity are, however, very uncertain on account of the great leakage of current and their extreme sensitiveness to atmospheric conditions.

Allesandro Volta (q.v.), professor of physics at Como, discovered (1774) that electricity could be generated by chemical means. Following this, several more or less successful attempts were made between 1806 and 1830 to employ the electrochemical action of the voltaic current to record messages. Dyar's recorder of 1826 employed the action of electric currents on iodine solutions as a means of recording messages.

Oersted (q.v.) of Copenhagen (1820) made the great discovery that a magnet needle would be deflected from its normal position when placed parallel to a wire conveying an electric current, and, further, that the deflection was to the right or left, depending upon the direction of current flow. Employing a coil of wire within which the magnetic needle was suspended, the effect is multiplied and a sensitive current-indicating device or galvanometer (q.v.) is produced. Following this epoch-making disclosure, many needle-telegraph systems came into existence and were at one time extensively employed in Europe, those of Gauss and Weber in Germany and of Wheatstone and Cooke in England being the most important. Sturgeon in England (1824) discovered that when a current of electricity was caused to flow in a coil of insulated wire, surrounding a bar of soft iron, the latter became a strong magnet, and that upon interruption of the current the bar immediately lost its magnetism. Joseph Henry (q.v.) of Albany, N. Y. (1831), set up the first experimental electromagnetic telegraph system, employing as elements a voltaic battery and an electromagnet. It, however, remained for Dr. Samuel

F. B. Morse (q.v.) of New York (1837) to invent the telegraph system which in one form or another is the basis of most modern land systems. The apparatus first used by Morse has but slight resemblance to the instrument used to-day. The original Morse relay weighed about 300 pounds, that employed to-day weighs about 3 pounds.

Up to about 1870 the Morse single-message systems were the only practical ones. The duplex method, the sending of two messages simultaneously in opposite directions, was not perfected until 1872 by J. B. Stearns. The duplex, used to send two messages simultaneously in one direction, was invented by Thomas A. Edison in 1873, and the quadruplex system, sending four messages in pairs of two in opposite directions simultaneously, was invented by him in 1874. To-day the duplex, quadruplex, and multiplex systems are extensively used in practice, and the field of electric telegraphy has been extended until it includes municipal fire and police alarm systems, stock-quotation tickers, typewriting and autograph telegraphs, while the submarine telegraph, as first exemplified by Cyrus W. Field's commercial cable, has been in extensive use since 1865.

Practice. The essential elements of an electric telegraph system are: (1) means for producing the electric current—the battery or the generator; (2) means for conducting the electric current—the line wires; (3) means for controlling the duration and sometimes the direction of the current—the key or transmitter; (4) means actuated by the current to indicate or record the messages—sounders, recorders, etc. Thus the art of electric telegraphy consists in the production, control, and organization of electrically actuated signals, these being either visible or audible. Visible signals may be momentary and vanishing, as in the earlier forms of mirror galvanometers, or they may be permanent, as in the case of the Morse register or siphon recorder; whereas audible signals are produced by the sounder or other similar device.

A simple electric circuit is represented in Fig. 1, wherein *W* is the conductor circuit, *B* the electric battery, *K* the transmitting key, and *R* the receiver.

Fig. 1 represents a complete metallic circuit, but since Steinheil (1838) showed that the earth is a good conductor, the dictates of economy lead to the use of an electric circuit for telegraphic purposes, one side of which comprises a copper conductor and the other, the earth, as a

FIG. 1. SIMPLE TELEGRAPH CIRCUIT.

return; i.e., a grounded circuit is used, and such a circuit is illustrated in Fig. 2, wherein *B*, *K*, *R*, and *W* have the same significance as in Fig. 1, while *G* and *G'* represent the ground plates. These are copper sheets buried well below the surface in a normally moist soil.

Types of Circuits. There are two general ways in which a telegraph circuit may be arranged. The source of electricity may only be

connected to the line when a message is to be sent or the generator may be in the line constantly with a continuous flow of the current

FIG. 2. EARTH-RETURN CIRCUIT.

along the line, the message being sent by opening the circuit and interrupting the current flow. These methods are known as the open-circuit and the closed-circuit arrangements respectively.

An open-circuit telegraph line comprising three stations is represented in Fig. 3. Each station is provided with a controlling key, *K*, a battery,

FIG. 3. OPEN-CIRCUIT TELEGRAPH.

B, and a receiver, *R*. The receiver and the battery are in different branch lines. When the key, *K*, at any station is up, the normal condition, the receiving device at the corresponding station is in the circuit. When the key is pressed down, the receiving device, sounder, or relay is cut out, and the corresponding battery is placed to the circuit; current then flows over the line wire, actuating the other receiving devices, causing their movable members, the armatures, to be drawn forward. In this arrangement, therefore, each station will transmit signals by inserting its own battery into circuit at the proper intervals, and the current flow thus established actuates the receiving devices at the other stations. This arrangement is not employed in America, but is encountered in European practice.

A closed-circuit telegraph line comprising three stations is represented in Fig. 4. In this

FIG. 4. CLOSED-CIRCUIT TELEGRAPH.

depressing the key to close the circuit at the front stop. This system has the main advantages of both the preceding arrangements. It has, however, a serious weakness of its own, viz., an operator may fail to close the circuit at *X* after completing his message. This leaves the system inoperative, just as much as though the line itself had been broken. Many automatic schemes have been suggested to remedy this, but the most effective protection has been dismissal of the individual who failed to close up the line.

A typical Morse key of the Bunnell type is shown in Fig. 6. *A* is the lever between the trunnions *TT*; the lever has a small up and down motion, limited re-

FIG. 5. AMERICAN STANDARD TELEGRAPH CIRCUIT.

arrangement a battery need not be used at every station; it may be concentrated all at one end of the line, though a better distribution is ob-

respectively by the set screw *S* at the rear and by the contact points *C* and *C'* at the front. The circuit leads go to the binding posts *PP'*. The

tained if a battery be grouped at each terminal station. The cells of the battery are always in the line, the current passing normally through the rear contacts of the keys and through the receiving instruments at all the stations. The circuit is interrupted by the depression of any of the keys, the current ceases to flow, and a signal is simultaneously given by all the receiving instruments, their levers or armatures being drawn away from the magnets by spring action.

The primary advantages of the open-circuit system are that in the case of audible messages, received with a sounder, as described below, the sound is made on the forward stop, which is clearer than that given out by the armature striking the rear stop; also less battery material is consumed because the current only flows when the message is being sent. The closed-circuit system, however, has the great advantages that the line is under constant test, the operator hears his own message, and the battery attendance is simplified, as the power plants are only at terminal stations.

The American modification of the Morse system is shown in Fig. 5. This is the standard arrangement employed in the United States, Canada, and Mexico. It differs from the closed-circuit system in that the current does not pass through the back stop or contact of the operator's key, but through lever

circuit is normally closed by the side lever *X*, making contact with the tongue attached to *C*. When the operator wishes to send a message, *X*

FIG. 6. AMERICAN TELEGRAPH KEY.

is pushed away from *C* and the circuit made by pressing down on *A* to make *C* and *C'* come into contact.

Code. The message is transmitted by the duration of time of contact between *C* and *C'*. The Morse code was devised by Alfred Vail (1837) and is made up of a combination of elements: the dot, the dash, the ordinary space, the letter space, the word space, and the sentence space. The dash is equal to two dots in duration; the ordinary space is equal to the dot in duration; the letter space is equal to two dots in duration; the word space is equal to three dots, and the sentence space is equal to five dots. The typical codes are shown herewith

FIG. 7. MORSE ALPHABETS.

(Fig. 7). The Morse code is used in America; the Continental on cable work, wireless, and in Europe and in all countries except those of North America.

Sounder. A typical sounder is shown in Fig. 8. In this the lever or armature *A* is attracted by the magnet *E* when the current flows

FIG. 8. SOUNDER.

through the winding. The motion of the armature is adjusted between the stop limits *L* and *L'* and the strength by the spring *S*. In the open

circuit and American modification the signal dot or dash is given by the point of the stop *L'* striking the frame *B* on its downward stroke. On short-line circuits 40 to 50 miles in length the sounder may be directly in the main circuit; in such cases the magnet coils of about 1800 turns have a resistance of about 20 ohms, and a current of about 0.125 ampere is needed to actuate it.

Relay and Local Circuit. When the line is of considerable length and resistance, and its

FIG. 9. RELAY.

insulation only fair, it is most difficult to maintain a current sufficiently strong to actuate a main-line sounder. This is overcome by introducing an auxiliary receiving instrument, the relay, into the main line (Fig. 9). The armature is very light, and so delicately balanced that

only a small current is required to actuate it. However, owing to the lightness it does not give out a clear sound, hence it is employed to open and close a local circuit in which the sounder is located. The line current needed to actuate such a relay is about 0.02 ampere; the local circuit contains one or two cells, the local sounder and connections; while the current in the local circuit to actuate the sounder is about 0.25 ampere.

Way Station. The simplest combination of apparatus is that employed at an intermediate or way station of a single-line circuit. It comprises a key, relay, local battery, sounder, lightning arresters, protector fuses, and the various connecting wires. The arrangement of the apparatus is represented in Fig. 10.

Telegraph Line. Telegraph lines while originally of iron wire, are now generally of copper, varying from 0.1" diameter (No. 10 B. and S. gauge) to 0.14" in diameter (No. 7 B. and S. gauge). The line wires are carried on wooden poles, spaced about 20 to 40 per mile, depending upon the nature of the country. At each point of support the line wires are attached by a loop to an insulator on a cross arm. The function of

the insulator, usually of glass in the United States and earthenware or porcelain in other lands, is to prevent, in so far as possible, the

FIG. 10. SINGLE-LINE WAY STATION SHOWING RELAY.

leakage of current to the ground. A typical telegraph line insulator is shown in Fig. 11.

The length of a continuous telegraph circuit

FIG. 11. TYPICAL AMERICAN GLASS INSULATOR.

which may be operated satisfactorily depends upon the resistance of the line, the effectiveness of the line insulation, the weather conditions, the

effective insulation necessitate shortening the line. The greater the continuous length of the line, the slower the speed with which the message can be sent. Thus it has become the practice to divide long telegraph lines into sections of 300 to 500 miles, repeating the message from one section to the next. This was formerly done by an operator but is now performed by a device or instrument called the repeater.

Repeater. Repeaters are simply combinations of electromagnetic devices in which the relay receiving signals through one section opens and closes the circuit of the next section in the manner that a relay opens and closes a local circuit. The combination must, however, so function that the repeating of messages from one section of line to another may be performed in either direction. There are many forms of automatic repeaters. A very simple and effective one is the Tøye repeater (Fig. 12). This comprises two relays, R_e and R_w , two transmitters, T_e and T_w , two terminal batteries, B_e and B_w , two rheostats, S_e and S_w , various wire connections, local batteries, etc. By reference to Fig. 12 it will be seen that when the distant eastern operator opens his key to prepare to send a message to the west, the relay R_e will become demagnetized, its lever arm falls away and opens the local circuit, controlling the western transmitter T_w . As this transmitter becomes demagnetized, its armature is drawn up at the inner end by a spring and the western line is opened between the post P and the tongue t . When this occurs, if it were not for a preventive feature, the western relay at the repeater station would also become demagnetized, its lever armature would fall away, opening its local circuit containing the transmitter winding T_e , which action would in turn open the eastern line at the corresponding tongue and post, with the result that the whole line would be as inoperative as though the wires were down. In the Tøye arrangement relay R_w is prevented from opening by the fact that the western battery when not connected to the main line is given a path to earth, through S_w by way of the tongue and lip of T_w , thus holding closed the local circuit of R_w , controlling T_e . When the distant eastern operator closes his sending key to transmit a dot or dash, the relay R_e becomes magnetized, its armature is drawn forward, and the local circuit controlling T_w is closed, the western battery being placed to the western line by post P , making contact with tongue t and the current impulse of duration desired sent out along the western line. When

FIG. 12. DIAGRAM OF CIRCUIT OF TØYE REPEATER.

number of way stations through which the line loops, the mode of sending, and the speed of operation desired. The difficulties arising from de-

a distant western operator transmits east, the action of the relays and transmitters is the converse of the action described above.

Multiplex Telegraphy. Within a generation from the commercial introduction of the telegraph the multiplication of wires on the prin-

FIG. 13. DIFFERENTIAL RELAY.

cipal lines became so marked as to be seriously objectionable. To correct this difficulty and to increase the earning capacity of through lines, the multiplex systems of telegraphy were devised. The most generally useful are the duplex or contraplex, the duplex and the quadruplex.

Duplex Telegraphy. There are two systems of duplex telegraphy, viz., the differential and the bridge. The former is used in America and the latter in Europe, particularly in England; it is also to some extent employed in connection with submarine-cable working. (See TELE-

FIG. 14. STEARNS DUPLEX SYSTEM.

RAPHY, SUBMARINE.) The differential duplex makes use of the differential relay, and the principle is shown in Fig. 13. The battery current divides equally between the similar branches *C* and *D*, the two equal parts passing in opposite directions through the two windings *a* and *b* respectively; thus the core of the relay is not magnetized when the key is closed. The resistance *C* represents the line and apparatus at the distant station, and that at *D*, the artificial line, is equal in resistance and electrostatic capacity to *C*. The connections of a Stearns duplex system are shown in Fig. 14. The key at the home station actuates the relay at the distant station, while the home relay is caused to operate by the opening and closing of the sending key at the distant station. The keys employed are of the continuity type, so as to insure a constant line resistance, the battery not being removed until the resistance replaces it. A second form of differential duplex is known as the polarized duplex. This employs polarized differential relays, and instead of responding to changes in current strength these are actuated by reversal of current direction.

The principle of the bridge duplex is illustrated in Fig. 15. The four resistances *a*, *b*, *c*, and *d* constitute the four arms of a Wheatstone bridge, and no current of the home battery flows through the home relay when the local key is closed, the points *x* and *y*, across which the relay

FIG. 15. PRINCIPLE OF BRIDGE DUPLEX SYSTEM.

is placed, being of the same potential. The resistance *c* represents the line and distant-station apparatus, while *d* represents an artificial line balancing the line *c*, in all respects. An actual arrangement of the bridge duplex is illustrated in Fig. 16.

Duplex Telegraphy. This system of telegraphy depends upon the use of two forms of relays, viz., the ordinary or neutral relay, provided with a stiff spring, and a polarized relay, the armature of which responds only to reversals of current. The adjustment of the two relays is such that the neutral one requires for its actuation three to four times as much current as the polarized one. The general arrangement of a polarized relay is shown in Fig. 17. It comprises an ordinary electromagnet, with its soft iron cores mounted on one pole of a U-shaped permanent magnet and a light iron lever, *L*, pivoted at *P*. This light lever is given a definite polarity inductively by the permanent magnet. When current flows through the coils of the electromagnet, one of its poles, say *N*₁, is greatly strengthened and attracts *L*; if, however, the current is reversed, the other pole, *N*₂, is strengthened and will attract *L*. Accordingly, lever *L* is attracted towards *N*₁ or *N*₂, depending upon cur-

FIG. 16. BRIDGE DUPLEX SYSTEM ARRANGEMENT OF CIRCUIT.

rent direction, and consequently it may be used to open and close a local circuit in response to reversals of the line current. A general arrangement of the duplex circuits is shown in Fig. 18. This comprises the battery, the intensity key, *K*₁, the pole-changing key, *K*₂,

at the home station, as well as the neutral and polarized relays, *N* and *P*, at the distant station, the local sounders are not shown. The

FIG. 17. POLARIZED RELAY.

action is as follows: The neutral relay responds to increase of current strength by the intensity key, *K*₁, cutting out the added resistance, *R*₁, while the polarized relay responds to reversals of current upon manipulation of the polarity key, *K*₂. To prevent the operator from dragging his message or from holding the keys in a midway position, which would be fatal to the diplex operation, the transmitting keys are actuated by electromagnetic means. Diplex telegraphy is seldom, if ever, used per se; its usual appearance is as one of the constituent elements of the quadruplex system.

Quadruplex Telegraphy. The transmission of four messages, two each way, over one line simultaneously is the function of the quadruplex. This is accomplished by making both the neutral and polarized relays of the diplex system of the differential type and combining them in series as in the duplex system. Quadruplex circuits may be of the differential type or they may be of the bridge type. The arrangement of apparatus

FIG. 18. DIPLEX CIRCUIT.

for the differential form is illustrated in Fig. 19. In this illustration manipulation of the intensity key, *K*₁, at the home station actuates the neutral relay at the distant station, whereas movement of the home polarity key is duplicated by the action of the polarized relay at the far station.

The repeating of messages over quadruplex lines does not call for special repeating apparatus as in the case of single-message circuits. The adjacent terminal apparatus is cross connected and the intensity relay of one line actuates the polarity key of the next section, while the adjacent terminal apparatus is cross connected and the intensity relay of one line actuates the polarity key of the next section, and conversely. This transfer from polarity to intensity sides and converse is made to balance up the speed of both sides.

A system of multiplex telegraphy invented by Delany and employed in Europe provides for the simultaneous transmission of a number of messages either in the same direction or part in one direction and the remainder in the opposite direction. The apparatus consists of a number of contact pieces arranged on a circular disk or

FIG. 19. QUADRUPLEX CIRCUIT—BRIDGE TYPE.

table, some of which are connected with the separate sending or transmitting instruments, while others are connected with local relays and batteries and the ground. A trailer or rapidly revolving arm connected with the line wire passes over these contact points so that the circuit is successively completed through the different instruments at one station, while a similar device at the other station, revolving synchronously with the first, makes connections with an equal number of instruments. The speed of revolution of the trailers is regulated by two tuning forks or vibrating reeds of the same pitch, and an ingenious synchronizing device keeps them always in unison. In this way it is possible to operate 12 different sets of Morse transmissions over one wire, and it is accomplished in the following manner. The first operator closes his key, and, as the trailer passes around, it will make contact with the line wire and his instrument will be connected about 36 times in one second, thus transmitting that number of impulses. Now, if he desires to send a signal corresponding to a dot, he would close his key for a brief interval, which may be one-twelfth of a second, thus allowing three impulses of current to be transmitted over the line wire to the corresponding instrument at the other station, which is only in a position to receive the signals from the one transmitter. The same is true for the other operators and their instruments, each one employing the wire for a certain fraction of the time.

Automatic Sending and Receiving. The speed of transmission of an average telegraph operator is from 30 to 40 words per minute,

FIG. 20. PUNCHED TAPE FOR WHEATSTONE TRANSMITTER.

while the characteristics of both line and receiving apparatus allow of a much greater rapidity. To utilize these possibilities to the utmost, automatic sending and receiving equipments have been devised. One of the most effective of these is known as the Wheatstone automatic, and by

FIG. 21. PUNCH FOR TAPE.

its use a message speed of 300 to 400 words per minute may be attained. The message to be transmitted is prepared on a special tape, and this is passed through a transmitter which is a pole-changing switch. The messages are received by means of an inking polarized relay which records the same in Morse code upon a receiving tape. A dot appears on the transmitter ribbon as three vertically spaced holes; a space as one or more small holes along the central line, depending upon the space duration; and a dash is formed by four holes, two space or guide holes and two other holes, one above the first space hole and the other below the second one. A portion of perforated tape is shown in Fig. 20, with corresponding Morse code characters and letters. A tape punch or perforator is shown in Fig. 21, the punch operated by the button at the left forms the dot character, the middle one the space hole, and the right-hand one forms the four holes representing the dash. When the perforator is properly adjusted, 120 guide or centre-line holes are formed per inch of tape. These engage with the points of a star

wheel which feeds the tape forward as the characters are punched. The general arrangement of a simple Wheatstone system, though it is also operative in duplex with modifications of connections, is shown in Fig. 22. The sending mechanism is shown at the left and the receiving apparatus at the right. The perforated sending tape is moved to the left over a slotted table, by means of the spur wheel, *W*, and a guide wheel, not shown, serves to press the tape against the table. Rods *P* and *N* pass through holes in guide plate so that they are aligned with the front and back holes on the tape; their longitudinal spacing is the distance between adjacent guide holes. The walking beam, *R*, carrying these upright rods is provided with two projecting pins, *XX*, which limit the upward thrust of rods *P* and *N* as caused by the tension of spring *S*. The crank, *K*, driven by clockwork or motor, which also drives the spur wheel, *W*, rocks the beam through a small arc. The tape is moved forward one space with each down stroke of rod *P*, and the motion of the rods is transmitted to the pole-changing switch, *S*, by the bell crank. A quick snap is given to the switch blade as it passes over the centre position by the flat spring-supported roller; this is done to prevent dragging and sparking at switch contact point *Q*. When the rod *P* is at the top of its stroke, as shown in the illustration, the plus terminal of the battery is connected to line and the negative to ground, while with rod *N* at the top of its stroke the battery connections are reversed. When the sending tape is passing, rods *P* and *N* can travel full strokes only if the holes in the paper are such as will allow them to pass through it. These current reversals, transmitted over the line to the polarized relay, *P.R.*, cause the armature of the same to vibrate, and this motion is transmitted to the shaft of the rotating print wheel, *t*. Thus, when the negative terminal of the battery is placed to the line, the action of the relay, *P.R.*, is to draw the print wheel against the inking wheel, *i*, and when the plus terminal of battery is placed to the line the relay causes the print wheel to move towards the tape and record a code character thereon; the particular symbol depending upon the lapse of time between current reversals,

FIG. 22. WHEATSTONE AUTOMATIC TRANSMITTER.

as controlled by the perforations in the sending tape.

In the Pollak-Virag high-speed telegraph the messages transmitted are reproduced in a kind of italic script. It uses two live wires and an earth return, but, unlike writing telegraphs in general, it does not involve the maintenance of synchronism between the receiver and the trans-

mitter. At the sending end the messages are sent by means of a perforated paper tape which has been previously punched with two sets of holes. The tape is a nonconductor of electricity, and is passed over a roller made up of six electrically insulated sections; and metal brushes, pressing on the roller, form electrical connection with one or another of these sections whenever a perforation comes opposite them. The currents thus allowed to pass vary in intensity, and those from one group of three sections go to one telephone receiver at the receiving end, while those from the other group of three go to the second telephone receiver. To the diaphragms of these two telephone receivers, which are placed close together, a mirror is connected, and is so suspended that it is free to move both horizontally and vertically, in unison with the movements of the diaphragms. Now the perforations which energize one telephone are arranged to represent the vertical motion necessary in writing a character or figure, while the other set of perforations similarly represents the horizontal component. Hence the two telephones together reproduce these components, and the result is that under their combined influence the mirror moves in such a way that its motions mark out the complete characters. These motions are imperceptible directly to the eye, but when a pencil of light is permitted to fall on the mirrors the movement of the reflected ray of course increases in amplitude as the surface upon which it is received is further and further removed from the mirrors, so that the characters described may be enlarged to practically any size. At the point where the size is as large as desired, the reflected ray is made to impinge upon a photographically sensitized tape of paper, and so gives a permanent record of its movements.

Ticker or Stock Quotation Telegraphs. These systems usually comprise one master transmitter and a number of receiving instruments, tickers, connected in series; these latter print the message in ordinary type on a paper tape. The various forms encountered in practice differ in details, but the fundamental operating principles are quite similar. In the case of a simple ticker transmitter 26 pins are uniformly spaced in helical arrangement around a metal cylinder; and this is rotated by a small electric motor or clock work acting through friction drive. A bank of 26 letter keys is placed above this cylinder, so arranged that when a key is pressed it intercepts its corresponding pin and stops the rotation of the cylinder. At one end of this cylinder is a commutator arrangement for reversing the battery current 52 times per revolution. This alternating current passes over the transmission line and through the coils of two electromagnets. One of these is of the polarized type, and therefore responds to the current alternations; the other is of the neutral type, with a heavy armature which, on account of its inertia, is not influenced by the alternating current. The armature of the polarized relay acting through a light escapement turns the type wheel in synchronism with the distant transmitting cylinder. When the transmitter cylinder is stopped by the operator pressing down the key, the current-reversing mechanism stops and a steady current passes over the line. The polarized relay also ceases to actuate its escapement, and the type wheel stops at the letter corresponding to that struck by the operator. The steady current flowing actuates the neutral relay, which

pushes the paper against the type wheel, recording the letter selected. When the key at the sending station is released, the cylinder again rotates, the alternating current again flows, and the printing wheel rotates in synchronism, as before; at the same moment the neutral relay is released and then actuates the tape-feeding mechanism so that it is moved forward for the next letter.

Autograph or Writing Systems of Telegraphy. There are various forms of writing telegraphs, but probably the most complete is that devised by Elisha Gray, and known in the art as the telautograph (q.v.). There are also various devices for the transmission of drawings and pictures, but few of these have been developed beyond the experimental stage. In most cases they depend upon the varying sensitiveness to light manifested by selenium.

Municipal Telegraphs. Signaling systems are installed in cities and towns to enable rapid communication to fire department and police headquarters. See FIRE ALARM.

American Telegraph Companies. In the United States the telegraph service, excepting municipal alarm systems, is entirely in the hands of private companies. The first company was organized in 1845 under the name of the Magnetic Telegraph Company by Morse supporters and associates. In that year a telegraph line was constructed between Philadelphia and Morristown, N. J., and in the following year it was extended to New York City. In 1856 the Western Union Company was formed by a combination of the Erie and Michigan Telegraph Company with the New York and Mississippi River Valley Printing Telegraph Company. From this time combination and consolidation were carried on, the efficiency of the service increasing. In 1862 a telegraph line across the North American continent was completed and put in operation. In 1885 the Postal Telegraph Commercial Cable system was established by John W. Mackay, beginning with a few wires between the largest commercial centres in the Eastern and Western States and one transatlantic cable. In 1916 this company reached every important city in North America, and it operated seven transatlantic cables, a Pacific cable, and cables to the West Indies. In 1916 there were 26 companies doing business in the United States, but about 98 per cent of commercial telegraph service was handled by the affiliated Western Union and Postal Telegraph Cable companies. The average toll rate per message in 1870 was 75½ cents, the cost of transmission was 51.2 cents. In 1912 these figures were 49 cents and 39 cents respectively. The land-line rates for a 10-word preferred telegram in 1916 varied from 25 cents between points 250 miles apart to \$1 for a transcontinental message.

Statistics. The following telegraph statistics were compiled from the United States Senate Document No. 399 and Census Report of 1912.

The lowest charge per message in the large countries as indicated by the table (page 57) is made in France; the maximum charge occurs in the United States. This is due in part, undoubtedly, to the fact that the distances covered in the United States are very much greater, the mileage of wire being more than 5 times as great for the United States. Of the 2,214,000 miles of telegraph circuit in the United States 1,300,000 are operated by railway companies, and about

260,000,000 company messages are handled per annum over these circuits.

TELEGRAPH STATISTICS OF DIFFERENT NATIONS

COUNTRY	Messages	Average charge per message	Number of offices	Miles of line
		<i>Cents</i>		
Austria	20,840	22.5	4,480	143,850
Belgium	1,768,725	14.2	1,630	25,400
Denmark	3,447,547	14.0	560	8,700
France	64,287,600	12.0	20,300	421,000
Germany	58,556,000	18.0	45,850	1,120,000
Great Britain . .	93,360,000	17.2	13,550	556,000
Hungary	12,532,900	25.0	4,620	88,000
Italy	17,875,000	19.3	7,660	124,000
Japan	29,839,770	12.3	4,290	99,470
Holland	6,700,000	15.0	1,390	22,400
New Zealand . .	8,513,120	15.7	1,970	39,100
Norway	3,360,050	13.4	1,585	32,000
Russia	38,000,000	42.0	8,350	425,000
Sweden	4,236,000	15.3	2,855	19,600
Switzerland . . .	5,820,000	17.2	2,880	15,900
United States . .	106,532,500	49.0	30,860	2,214,000

Government Ownership. In striking contrast to the system of corporate ownership in the United States is the governmental control of the telegraphs as practiced in Great Britain and other European countries. This is reflected in the low average cost of messages to be noted in the above table. In the various European nations the telegraph is usually combined with the post office, and this has been the rule from the earliest times. In Great Britain, previous to 1870, the telegraph business was controlled by private corporations, but in 1868 a bill was introduced into Parliament, and passed in the following year, whereby the lines and property were acquired by the government at an expense of £6,750,000. In 1869 there were about 7,000,000 messages sent, which increased to 22,459,775 in 1879 and 93,873,000 in 1913. In this last year the receipts from telegraphs were £3,100,000, and a net deficit of £957,566 for telegraph service. With governmental ownership have come improved service and reduced rates. Where in 1870 it cost from 3 to 6 shillings to send a message from London to Dublin, now a message of 12 words can be sent anywhere in the United Kingdom for sixpence. In 1913 the Post Office Department controlled 14,129 telegraph offices, including 2509 railway offices and 11,620 post-office stations.

TELEGRAPHER'S CRAMP. See **NEUBOSIS**.
TELEGRAPHONE (from Gk. *τῆλε*, *tēle*,

afar + *γράφειν*, *graphein*, to write + *φωνή*, *phōnē*, sound). A device for recording and reproducing sound by means of the transverse magnetization of a steel wire or disk, based on the principle of local magnetization devised by Valdemar Poulsen (q.v.). The essential parts of the apparatus are an ordinary telephone transmitter, to which is connected an electromagnet, between the poles of which a steel wire or disk passes or revolves. Words spoken into the transmitter set up currents of varying intensity, which, passing through the electromagnet, impress upon each point of the wire or disk a transverse magnetization of corresponding strength. The wire or disk can then be made to pass by the poles of the same or a similar electromagnet connected to a telephone receiver, when the varying magnetization of the wire or disk will set up currents of like intensity as produced the magnetization, when the receiver will produce the original speech. Records formed on disks, it was claimed, could be sent through the mails in ordinary envelopes.

TELEGRAPHY, SUBMARINE. In submarine telegraphy there are many variations from the practice on land lines. (See **TELEGRAPH**.) The problem involves the transmission of current along a conductor of great length and necessarily small cross section with of course considerable resistance. In a long cable we have to consider the effect of the electrostatic inductive capacity as well as its conductivity. As it takes a perceptible time for a cable of considerable length to be charged and discharged when a current is sent through it, there is a certain limit to the speed of transmission of signals without their becoming confused and unintelligible. This slow speed of operation makes cabling very expensive, and, despite several important inventions, the difficulty has not been overcome. In fact, no submarine cable in a day of 24 hours can transmit more matter than could be read in an hour from ordinary print.

When the first Atlantic cable was used the ordinary Morse code was employed; but it was soon found that the strength of current needed to actuate the Morse receiving apparatus reduced the speed of signaling to one or two words per minute. This retardation of the speed is occasioned by the fact that a cable of several thousand miles, with its core, insulation, and sheathing, constitutes a condenser of considerable capacity. The action upon the current flow through the presence of this condenser is as follows: The instant the battery is connected to a cable a very large current flows, the major part of which goes to satisfy the capacity of the cable, and as the cable becomes charged this current

FIG. 1. CURRENT IMPULSES ON A CABLE.

settles to a steady value determined by the ohmic resistance of the line. At the distant end of the circuit a very small current begins to flow almost simultaneously with the connection of the battery, and as the cable becomes charged, this outflowing current rises in magnitude until it attains a steady value approxi-

mating the incoming current. When the battery is disconnected the entering current ceases at once, but the outflowing current slowly drops to zero as the charge flows out of the cable. In case the ordinary Morse arrangement of dot and dash were employed to transmit a message per submarine cable, the result obtained would be substantially as shown in Fig. 1. The blocks *a, a, a* represent three short current impulses impressed upon the cable at the sending end, whereas the cable not having time to discharge between impulses will have an outflowing current as in curve *b*. This outflowing current, not falling to zero between impulses, could not obviously be received by means of an ordinary relay or sounder. Neither could it be accurately read through deflections of a galvanometer. To differentiate clearly between the current pulses on a submarine line, the sending key is arranged to send dots by current impulses in one direction and dashes by current impulses

FIG. 2. DIAGRAM OF SIPHON RECORDER.

in the opposite direction, the cable being cleared out or discharged between consecutive signals by grounding.

So faint are the current impulses at the end of a cable of considerable length, even under good conditions, that the reflecting galvanometer (q.v.) or some modified or special form used for receiving signals must be of considerable sensitiveness. The amount and direction of the deflection of the suspended mirror to which the needles are attached depend on the intensity and direction of the current. A galvanometer with a suspended coil, provided it is sensitive enough, may also be used, or, what is more usual, some form of siphon-recording receiver. The siphon recorder was invented by Lord Kelvin in 1867 and has since been greatly modified and improved by various cable engineers.

A typical siphon-recorder arrangement is illustrated in Fig. 2. The galvanometer coil *C*, pivoted on fine agate bearings, is restored to zero by the use of delicate springs *SS*. The siphon consists of a very fine capillary glass tube, several thousandths of an inch in diameter. A small piece of iron is attached to the lower end of the tube, very close to the paper tape *P*, but not in contact therewith. This record tape passes over a magnetic table *T*, which is magnetized by being in contact with the electromagnet *EM*. Magnetic fluctuations or vibrations are set up in the table by means of the vibrator reed *R*, which applies different values of current to the coils of *EM*. When the period

of these vibrations has been adjusted by varying the weight of the reed to be the same as the natural period of the siphon, the latter is also caused to vibrate, as would be indicated by a series of fine dots appearing upon the moving tape, and signals are recorded by marks to the right or left of zero. The siphon is connected to the movable coil of the galvanometer through the agency of the delicately mounted cradle *I*, which is caused to rock by the motion of the

FIG. 3. SPECIMEN RECORD FROM SIPHON RECORDER.

galvanometer coil transmitted through the fine wire *F*.

In Fig. 3 is shown a specimen of signals as received over a thousand-mile section of an Atlantic cable. The characteristics as indicated by the underlined dots and dashes represent a part of the International code. (See TELEGRAPH.) To indicate which signals are dots or dashes, it is sufficient that one deflection should climb beyond the other in one direction with only a slight fall between each crest. A change in character of the signal is indicated by a pronounced fall or rise beyond a preceding peak or valley. To produce a signal equivalent to a dot or the letter *e* a positive current is sent through the line and an upward curve is produced on the record. Reversing the current or sending a negative impulse gives the equivalent of a dash or the letter *t*.

The simple key used in sending the signals consists of a pole-changing device by which a current in either direction can be sent over the circuit by simply pressing one of two keys. In automatic transmission, used on the transatlantic cables and other busy lines, the operator first punches in a paper strip holes corresponding to the proper signals. This tape is then fed into an apparatus where, guided by a central line of holes, it is passed through mechanically, and contact is made through the agency of blunt needles or brushes through the holes. These devices, however, can only be used on cables having heavy cores, but by their use a rate of 50 words or more a minute may be obtained.

In working submarine cables it was found as early as 1862 by Cromwell Varley that the sharpness and clearness of the signals was increased and the effect of earth currents eliminated by inserting a condenser (q.v.) of proper capacity between the transmitting instrument and the line. This idea was embodied in a patent in 1862 and put in practice in 1866. When first used at the receiving end it was found that the speed was considerably increased, and when placed at both ends the efficiency of the cable was practically doubled. Greater distinctness in the transmission of the signals was obtained as well as increased rapidity. The operation of a simple cable circuit will be seen from the diagram on page 59.

The cable connected with a condenser at either end is shown above. From the opposite plates of the condenser connection is made with a switch through which the current may pass either to the earth through a galvanometer or recorder or to a transmitting key, *K*, and then to the battery and earth, depending on whether signals are being sent or received at the particular station. At *K* and *K'* either pole of the battery

can be connected at will to the line, or rather to the condenser, and the cable charged inductively. The corresponding signals are produced

DIAGRAM OF SIMPLE CABLE CIRCUIT.

at the distant station, the galvanometer being connected to the line by the switch.

Duplex Working. Cables can also be worked duplex with facility and messages sent over a single cable in opposite directions. This affords an increased capacity of at least 90 per cent in handling the traffic and is the approved method of working all busy lines. The duplex system was devised in 1873 by J. B. Stearns, and in 1875 and 1876 was improved by Muirhead and Taylor. It was first used on the Atlantic cable in 1878. The connections of one end of a submarine cable for duplex working, which is the normal condition, are shown in Fig. 4, wherein *K* is the sending key, putting the cable to the ground when neither button is pressed, *BR* is auxiliary balancing resistance for fine adjustments, the artificial line substantially equal to the cable in resistance and capacity is indicated as is the siphon recorder, while *C*, *C*, and *C* represent condensers inserted to prevent the earth currents from interfering, which may otherwise produce a wandering zero or disturb the incoming signals.

With duplex work established the next consideration is some form of automatic repeater or relay to transmit signals at intermediate points, e.g., at Newfoundland and Ireland in the line from America to England, or at Honolulu, Midway, and Guam on the route from San Francisco to Manila. These instruments not only must be as sensitive as receivers, but must provide for sending along the signals over a further stretch of cable or telegraph line. The usual types of relays employed over long cables are those of Brown, Heurtley, and Orting. In the Brown drum relay there is a rotating cylinder across which a pointer similar to the ink tube of the siphon recorder may move under the influence of the current in the coil. This pointer normally rests on a central insulated or neutral portion, but as it moves from side to side it establishes contact with a conducting surface through which a circuit is completed with a local battery in a direction corresponding to the swing of the pointer. This of course operates a local transmitting instru-

ment and sends along the signal as received from the first cable over a second cable or land line.

The Heurtley relay, which is used on the Pacific cable to magnify the signals on Fanning Island, especially those from Vancouver Island, resembles a siphon recorder without the paper band driving mechanism and the pen. The movement of the recorder affects a light lever of glass over which a bronze wire is stretched. Normally this fine wire is cooled by an air current, but with any movement of the pointer the wires are moved away from the slit through which the air comes, and the resistance is changed so that the local recorder is affected. In the Muir-

head relay, which served to reduce the time of transmission from New York to Buenos Aires from 20 to 3 minutes, and the number of manual retrasmittions from 6 to 1, the moving element is a vane which causes a gold wire to oscillate between two contact pegs of gold and silver. In addition to the relays mentioned there are also the vibrating relay of Gulstad used for nearly a quarter century by the Great Northern Telegraph Company, and other types designed by S. G. Brown, which have been used with more or less success, as well as a number for which patents have been secured.

The methods outlined for submarine signaling have involved the use of direct current, with the limitations already discussed. Very early efforts were made to transmit signals by the use of inverse currents to either annihilate the discharge current or at least to diminish it considerably. In other words, this meant the changing of the polarity of successive impulses; and

FIG. 4. ARRANGEMENT OF CABLE FOR DUPLEX WORKING.

attempts were made to use this fundamental idea as early as 1856. Soon after 1880 a method was adopted of using an inverse current regulated as to its strength and time of duration, so that on short cables an inverse current of only two-thirds the strength of the outgoing current was employed, a polarized relay being an essential feature of the system. The most important system, however, was devised by Picard in 1898, a method that has been used between Algiers and Marseilles, and even between Algiers and Paris, 1120 land miles, of which about one-half was submarine cable. By this method a Baudot type printer was worked over cables 900 kilometers (559.2 miles). By various improvements type-printing apparatus can be worked over nearly 1000 miles of subma-

rine cables. In this system the outgoing impulses are equal in time and are of short duration, and two impulses sent one after another have a contrary polarity. After each impulse the sending end of the cable is insulated. In the Picard method the messages were sent in Morse code, and were received by a very sensitive dynamometer relay, which was connected by a stronger type-printer relay. Various other schemes for using inverse currents were proposed, but with the exception of Picard's work nothing of any considerable importance was done until the invention of the Gott method, whereby ordinary Morse signals could be relayed from a land line to a submarine cable, and vice versa, and a number of sections of lines of various kinds united for direct transmission. In fact signals were sent over this line from Bamfield on the western coast of British America to London, without any manual retransmission. In the Gott method, brought out in 1913 by the Commercial Cable Company, the direction of the current is changed after each signal by the use of a polarized relay of suitable sensitiveness and similar to that employed on land lines. While this method was used with success the taxing of all available facilities of the cables due to the Great War rendered it impossible to perfect the system for continuous commercial use. Attempts have been made to employ alternating currents but without sufficient success to warrant their continued use.

History and Statistics. The feasibility of laying a line for the transmission of signals along the bottom of the ocean seems to have been first suggested in 1795 by a Spaniard named Salvia. Eight years later a nephew of the famous electrician Galvani performed experiments of a similar nature in the deep sea off Calais. The first really important experiments, however, bearing directly upon this subject are believed to have been those of Sömmering and Schilling, who in 1811 applied a soluble insulating material to a conductor which was laid across the river Isar near Munich. These investigators also used a submarine conductor to explode gunpowder by an electric current. In 1813 an Englishman named John Sharpe transmitted signals through 7 miles of insulated copper wire laid on the bottom of a pond, but the first practical attempt to use such a conductor to transmit telegraphic signals was by Colonel Paisley of the Royal Engineers at Chatham, England, in 1838. He surrounded his conductor with strands of tarred rope and wrapped the whole with pitched yarn. In 1839 Dr. W. O'Shaughnessy at Calcutta laid across the Hugli River copper wire covered with bamboo and then coated with cotton and tar. In 1840 Wheatstone proposed a scheme similar to those of the last two inventors, and later suggested the use of gutta-percha as a covering for the wire, but was unable to put his idea into practice. Prof. S. F. B. Morse, of New York, laid an insulated cable between Castle Garden and Governor's Island, and as a result of his experiments came to the conclusion "that a telegraphic communication on his plan might with certainty be established across the Atlantic." The idea that submarine conductors for telegraphic purposes could be constructed was rapidly taking root, and in 1845 the Messrs. Brett, who were active in the construction of the first telegraphic lines across the English Channel and the first Atlantic cable, registered a "General

Oceanic Telegraphic Company" for the purpose of establishing telegraphic communication between England and America. In 1850 an experimental line was laid across the English Channel by the Messrs. Brett, and this was followed in 1851 by a permanent cable of such excellent construction that it survived for a number of years. Several longer lengths of submarine cable were laid within the next few years. Italy was connected with Corsica and Sardinia, and Sardinia with Africa. A Black Sea cable was laid in 1855, but operated only a short time.

Thus far attempts to lay submarine telegraph lines had been confined to comparatively short distances. In 1858, after repeated unsuccessful experiments, telegraphic communication was established across the Atlantic. After something over a hundred messages had been sent back and forth, the cable ceased to work. Although this cable was a comparative failure, yet its brief success proved two things: (1) that a cable could be laid through 3000 miles of deep sea; (2) that the electric current could be transmitted through a wire of that length. It was not until 1866 that a permanent cable was laid across the Atlantic. (The detailed history of this undertaking is described under ATLANTIC

THE SUBMARINE CABLES OF THE WORLD TO

TELEGRAPH.) A second Atlantic cable was inaugurated immediately after, the one which had broken in the laying in 1865 having been repaired. In 1859, after the first Atlantic cable had ceased to work, the Red Sea and East Indian Telegraph was laid, over a route 3043 miles long, but this also proved a dismal failure and was finally abandoned. The Malta-Alexandria cable was laid in 1861, and was in use till 1872, when, from repeated breakages in shallow water, its use was discontinued. The core consisted of a strand of seven copper wires, covered by three layers of gutta-percha; outside of this was a serving of tarred yarn; and, finally, 18 iron wires constituted the sheathing. This was the first long cable successfully laid (its total length, in three sections, being 1331 miles); and it was also the first properly tested under water before being laid, and carefully constructed with constant watchfulness as to its electrical and mechanical conditions. In 1869 a cable 2328 miles long was laid from Brest, France, to the island of Saint-Pierre, south of Newfoundland; in 1873, one from Lisbon to Pernambuco, Brazil. In 1874 another transatlantic cable was laid, and from that time there have been numerous submarine lines established whose history is discussed under ATLANTIC TELEGRAPH. The Western Union Telegraph Company in 1900 laid a new cable

of the heaviest and most improved type between Newfoundland and Penzance, England. In 1914 before the war there were 17 cables operated between the United States and Europe. One of the earliest hostile acts in the war was the cutting of the German cables to America. This left the Teutonic allies without direct service to America and acted greatly to their disadvantage.

In 1902 the British Pacific cable between Australia and British Columbia, 7800 nautical miles in length, was completed, and in 1903 the first American cable was laid across the Pacific, with a length of 7846 nautical miles, by the Commercial Cable Company, between San Francisco and the Philippines. This cable touches at Hawaii, Midway Island, and Guam. Later it was extended from Manila to Shanghai and to Japan by way of the Bonin Islands. In 1914 the total length of submarine cable was stated at 286,242.5 miles, representing an outlay of over \$350,000,000.

Construction of Cable. A submarine cable consists of four parts: (1) The central conductor, or core, to carry the current. This is made of copper wire, either solid or in strands. (2) A covering of insulating material to prevent the current from being dissipated. This is usually made of gutta-percha, although for some submarine cables rubber has been used instead. (3) An outer covering to protect the insulating material from injury. This is usually of yarn, tape, or canvas. (4) The sheathing or spiral armoring of steel wires, laid on closely. The cable is generally divided into three sections: the deep-sea section, the intermediate portion, and the shore end. The last portion has to be constructed with greatest care and strength, as in shallow water there is more danger of injury from rocks and other causes. It is estimated that a deep-sea cable weighs about one ton per nautical mile. Cables cost from \$350 in deep sea to \$1500 at the shore end per mile. The cost of maintenance is often heavy and requires the services of specially equipped vessels.

TEL EL AMARNA. See **TELL EL AMARNA.**

TEL EL KEBIR. See **TELL EL KEBIR.**

TELEMACHUS, tē-lēm'ā-kūs (Lat., from Gk. Τηλέμαχος). In Greek legend, the son of Ulysses (q.v.) and Penelope (q.v.). At the opening of the *Odyssey* he is represented as led by Athena, who had appeared to him in the guise of Mentor, a trusted Ithacan friend of Ulysses, in search of tidings of his long-absent father, since he was unable alone to expel the insolent suitors of his mother. Having visited Pylos and Sparta, Telemachus returned to Ithaca, where he found his father in the guise of a beggar, at the hut of the faithful swineherd Eumæus. After Ulysses had revealed his identity to his son, they carried out a plan for the slaying of the suitors. In post-Homeric legend, after the death of Odysseus Telemachus and his mother accompanied Telegonus (q.v.) to the island of Circe (q.v.), where Telegonus wedded Penelope, and Telemachus Circe.

TELEMACHUS. A Syrian monk who in 404 A.D. leaped into the arena of the Coliseum during a gladiatorial combat, attempting to separate the contestants. He was stoned to death, but his heroic protest led Honorius to suppress gladiatorial fights; at least there is no evidence of their taking place after this time.

TELÉMAQUE, tā'lā'māk', **AVENTURES DE** (Fr., *Adventures of Telemachus*). A romance, with some political significance, by Fénelon (1699), founded on the adventures of the son of Odysseus and largely influenced by Barclay's *Argenis* (q.v.).

TELEMETER (from Gk. τήλε, *tēle*, afar + μέτρον, *metron*, measure). An instrument for measuring the distance to a remote object, used in surveying and in military operations by engineers and artillerymen. There are many forms of telemeter, which consist for the most part of telescopes and mirrors by means of which angles can be read and the distance computed. The telemeter of the United States Coast and Geodetic Survey is more generally known among American engineers as the stadia (q.v.), and in Great Britain as a tachometer. It consists of a mounted telescope with two extra horizontal cross wires or stadia hairs that intercept a certain number of divisions on the image of the graduated rod held upright at the distant point. The distance of the rod from the instrument is obtained by multiplying the reading by a constant factor which depends upon the construction of the telescope. Stadia measurements are particularly useful in making a rapid survey or reconnaissance and are accurate to about one part in 700. Consult I. O. Baker, *Engineer's Surveying Instruments* (2d ed., New York, 1892). See **RANGE FINDER**; **SURVEYING**.

TELEOLGY (from Gk. τέλος, *telos*, end, completion + λογία, *-logia*, account, from λέγειν, *legein*, to say). A term used in philosophy to denote any theory which explains the world as in some way controlled by intelligent purpose. The question teleology answers in the affirmative is whether in the universe as a whole, or even in the phenomena of terrestrial organic life, there is some actually purposed end controlling the course of events. It is certain that the tendency to interpret actions teleologically appears in very early childhood. Primitive animism (q.v.) seems to rest on a deep-seated instinct, and a mechanistic (see

MECHANISM) conception even in limited application was achieved with great difficulty. The prevailing trend of Greek thought was teleological and it culminated in the systems of Plato and Aristotle. The more mechanistic views which resulted in the materialism of Leucippus and Democritus did not meet with general acceptance. It was reserved for modern science to develop a thoroughgoing, systematically and experimentally grounded mechanism. Probably the greatest blow to teleology was the appearance of Darwin's *Origin of Species*.

At present teleology is maintained mainly in idealistic circles in philosophy. For instance, James Ward, Josiah Royce, Bernard Bosanquet, and Hugo Münsterberg are all teleologists. They do not deny the partial value of the mechanistic hypothesis, but they subordinate mechanism to teleology. For them mechanism is a descriptive device, but as reality is at heart spiritual in nature, teleology is the more adequate point of view.

Bergson has attempted to develop a view according to which neither mechanism nor teleology has ultimate validity. For him teleology is only an inverted mechanism, belying the spontaneity and unforeseeableness of vital development, and yet nearer the truth than the mechanism of efficient causation. "The future appears as expanding the present: it was not therefore contained in the present in the form of a represented end. And yet, once realized, it will explain the present as much as the present explains it, and even more; it must be viewed as an end as much as, and more than, a result." Consult: Paul Janet, *Final Causes*, Eng. trans. from 2d Fr. ed. by William Affleck (New York, 1883); Franz Erhardt, *Mechanismus und Teleologie* (Leipzig, 1890); Max Adler, "Kausalität und Teleologie im Streite und die Wissenschaft," in *Marx Studien*, vol. i (Vienna, 1904); Bernard Bosanquet, "Meaning of Teleology," in *Proceedings of the British Academy* (London, 1905-06). See also **MATERIALISM**; **MECHANISM**, and references there given.

TELEOSAURUS (Neo-Lat., from Gk. τέλειος, *teleios*, τέλειος, complete + σαῦρος, *sauros*, lizard). An extinct crocodile, fossil skeletons of which are found in the Jurassic rocks of Europe. The animal was small and had a much elongated tubelike snout armed with numerous small outward-curving teeth. The body was covered by tuberculated scutes. See **CROCODILE**.

TELEPATHY (from Gk. τήλε, *tēle*, afar + πάθεια, *-patheia*, from πάθος, *pathos*, feeling). A term coined by members of the Society for Psychical Research: "We venture to introduce the words *Teleesthesia* and *Telepathy* to cover all cases of impression received at a distance without the normal operation of the recognized sense organs." (See **PSYCHICAL RESEARCH**, **SOCIETIES FOR**.) E. Gurney, F. Myers, and F. Podmore in *Phantasms of the Living* (1886) say that "under particular conditions of excitement—the rationale of which we probably do not understand, though insensibility and the near approach of death are apparently some of the most effectual of these conditions—certain persons seem to have the faculty of communicating to other persons at a distance what is happening to them, often without any intention or consciousness of doing so on their own parts," and further, that "certain small experimental results can be produced," and that "certain im-

pressive spontaneous phenomena are shown to belong to the same class." Hyslop uses the term to cover "coincidences between two living persons' thoughts which are not due to chance coincidence or to normal sense perception." He thus defines it negatively as a "name for the facts that baffle normal explanations, and indicate our ignorance, not our knowledge." Most of the investigators in the field, while admitting a bias, profess their willingness to rest their case upon the experimental findings. Every attempt is made to control the conditions; and cases which are not properly attested, or which can be explained by muscle reading, hypersensitivity, etc., are eliminated.

The actual evidence upon which the belief in telepathy now rests may be classified as (1) experimental, the communication from agent to percipient of simple visual impressions—diagrams, and color, suit, and number of playing cards, etc.; (2) certain striking cases of the induction of sleep at a distance, notably that of Madame B., or Léonie, reported by J. Ochorowicz; (3) statistics of what are known as veridical hallucinations, i.e., apparitions of a person to some distant friend at the time of the person's death; (4) the performances of certain test mediums, especially of one, Mrs. Piper, whose case has been investigated at length by the Society for Psychical Research; and (5) results of cross correspondences, i.e., cases in which two mediums at a distance from each other simultaneously produce automatic script which is meaningless until the two specimens are put together. All this evidence itself rests upon the assertion that the number of coincidences exceeds the number attributable to chance according to the law of probability; e.g., veridical hallucinations are said to be 440 times more numerous than they should be according to chance alone. The verdict of science is still, however, "not proven."

TELEPHONE (from Gk. *τῆλε, tēle*, afar + *φωνή, phōnē*, sound). An instrument for the transmission and reproduction of articulate speech between two or more distant points. The idea of transmitting sound to a distance found its first practical expression in the speaking tube and later in the string telephone. The latter comprises two hollow cylinders, one end of each being covered by a taut membrane and connected with the other by a stretched string. The vibrations of the diaphragm of one cylinder caused by the sound waves striking it are transmitted through the string to the other membrane. Hooke referred to such a combination when in 1667 he stated that by the help of a tightly drawn wire, sound could be propagated to a considerable distance, even through stone walls and surrounding buildings. Sir

Charles Wheatstone described in the *Repository of Arts*, September, 1821, an instrument for transmitting sounds, which he called the telephone. This device consisted of a number of solid rods connecting musical instruments with sounding boards, which were placed at a distance from the instruments, and it is stated that the sound was successfully reproduced.

The present article, however, deals with the electrical reproduction of articulate speech. The discovery of Oersted in 1819, showing the relation between electricity and magnetism, that of Sturgeon of 1824 showing how a magnet was produced when current circulated around a coil of wire surrounding an iron core, and that of Sir Michael Faraday showing that electricity was induced in a conductor when moved in a magnetic field, are all of extreme importance to the development of the electrical telephone. The germ of the telephone may be dated back as far as 1837, when Page of Boston found that a bar or needle of iron would give out sound when subjected to rapid cycles of magnetization and demagnetization.

Charles Bourseul in *L'Illustration*, Paris, 1854, prophesied the transmission of speech: "I have asked myself, for example, if the spoken word itself could not be transmitted by electricity; in a word, if what was spoken in Vienna may not be heard in Paris? It is practically this way: suppose that a man speaks near a movable disk, sufficiently pliable to lose none of the vibrations of the voice, that this disk alternately makes and breaks the connection from a battery; you may have at a distance another disk which will simultaneously execute the same vibrations."

The first electrical apparatus described as a telephone by its inventor was devised by Philipp Reis (q.v.) of Germany in 1861. This embodied the suggestions of Bourseul and the Page effect. The elements of the Reis telephone are shown in Fig. 1. The flexible disk of mem-

FIG. 1. ELEMENTS OF REIS TELEPHONE.

brane *D* mounted over the opening of a box carried a small piece of platinum *P* at its centre; near this is the spring *S* with which the platinum alternately made and broke contact when the membrane was caused to vibrate by the sound waves. These contacts form the terminals of a circuit containing a battery *B* and the receiver *R*. The making and breaking of the circuit between *P* and *S* caused intermittent currents to flow through the coil of the receiver, these producing molecular vibrations in the needle giving out sound as noted by Page. This sound was considerably amplified by the sounding box on which the needle was mounted. By such means the pitch of any sound may be reproduced at a distance, but this is only one characteristic, for, besides it, sound has quality or timbre, which makes it distinctive, and degrees of loudness or intensity. To transmit articulate speech these three elements must be reproduced, and this cannot be done by any apparatus which functions through current interruptions. Hence the Reis telephone failed to reproduce any but

pure musical notes and then only as regards pitch.

Invention of Bell. No apparent advance was made in working out the problem of the articulating telephone for about 16 years after Reis's work, but on Feb. 14, 1876, Prof. Alexander Graham Bell of Boston applied for United States patent rights on new and useful improvements in telegraphy in which a method for transmitting vocal sounds was described and claimed. United States patent number 174465 covering this method was granted March 7, 1876. Prof. Elisha Gray applied for a patent on the same day for a similar instrumentality. Extensive and long-drawn litigation over the question of priority resulted, but Bell's claims were ultimately sustained by the Supreme Court. The principle of the Bell instrument is shown in Fig. 2, and when using this the speaker talks

FIG. 2. ELEMENTS OF BELL TELEPHONE.

at a thin sheet-iron diaphragm which vibrates in synchronism with the sound waves impinging upon it. This vibration is transmitted electrically to a similar device at the distant station. The diaphragm *D* is placed behind a conical mouthpiece which the speaker holds close to his mouth and the listener close to his ear. A magnet *M* is placed back of the diaphragm and upon its forward pole piece, which is very close to, but not in contact with, the disk, is located a coil *C* of many turns of very fine insulated wire. The ends of the coils are connected to the transmitting wires as shown in Fig. 2. One instrument serves as the transmitter and the second as a receiver, though their functions are reversible. No battery is needed, for the transmitting instrument generates the actuating currents as follows: the magnet *M* causes a certain number of magnetic lines to pass through coil *C*; many find their way into the iron diaphragm and when this vibrates it produces a change in the number of magnetic lines passing through the coil *C*, increasing as *D* approaches the pole tip and diminishing as it recedes. This variation of magnetic lines induces a voltage and current in coil *C* in accordance with Faraday's discovery of electromagnetic induction in 1832. As the current flows through the coil at the receiving instrument, it either momentarily strengthens or weakens the magnet. This change causes the diaphragm of the receiver to vibrate in synchronism with the actuating disk and thus the sound is reproduced. The receiver of to-day is in principle the same as the original Bell receiver with detail mechanical improvements. For instance, a compound magnet may replace the single bar, or a bipolar magnet with coils on each of its pole tips as in Fig. 3 may be used. This latter form is more sensitive and responds to currents of less than one millionth of an ampere.

Transmitters. The Bell transmitter, while perfectly satisfactory for short lines, was not powerful enough to satisfy the requirements of longer lines and it was consequently replaced by another form, now known as the carbon

transmitter. In this device a change in contact resistance between carbon elements is produced by the sound waves, altering the pressure between the contact surfaces; and this sets up current pulsations in synchronism with the sound waves. Previous to this, however, both Bell and Gray invented electrolytic transmitters

FIG. 3. BELL RECEIVER.

of almost the same character. These comprised needles mounted at the centre of vibrating diaphragms dipping into a liquid of rather low conductivity. The current passed through the needle and the liquid, and the resistance of the circuit varied with the depth of immersion of the needle into the liquid as influenced by the vibrations of the diaphragm. The next transmitter was that of Berliner, 1877, based on the variation of resistance with pressure. A diaphragm vibrated in contact with a metal knob, and Edison at about the same time devised a transmitter wherein a button of compressed

FIG. 4. WHITE SOLID-BACK TRANSMITTER.

carbon was in contact with a small disk of platinum on the diaphragm. The microphone of Hughes, 1878, wherein two bodies are in loose contact, has furnished the type of modern transmitters and in these the carbon is in the form

of finely divided granules held between two conducting plates, one of which is the diaphragm on which the sound waves strike. The transmitter in most general use at present is the White or solid-back transmitter, Fig. 4. In this the carbon granules are placed between two

FIG. 5. INDUCTION COIL IN TRANSMITTER CIRCUIT.

carbon disks, one being in contact with the solid back of the instrument, while the other is carried by the diaphragm with which it vibrates. The rear disk forms one electrode while the front one, insulated from the rest of the apparatus excepting through the carbon granules, is connected to the opposite pole of the circuit.

The variation in the resistance of a transmitter should produce a marked degree of variation in the current, and to accomplish this it is necessary that the resistance of the circuit containing the transmitter shall be small; to this end Edison introduced an induction coil into the transmitter circuit. As employed the induction coil comprises a primary winding of a few layers of moderately heavy copper wire, a concentrically wound coil or secondary of a larger number of turns of finer wire, and a core of soft iron wire. The primary coil *P* is placed in series with the transmitter *T* and the battery *B*; the secondary coil is connected to the transmitting line as shown in Fig. 5. Any difference of intensity in current caused by a change of resistance in the transmitter circuit will induce currents in the secondary which will alter the magnetism of the distant receiver and the original vibrations of the sound waves will be reproduced. The addition of the induction coil makes the apparatus more effective and the increase in voltage caused by the many turns of the secondary enables the message to be transmitted a much greater distance.

The telephone was at first intended for private use, but very early in the history of its development, 1877, G. G. Hubbard (q.v.) recognized that its scope could be greatly extended by the establishment of telephone exchanges, to which the instruments of subscribers could be connected and at which any one subscriber could be connected to another by appropriate switching arrangements. Thus a complete telephone equipment must be provided with signaling devices so that the operator at a central station can call the subscriber or the converse. In the case of a local battery equipment, the subscriber's outfit is provided with a magneto and bell. The magneto is a small electric generator in which the armature is revolved by a few

vigorous turns of a crank and a current of 75-100 volts transmitted over the lines to the exchange, at which point a drop or buzzer is actuated. The apparatus of a subscriber's equipment on a local battery system is sometimes arranged as shown in Fig. 6. When the receiver is on the hook, the line connections are such that the bell and magneto are in circuit. The magneto on account of its high resistance is automatically short circuited when not in use. The subscriber when signaling central leaves the receiver on the hook and turns the crank of the magneto. When he is ready to talk the receiver is taken off the hook, the signaling circuit is cut out, and the talking circuit, including the transmitter and receiver, is introduced. In the figure the dotted lines show the portions cut out by the hook in its various positions.

In the ordinary or multiple switchboard when a party calls his signal is shown at a drop near what is termed the answering jack in the exchange and when a party is called the connection is made to what is termed the ringing or multiple jack. Only one answering jack exists per subscriber, but each subscriber has a large series of multiple jacks, the number depending upon the size of the exchange. In the case of the multiple type of board, the subscribers' answering jacks are arranged over various panels, but only one for each subscriber, and at these are placed the corresponding indicator drops or lamp signals actuated when the subscriber calls. The multiple jacks, however, are usually so arranged that every operator has one for every subscriber within arm's length. For instance, if say 3000 subscribers are connected to an exchange, about 300 answer jacks are arranged per panel, or 10 operators' panels would be needed with two extra end panels. Above the answer jacks are the multiple or calling jacks, 1000 for each panel. Three panels

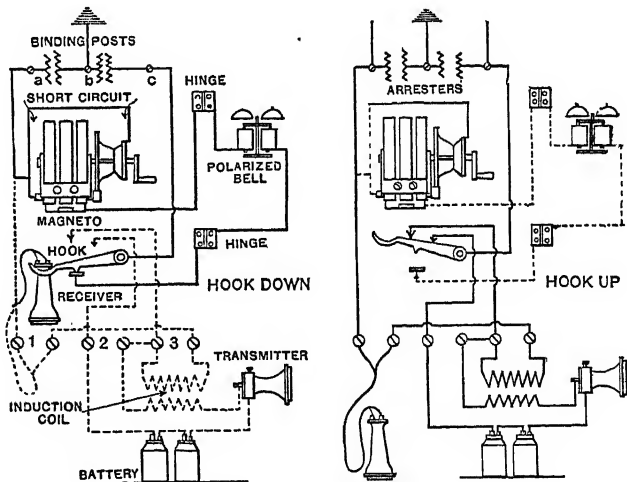

FIG. 6. SUBSCRIBER'S EQUIPMENT. LOCAL BATTERY SYSTEM.

comprising a section would have the entire number of subscribers placed upon them. At the extreme right of the board there would be a panel without answer jacks and similarly at the extreme left. The multiple jacks on the left hand panel would number 2001 to 3000, on the second panel they would number 1 to 1000, and on the third panel they would number 1001 to 2000. Hence the operator sitting at

the second panel would have within her reach multiple jacks of every subscriber. Each section is comprised of three panels. The connection between subscribers during a conversation is made by means of a cord circuit as illustrated in Fig. 7. When a call is received the current coming in on the line wire causes the drop to fall, thus announcing the number of the calling subscriber; central operator then inserts the answering plug into the corresponding jack and presses the listening key, thus placing her instrument into circuit. She then inserts the ringing or calling plug into the nearest calling jack belonging to the

line of the desired or called subscriber and by pressing the ringing key sends a signal to the latter's instrument. When the conversation between the connected parties on the magneto or local battery system is completed, the subscribers ring off by placing their receivers back on the hooks and turning the magneto cranks; this sends a current through the clearing-out drop connected across the cord circuit, which buzzes and indicates to central that the conversation is completed.

Common Battery Systems. The use of a common battery at a central station has been an important development in the telephone exchange, as it does away with the magneto call at the subscriber's instrument, which is the most expensive part of the equipment, and assures reliability of signals, as that is accomplished automatically when the receiver is removed from the hook. Further there is a saving in using one large battery centrally located in place of separate sets at the various subscribers' instruments. Placing the talking

energy or common battery system employed by the Bell companies. To signal the central station the subscriber simply removes his receiver from the hook, thus closing a circuit which acts upon a relay and causes an incandescent lamp to glow. The circuit, starting from *a*, continues along wire *c*, through lamp relay, to line *L/L'*, to ground. This gives the signal to the central

FIG. 7. CIRCUIT ON OPERATOR'S BOARD. LOCAL BATTERY SYSTEM.

operator, who immediately makes the talking connection by inserting the answer plug into the answer jack and pressing her listening key; then having obtained the number of the desired subscriber, the operator tests the sleeve of the nearest multiple jack of the called party with the tip of the calling plug, and if no click is heard (showing the battery is not connected to the socket of the jack, i.e., line not busy) she pushes the plug all the way into the jack and presses the ringing key, exactly as in the case of the multiple board in the local battery system. The diagram, Fig. 8, shows the circuit when the line is not arranged for talking. The sides of the line are represented by *L* and *L'*, the central office battery, usually a storage battery of 24 volts, by *B₁*.

P and *S* are the primary and secondary windings of the subscribers' induction coil. Between the points *a* and *g* at each subscriber, a bell *B* and a condenser *C* are permanently bridged. At the point *e* a tap runs to one side of the receiver *R* through the induction coil winding *P* to the *L'* side of the line through *S*. The hook switch makes contact at *l*. The transmitter *T* is inserted between the hook switch *H* and the point *g*. The connections at both ends of the line are identical. Assume the transmitter *T* to be at rest, the answer

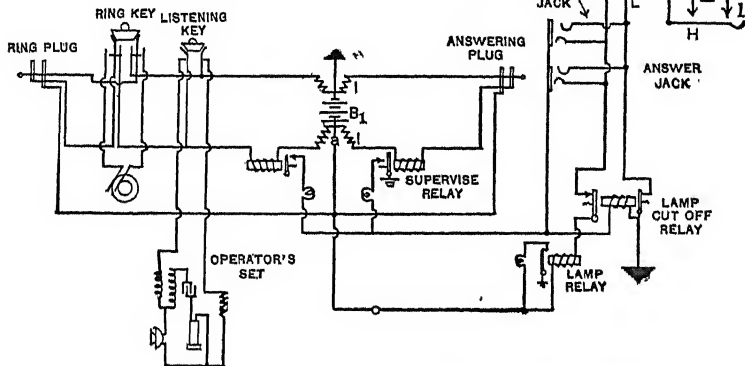

FIG. 8. CIRCUIT ON OPERATOR'S BOARD. CENTRAL ENERGY SYSTEM. (Hayes's arrangement.)

battery at a distance from the transmitter tends to introduce difficulties in the clearness of speech transmission. Various systems have been devised by Stone, Hayes, Kellogg, Dean, Carty, and others which largely eliminate the trouble. Hayes's arrangement (Fig. 8) illustrates the fundamental principles of the central

plug to be in and the hook up; it has a certain resistance, and owing to the battery voltage, a current will flow from the positive side in the direction of the arrow, along the *L* side of the line, through the transmitter *T* to the hook switch, thence to the negative side of the battery. Between the points *e* and *g* there will be a certain

difference of potential and the condenser C will be charged to the same pressure. Suppose the transmitter be spoken to and its resistance suddenly decreased, not only will a greater current flow through the path just described, but in addition a portion of the charge in the condenser will pass from the positive side in the direction of the arrow, through the winding P of the induction coil, and thence to the negative side of the condenser, the same direction as before. This current, traversing the winding P in the direction of the arrow, will induce a current in the winding S . The condenser thus increases the line current, which in turn increases the effect in the receiver at the other end of the line. The coils I , at the exchange, which may be either impedance coils or special induction coils (called repeating coils), prevent the talking current from being shunted through the battery.

In the case of a 10,000 subscriber switchboard the storage battery must be capable of giving an average current of 500 amperes, and to insure proper working condition it must give a discharge of not less than 2000 amperes. For charging such a battery as this, suitable generators must be employed, and these must deliver a charging current to the battery of at least 1000 amperes. The introduction of such currents as these has resulted in power plants at central offices, upon which the operation of the telephone switchboard and apparatus is wholly dependent. All of the various systems for central energy in actual practice are necessarily exceedingly complex and are subject to important modifications and improvements.

In most large cities the greater number of telephone calls originating in one exchange are for subscribers connected to some other exchange. For instance, in cities like New York and London, probably 80 per cent of the telephone calls are trunked from one exchange to another. The procedure in such a case is substantially as follows: Various trunk lines run from one exchange to another and these are in charge of trunk-line operators. When a local operator receives a message for an exchange other than her own, the trunk operator is called up, connections made between the answer plug and the trunk operator's line, who in turn connects to the central designated. The trunk operator at the second central connects the selected trunk line and notifies the local operator at that exchange to connect in with the party called. In the case of an ordinary multiple board the multiplication of the ringing jacks or multiple jacks varies substantially as the square of the subscribers connected. For instance, in an exchange of 3000 subscribers, with 300 per panel, there would be 30,000 multiple jacks; with an exchange of 9000 subscribers arranged in the same manner, there would be 270,000 multiple jacks or nine times as many as in the first case. Thus the multiple board soon reaches its limit and it is estimated that 10,000 is the maximum number of subscribers that can be satisfactorily connected to such type of board.

In view of the fact that such a large percentage of calls originate in one exchange and terminate in some other exchange, the later types of board have been modified to resemble in their action the trunking arrangement. This form of board is known as the transfer, express, or A and B type; and in this there are no multiple jacks, simply the answer jacks, the signaling device, and transfer lines.

In most of them the annunciators, or more usually lamps, and the answering jacks are combined at a special board designated the call or B board, while the answering and the giving of instructions for connections are done at the order or A board. Transfer lines are run between the two boards fitted with signaling apparatus to insure prompt attention. In operating, the call is received at B board and at once transferred by the B operator without answering through a transfer line to the order (A) board, a lamp lighting to show the call. The A operator ascertains the number required and instructs by order wire a B operator at the proper B board to connect the required number. This second B operator selects the proper transfer line to be used and notifies the A operator who in turn again advises the first B operator what connecting lines or transfer lines have been selected for the call originating at her board. In this arrangement, therefore, three operators instead of one handle the call. This requires somewhat longer time, but since in practice records show that the time of answering a call on the part of an exchange is from three to five seconds, the delay incurred is not excessive.

Lines. The connections between subscribers and exchanges in most telephone circuits, and particularly in all telephone circuits outside of rural communities, are entirely metallic and of copper. The disturbances introduced by grounded circuits are such that clear conversation is most difficult. When a single telephone wire swings in the earth's field, voltage is induced therein which will cause a flow of current, varying in direction as the wire swings back and forth, introducing false tones. Also when any difference of potential exists between terminals of the grounded line, earth currents flow through the telephone wire, again interfering with the signal or conversation by producing buzzing and humming in the line. When double circuits, i.e., entirely metallic ones, are used, there is also trouble, common as well to grounded circuits, which is technically defined as induction disturbance. When telephone wires run close to power transmission lines, the varying magnetic field around the power wires interlinks with the former and induces in them a voltage of the same frequency as the power current. Passing storm clouds charged with electricity will also produce current flow in the telephone conductors by static influence. These phenomena also cause buzzing and humming in the instruments. Similarly there is electromagnetic induction between neighboring telephone wires which results in the production of what is known as cross talk. To prevent such noises and cross talk, the wires of a telephone line are usually transposed every quarter of

FIG. 9. TRANSPOSITION OF LINE.

a mile. Fig. 9 shows a common transposition scheme. The vertical lines represent the cross arms of the poles where the transpositions are made. In all cases two adjacent telephone circuits must not be transposed at the same points, the transposition points being

staggered or alternated with respect to each other; on very busy lines the transportation is carried on so frequently that the circuits become twisted wires with about 10 twists per mile.

Long-Distance Telephony. This was first made possible in 1885 when the American Bell Telephone Company organized the American Telephone and Telegraph Company. For several years previously experimental lines with metallic circuits of hard-drawn copper were operated between New York and Boston. In 1885 a regular line between New York and Philadelphia was constructed and so great was its success that within two years lines were established between New York and Boston, Albany and Rochester, Chicago and Milwaukee, Boston and Providence, and New York and New Haven. The New York and Chicago circuit, 950 miles distant and having 1900 miles of wire, was opened in 1902, and the circuit connecting New York and San Francisco, with about 6800 miles of wire, was opened Jan. 25, 1915.

In long-distance circuits various added difficulties were encountered, known as attenuation and distortion. Attenuation is a simple falling away of the amplitude of the vibration due to the ohmic resistance loss in the conductor. This in itself is not harmful if not carried too far and it may be avoided to some extent by the use of large conductors. Distortion is due to the fact that waves of different periods or rates of vibration are unequally affected. As already pointed out, speech waves are made up of the combination of waves of various frequencies (pitch) and of various shapes (timbre). If the relative proportions or positions of the waves are altered in telephonic transmission, distortion results and the special quality of the sound is lost. In fact the words may become indistinguishable even though the volume of the sound is large. In about 1885 Oliver Heavyside showed mathematically that by adding inductance to a line having an excessive capacity, as most long telephone lines have, and particularly so if they are underground, the distortion of the telephonic waves might be prevented and the speaking improved.

Pupin Loading Coils. Various attempts to introduce this inductance properly have been made, but the practical application of inductance appears to have been neglected until 1900, when Dr. M. I. Pupin of New York took out patents for improving the speaking on long telephone lines. The essential part of his discovery was the determination of the amount of correcting inductance to be added and the points at which this inductance should be joined in series to the line. The mitigation of the distortion trouble in accordance with the Pupin method is to-day termed loading the line. It has been a common mistake to suppose that this method depends upon the so-called neutralizing or balancing of capacity by inductance reaction. As a matter of fact the condition of resonance obtained when the inductance multiplied by the capacity is equal to $\frac{1}{(2\pi f)^2}$, is not at all desirable

in telephony as it would tend to exaggerate one particular frequency and damp out the others, this being fatal to telephonic transmission of speech. The Pupin invention depends upon entirely different physical principles; in fact the higher the inductances within reasonable limits the better the results, which proves that the method does not depend upon obtaining a

certain value or balance of the inductance reactance and the capacity reactance.

This inductance could be theoretically uniformly distributed, as was attempted by Heavyside, but it becomes practically impossible to do so, or it may be applied at points, provided these points are not too far apart. In other words, there should be several coils per wave length. This is the essential feature of the Pupin invention. Considering the Pupin invention from the purely electrical standpoint, we have only three possible reactions in any electrical circuit: First, resistance reaction; second, inductance reaction; and third, capacity reaction. The resistance reaction is absolutely destructive of energy and causes the attenuation. The inductance and capacity reactions on the other hand do not represent a dissipation of energy excepting so far as resistance is unavoidably present. These reactions, themselves, if free from resistance would represent only the storage of energy without loss. It is evident, therefore, that the loss of energy and the attenuation of the wave are increased by increase of resistance. Inductance, on the other hand, represents no essential loss of energy and the total amount applied to one end of the line would be given out at the other, so far as this reaction is concerned. It is also a fact that it is essential to have stored energy present in order that a wave may be transmitted at all. The energy of the wave is self-contained and each wave or portion of a wave must be carried along by the energy originally applied to form it, since it receives no fresh impulse after once leaving the source of the electromotive force. The energy represented by inductance is equal to $\frac{1}{2}Li^2$; with a large value of L , it is not necessary to have a considerable value of current. This is a great gain, since the loss of energy is entirely due to the resistance and is proportional to i^2 . This is the very secret of the Pupin invention, which enables us to have a considerable amount of energy present by increasing the inductance to a higher value, but keeps the current upon which the loss of energy depends at a small value. The question naturally arises, why not increase the capacity reactance, which also represents a storage of energy and not a loss of it? The answer is that a large capacity gives a small capacity reactance and therefore a large current, and hence increasing the capacity increases also the current and the loss of energy, which is proportionate to the square of that current.

The loading coils, as the added inductances are called, are merely turns of insulated wire wound on very finely laminated iron cores incased in water-tight boxes, which may be mounted on poles if used with aerial lines or if used in cable lines may be placed in manholes. In long overhead lines a coil is generally inserted in series at intervals of $2\frac{1}{2}$ miles; on underground lines at intervals of every 1000 feet. These coils have a resistance of 2.4 ohms and an inductance of about 0.25 henry. The same efficiency of speech transmission can be obtained by loaded lines of the same length as nonloaded ones and with one quarter the weight of copper.

Another factor which has made possible telephonic transmission of speech over very great distances and which compensates for attenuation is the repeater. The function of a repeater as in telegraphy is to break up continuous circuit lengths, thus reduce the capacity

of the line, and at the same time actuate the second section by the impulses impressed upon the first section. These relays must be capable of operating in both directions. Electromagnetic and mechanical repeaters have been attempted in telephony, but they have not proved at all satisfactory. The vacuum repeater similar to that used in wireless telegraphy and

FIG. 10. VACUUM REPEATER. AUDION TYPE.

telephony has been employed with success on the New York-San Francisco line. The form of vacuum repeater which is most widely known is that of the so-called audion type, developed originally by Lee De Forest in 1902. It consists of an evacuated bulb containing a hot cathode, usually a lamp filament heated by the passage of current, an anode in the form of a plate, and a third electrode in the form of a grid or mesh interposed between the cathode *F* and the anode *A*. Fig. 10 illustrates the method of using such a tube for amplifying weak electrical impulses. The operation of the device is as follows: Current from battery *B* heats the filament *F*, which thereupon emits negative ions or electrons. The battery *B* maintains the anode at a potential of 25 volts or more with respect to the filament, so that electrons emitted by the filament pass across the tube to the anode, creating a steady flow of current through the telephone *T*. The value of this current is dependent, among other things, upon the potential of the grid with respect to the filament and it may be varied within wide limits by changing the grid potential. Fig. 11

FIG. 11. CURRENT CURVE IN AUDION REPEATER.

illustrates this characteristic of the tube. It is evident that a negative charge imparted to the grid reduces the plate current while a positive charge increases it. The action of the

system indicated by Fig. 10 when an alternating voltage curve *A* is impressed upon the grid is shown diagrammatically by the curves of Fig. 12; curve *B* shows the pulsating current through the telephone *T*. As the energy required on the input side to operate the repeater is only that which is needed to charge the

FIG. 12. VARIATION IN CURRENT DUE TO CHANGE IN GRID POTENTIAL. AUDION REPEATER.

grid, the ratio of energy output to energy input is extremely large. An amplification of energy of the order of 1000 to 1 is readily obtained. When greater amplification is needed, two or more tubes may be connected in cascade. The use of repeaters of this type on telephone lines is attended with considerable complication and if the amplification is carried too high the line will howl, i.e., the application of too large an amount of energy to the line which is being repeated into will react upon the actuating line and create noises therein, the condition being one of an unstable balance. The principle of the repeater connection for telephonic lines is illustrated in Fig. 13, in which a single tube is shown in a two-way system.

Party Lines. One of the best advance agents of the telephone companies is the party line,

FIG. 13. REPEATER CONNECTIONS IN TWO-WAY SYSTEM.

whereby two or four subscribers are connected to the same circuit, receiving their service at a reduced rate on account of the economy in line conductors. In order to advise which one of the subscribers is wanted when a signal is to be sent from the exchange, different methods of calling have been devised and these have been termed selective and nonselective. On nonselective lines a signal for any party operates the

ringers at all stations, each subscriber having a particular signal or group of periods of bell ringing, which signal he only is meant to answer. This is quite objectionable; for even though one party is called, others on the line hearing the signal may listen in. To avoid this difficulty, selective signals have been devised and in these each station is equipped with a ringer which will respond to its own call, the others remaining silent. Three different principles for party-line selective calls have been devised. These are known as the harmonic, the biased-bell, and the step-by-step arrangements. In the case of the harmonic selective system, each ringer has a spring-supported armature which will respond to but one frequency of current and no other. In the biased-ringer system polarized bells are used with springs connected to their armatures so that they will respond only to currents flowing in certain directions and these are arranged for four-party calls as shown in Fig. 14. The bells

FIG. 14. PARTY-LINE RINGER. BIASED-BELL SYSTEM.

are normally disconnected from the lines, and are only connected when they are to be rung, and then by means of relays inserted in the branches in series with condensers. These relays are operated by alternating currents sent through the circuit by closing the desired ringing key. This connects the bells to the line and when this occurs the desired pulsating current is superimposed upon the proper line side to ring the bell of the selected subscriber through relay contact and ground. Step-by-step party-line systems select the desired subscriber by the operation, one after another, of a set of switches at the subscriber's station by current impulses sent out from the central office.

Automatic Telephone Systems. In automatic telephony the subscribers are enabled to secure intercommunication without the assistance of an exchange operator. Strowger, an electrical engineer and mechanic of Chicago, in 1891, introduced the first automatic telephone system, and shortly afterward several small exchanges were installed. The earliest of his devices were necessarily crude in design, complex in operation, and imperfect in service, but they served to demonstrate the fact that the fundamental principles involved were correct, and that it was possible to evolve a commercially perfect system. After several years of persistent effort and constant experimenting, a system was provided in which the design was so greatly improved and simplified that the resulting exchange was but little more complicated than the ordinary manual switchboard. Another and more recent advance was to extend the limits of the capacity of the device so that the largest city can be handled as conveniently as that of the smallest village. As in the case of the manually operated switchboard, it is difficult to describe in a lucid and brief

manner the mechanism of the operation. The entire system comprises the usual transmitter, receiver, bells, source of energy, and induction coils, but there is also involved a calling dial, at each subscriber's instrument, formed of a metal disk, on the circumference of which are 10 finger holes numbered 1, 2, 3, 4, 5, 6, 7, 8, 9, 0. When a subscriber wishes to make a call he removes the receiver from the hook, when he is connected with the trunk line of the exchange in which are located the connector switches. Assuming, e.g., that the number he wishes is 532, he places his finger in the hole marked 5 and turns the dial around to the stop and then releases it, when it will restore itself, through the action of a spring, to its normal position; similarly, for the following number, he turns the dial to 3 and to 2. This done, he presses a button, when the bell of the subscriber desired is rung and the line closed for conversation. If the telephone of the subscriber called is busy a buzzing sound in the receiver held by the per-

son making the call notifies him of the fact. The automatic switch at the central exchange is a mechanism comprising a pair of relays and three pairs of magnets with their attendant accessories, mounted on a central vertical rod.

These are so arranged that when the electrical impulses are sent from the subscriber's telephone who is calling, wiping or contact fingers, corresponding to the number indicated, are brought into connection with complementary brass contacts which are arranged in semicircular banks, thus selecting the number desired. Among the numerous advantages claimed for the automatic system are, (1) that the subscriber himself connects his telephone with that of the person with whom he wishes to converse, and the apparatus is so constructed that it is impossible for another subscriber to cut in or in any way interfere with the line he is using; (2) that the service which the automatic system gives is, unlike that of the manual system, absolutely secret, each subscriber having a private wire on which to transmit his communication—an advantage that cannot be overestimated by the general business man, as well as by the broker, lawyer, and physician.

Phantom Lines. This method of connecting telephone instruments is frequently employed,

FIG. 15. PHANTOM LINE.

so that two complete metallic circuits may be made to serve three subscribers in place of two. It is accomplished by bridging the lines with repeating coils and connecting the third equipment between the centre points of the coils,

as shown in Fig. 15. The impedance of the coils is so high that it does not short circuit the line across which it is connected, but the current to actuate the middle telephone passes towards the centre of the relay coil and this neutralizes the impedance thereof.

Combined Telephone and Telegraph. Mixed circuits, as these are called, are particularly useful for railway working, as noiseless telephone lines may be obtained from combinations of ordinary telegraph lines. This is accomplished by connecting two lines as shown in Fig. 16. The condensers in the telephone legs shut off the low-frequency telegraphy currents, and the high reactance coils in the telegraphy legs shut out the high-frequency telephone currents. *A* and *B* are terminal telegraph stations and *C* is a way station. The upper line may also serve as a telegraph line, but the instruments are not shown. They would, however, be connected in the same manner as those of the lower line.

Statistics. In 1916 the American Bell Telephone Company did the major portion of the telephone business in the United States, though a number of strong independent companies had been organized. The remarkable growth of the telephone industry since its establishment in the United States is shown in table below, abstracted from the United States Census reports of 1912.

UNITED STATES				
CEN- SUS	Number of systems and lines	Miles of wire	Number of telephones	Estimated num- ber of messages or talks per annum
1912	32,233	20,248,326	13,735,658,245
1907	22,971	12,999,369	6,118,578	11,372,605,063
1902	9,136	4,900,451	2,371,044	5,070,554,553
1890	53	240,412	233,678	453,200,000
1880	148	34,305	54,319
BELL TELEPHONE SYSTEM				
1912	176	15,133,186	5,087,027	9,133,226,836
1907	175	8,947,266	3,132,063	6,401,044,799
1902	44	3,387,924	1,317,178	3,074,530,060
ALL OTHER SYSTEMS				
1912	32,157	5,115,140	3,642,565	4,602,431,409
1907	22,796	4,052,098	2,986,515	3,999,389,159
1902	9,092	1,512,527	1,053,966	1,996,024,493

The marked increase in the business of the independent companies has largely been due to the expiration of the original patents granted to Bell on his receiver and others relating to transmitters. The independent telephone movement began in 1893, but owing to the monopoly of the art held by the Bell companies, the movement progressed very slowly. Prior to the independent movement the Bell Company had paid very little attention to providing rural localities with telephone service, but in recent years the homes of farmers throughout the country have been connected by well-constructed lines and modern instruments.

Public Ownership of Telephones. In European public ownership of telephones exists to a

certain extent and there has been agitation in this direction in the United States. For the most part, such public ownership of telephones is national, rather than municipal, and is chiefly confined to countries where private ownership of franchises is far less common than public ownership. Actual statistics are not readily available, and are constantly changing, but an

FIG. 16. COMBINED TELEPHONE AND TELEGRAPH.

admirable summary of the ownership of telephones in various countries, made by U. N. Bethell, general manager of the New York and New Jersey Telephone Company (see Bibliography below), is as follows:

"All over Europe, with a few exceptions, the industry is controlled and owned by states or municipalities (see table at end of article). In Belgium, France, Switzerland, Germany, Austria, and Hungary the central government operates the industry. In Holland the state operates the trunk lines; in the two principal cities, Amsterdam and Rotterdam, the municipalities operate the local systems; and at The Hague a private company operates. In Denmark and Norway private enterprise under government control operates the industry, while in Sweden the state operates it, except that in Stockholm and vicinity a private company since 1890 has been in active competition with the state. In Great Britain, in most places, private enterprise operates the local systems under license from the state; in a few places municipalities operate or are preparing to operate local systems; the state operates the trunk lines."

Municipal telephone systems were in use or under construction in Great Britain early in 1893 at Glasgow, Portsmouth, Swansea, Brighton, and Hull. The general movement for municipal telephones in Great Britain followed a parliamentary Act of 1899, authorizing municipal construction. Tunbridge Wells and Glasgow, in 1901, were the first to install and operate systems under the Act, but after an active campaign against public ownership in Tunbridge Wells the municipal plant was sold to the National Telephone Company, its private competitor, in the latter part of 1902. It should be added that in 1911 all telephone licenses granted to private companies in Great Britain expired, and in the following year all the lines of the National Telephone Company were taken over by the Post-Office Department, which had had a monopoly of the telegraph business since 1869. See MUNICIPAL OWNERSHIP.

The general question of municipal ownership has been discussed at length under that head. The public interests demand that the business shall be conducted as a monopoly, under public control. Public control does not exist in the

United States to the extent that might be supposed, but that is largely the fault of the legislative and executive departments of the several States, and to some extent of the municipalities also. In many States public-service commissions are empowered to supervise. Finally, the long-distance lines would be a troublesome factor in municipal ownership in America, unless they, as in some countries abroad, were owned by the general government. This has been proposed in some quarters, notably by Postmaster-General Burleson of President Wilson's cabinet.

TELEPHONE, WIRELESS. See WIRELESS TELEGRAPHY AND TELEPHONY.

TELEPHUS (Lat., from Gk. Τηλεφος). In Greek legend, a king of Teuthrania, in southern

Mysia (q.v.). Auge, the daughter of King Aleos of Tegea (q.v.), was loved by Hercules and bore him a son, Telephus. In anger her father inclosed mother and child in a chest and cast them into the sea. The chest floated across the Aegean to the mouth of the Caëus, where Teuthras married Auge and brought up Telephus, who succeeded him on the throne. This early version was modified by the tragedians. Auge became priestess of Athena, and the child was born, or at any rate exposed, on Mount Parthenion, where it was suckled by a doe, and (in one version) found by Hercules. Auge meanwhile was cast into the sea and brought to Mysia, where she was adopted by Teuthras. Later, Telephus came to Mysia on account of an oracle, helped Teuthras against powerful enemies, and was rewarded by the hand of Auge. On the marriage night mother and son recognized each other. When the Greeks were on their way to Troy they landed by mistake in the territory of Telephus and harried the country. Telephus defeated the invaders, but was himself wounded by Achilles. As an oracle informed him that only the man who had wounded him could cure him, he went to Greece, and, as the Greeks needed his guidance to reach Troy, they yielded and Achilles healed the wound with rust from his spear. Telephus then guided the Greeks to Troy but refused to take part in the war, since his wife, Astyoche, was a daughter (or sister) of Priam. The whole story of Telephus was represented on the smaller frieze of the Great Altar of Pergamon (see PERGAMON, GREAT ALTAR OF), and his battle with Achilles in the west pediment of the Temple of Athena Alca at Tegea (q.v.). Consult: Jahn, *Telephus und Troilos* (Kiel, 1841); id., *Telephus und Troilos und sein Ende* (ib., 1859); Pilling, *Quomodo Telephi fabulam et scriptores et artifices veteres tractaverint* (Halle, 1886).

TELESCOPE (from Gk. τηλεσκόπος, *tēle-skopos*, far-seeing, from *τῆλε*, *tēle*, afar + *σκοπεῖν*, *skopein*, to look). Essentially a lens or mirror to form an image of a distant object, together with a microscope to enable the observer to examine this image in detail, or a photographic camera or some form of spectroscopic apparatus. The invention of the telescope was doubtless accomplished in Holland, but there is some confusion and controversy to be encountered in attempting to determine the original inventor. Tradition has it that early in the seventeenth century one Jansen, a spectacle maker of Middelburg, Holland, constructed a telescope about 16 inches long which he exhibited to Prince Maurice and the Archduke Albert, who, appreciating the importance of the discovery, paid him a sum of money to keep it concealed. Another spectacle maker, Lippershey, made application (1608) to the States General for a patent for a telescope, as also did Metius, a professor of mathematics, but in the former instance, at least, it was refused, as the apparatus was already known. It seems certain that the instrument was known more or less about Europe, but the honor of its invention is usually given to Galileo, who was the first to describe it and exhibit it in a complete form (May, 1609). Galileo having heard that a device to magnify distant objects had been constructed in France or Holland, immediately set to work to produce such an instrument. His telescope, similar in form to the modern opera glass (q.v.) and composed of a convex object glass and a

concave eyepiece, as first constructed had a magnifying power of 3 times, but this was subsequently increased to 30 times, and Galileo was able to discover the satellites of Jupiter, the mountains of the moon, and other celestial objects. To Kepler we owe the discovery of the principle of the astronomical telescope with two

verted and is merely magnified by the eyepiece. In what is known as the terrestrial telescope there is an additional lens or lenses added to erect or invert the image so that it will appear to the eye in its natural position, the erecting lens and the eyepiece being in reality a compound microscope to view the image furnished by the

DIAGRAM OF ASTRONOMICAL TELESCOPE.

convex lenses, and the description of such an instrument is contained in his *Catoptrics* (1611). This idea was actually employed in a telescope constructed by Father Scheiner (*Rosa Ursina*, 1630), and such telescopes were used in increasing numbers until the middle of the seventeenth century, when they were practically universal, and improved construction made possible Huygens's discovery of Titan, the brightest satellite of Saturn.

In the accompanying diagram *C* represents a convex lens, the object glass of a telescope; *A* is a distant object and *B* is a real and inverted image formed by the lens. From the discussion of lenses in the article on *LIGHT* (q.v.) it will appear that in order to obtain a large image a lens of long focal length is essential, so that for a telescope an object glass with large radii of curvature is needed. This, however, is not feasible in actual practice beyond a certain point, as was found by the early astronomers after experiences with telescopes having focal

objective. In the diagram *C* is the object glass, *B* is the inverted image formed by the rays coming from a distant object in the direction *A*, *E* and *G* serve merely to invert the image *B* and form it anew and erect at *H*, where it is observed by the eyepiece *D*.

Other arrangements of the terrestrial eyepiece could be mentioned, but the one described is one of the earliest and simplest.

While the greatest care must be expended on calculating and constructing the object glass, the eyepiece is by no means unimportant. As the magnifying power of the telescope (the ratio of the angles formed by lines drawn to the extremities of the image and the object) is equal to the quotient obtained by dividing the focal length of the objective by that of the ocular, it would be of advantage to use a lens of comparatively large curvature; but here again chromatic and spherical aberration must be considered, for sharpness and distinctness are as essential as high magnification. In practice

DIAGRAM SHOWING TERRESTRIAL TELESCOPE.

lengths as great as 600 feet; and lenses of shorter focal length but of improved construction were adopted. The next question involved is the size of the object glass, technically called its aperture. The larger the lens the greater will be the amount of light transmitted. The pupil of the eye through which the light producing an image passes normally is about $\frac{1}{8}$ of an inch in diameter, consequently as much more light will pass through the telescope as the square of the diameter of the object glass is times greater than the square of the diameter of the pupil. But if the image formed is too large, then the light will be distributed and the image will lack brilliancy and not be plainly visible. Taking these facts into consideration, it would appear that the greater the focal length of the lens and the greater its surface, the more satisfactory would be the image produced. This would be the case were it not for the fact that both spherical and chromatic aberration (q.v.) increase with the aperture of a lens, and that the larger the piece of glass, the greater the difficulty of securing homogeneity and freedom from imperfections. Increasing the focal length increases the difficulties involved in mounting the telescope as well as in the manufacture of the objective itself.

The image furnished by the object glass is in-

verted and is merely magnified by the eyepiece. Generally they consist of two achromatic lenses, one convex, known as the field lens, which brings together the outer rays of the beam, while the lens nearest to the eye may be either positive (convex) or negative (concave). In case a micrometer is used to measure the image a positive lens is employed and the combination, which is known as a Ramsden eyepiece, though not quite achromatic, has a flat field. For mere observation the Huygenian eyepiece, with a negative lens of one-third of the focal length of the field lens, is preferable. The addition of lenses to the eyepiece diminishes the supply of light and destroys the brightness of the image. Accordingly in the terrestrial telescope, while the erecting lens inverts the image to its proper position, yet the image is not as bright as in the case of the opera glass, which has far less magnifying power.

The difficulties due to spherical aberration were early experienced by opticians and astronomers, and in an attempt to obviate them astronomical telescopes were constructed of considerable focal length and power. From observations made with such instruments by Huygens, who was the pioneer in this line, he was able to

present the first explanation of Saturn's rings (1659). He constructed a telescope 300 feet in length, which magnified 600 times, while the telescope used by Cassini to discover the fifth satellite of Saturn (Rhea) was built by Campani of Rome and magnified about 150 times. The diameter of Venus was determined in 1722 by Bradley with a telescope of 212 feet focal length. These telescopes of extreme length were known as aerial telescopes, and naturally their mounting and manipulation presented many difficulties. In spite of these awkward conditions, valuable observations were made and ingenious appliances introduced to facilitate the operations. It was proposed by Prof. David P. Todd as late as 1911 to construct a long-focus open-air telescope of steel box-girder construction so reinforced as to be unyielding and rigid. With this it was hoped to cut down spherical aberration just as was done by the earlier astronomers and secure the advantages of long-focus lenses under modern conditions.

The invention of the achromatic object glass by Dollond in 1757-58 and the improvement of optical flint glass, which commenced in 1754, soon made possible the construction of improved telescopes; but these were all of modest dimensions, and until well into the nineteenth century few if any object glasses were constructed greater than 12 inches in diameter. The discovery of methods of making large disks of flint glass was made by Guinand, a Swiss mechanic, who then became associated with Fraunhofer (q.v.), and telescopes as large as 10 inches aperture were readily made. His successors made instruments with object glasses 15 inches across. The next successful manufacturer of telescope lenses was Alvan Clark (q.v.), of Cambridgeport, Mass., who, from the time when an object glass manufactured in his shop was purchased by the Rev. W. R. Dawes of England, gradually achieved the highest rank as a maker of telescope lenses. With him was associated his son Alvan G. Clark (q.v.). At the Cambridgeport works were constructed the lenses not only for the leading American observatories, but also for the Imperial Russian Observatory at Pulkova and other European institutions. To-day there are other makers of refracting telescopes in the United States, notable among whom are Brashear, Warner, and Swazey, while in Europe, Grubb of Dublin, Henry Brothers of Paris, and Steinheil in Germany are notable for their work.

The formation of an image by a concave mirror has been made use of in the reflecting telescope, of which numerous varieties have been devised and with which many of the most important astronomical discoveries have been made. The principle of this instrument will be apparent from the following diagram and explanation:

DIAGRAM SHOWING FORMATION OF AN IMAGE BY A CONCAVE MIRROR.

C is a concave mirror on which rays from a point of a distant object, *A*, fall. Following the law of reflection, these rays will be reflected and will be united at *B*, the focus for rays from the given point. The object *A* is made up of a num-

ber of such points; consequently at *B* there will be a number of points where the rays from *A* are collected and an image of the original object will be formed. If the rays come from an object infinitely distant, or in other words are parallel, they will converge at the principal focus, which is one-half of the radius of curvature. This will be the case in a mirror of large radius and for rays that are incident, not far from the axis; but if the mirror is large, then the rays near its circumference will not be brought to a focus at the point *B*, but nearer to the mirror, and consequently a blurred image will be produced. This is known as spherical aberration and is discussed under that head. Theoretically this could be remedied by the construction of a mirror of parabolic section, as the configuration of such a mirror is such that all parallel rays are brought to a focus in the same point. This is extremely difficult of attainment, as the most minute amounts of material must be removed from a spherical surface in order to make it parabolic; nevertheless, modern opticians, by refinements in working and testing, are able practically to realize this condition. When an image is formed in this way it can be viewed either by being received on a screen or it can be observed with an eyepiece or a simple microscope.

Father Zucchi, an Italian Jesuit, was the first to use an eye lens to view the image produced by a concave mirror (1616-1652), but to Gregory is due the first description of a telescope with a reflecting mirror, and the instrument has since been known by his name. Gregory (1638-75), with others, realized the shortcomings of a telescope with lenses and believed that the manufacture of concave mirrors would be attended with far less difficulty. An actual working instrument based on this principle was devised and constructed by Isaac Newton. With a telescope formed by a mirror of $6\frac{1}{2}$ inches focal length, which magnified 38 times, he was enabled to make important observations. In these telescopes the great difficulty was viewing the image, as the eyepiece and the head of the observer would cut off a large portion of the incident rays. In the Gregorian telescope this was obviated by the interposition of a second concave mirror, which reflected the rays to the eyepiece, as is shown in the following diagram:

GREGORIAN TELESCOPE.

Newton used a plane mirror placed at an angle of 45° to the axis, which reflected the rays into an eyepiece arranged as in diagram below.

NEWTONIAN TELESCOPE.

Draper used a total reflection prism instead of the plane mirror with considerable success, being one of the few astronomers in the United

States to construct a reflecting mirror. Cassegrain employed a convex mirror instead of a concave one.

Herschel obtained satisfactory results by tilting his mirror and placing the eyepiece below the axis of the instrument, so that it was not in

HERSCHEL'S TELESCOPE.

the way of the incident rays. Herschel's mirrors were as large as 4 feet in diameter, with a tube 40 feet in length.

The reflecting telescope was extensively used because there was no chromatic aberration caused by refraction. Spherical aberration was, however, present and was a serious drawback. According to geometrical calculations, as has been said, there would be no spherical aberration if a parabolic mirror was used, as all the rays from a distant object would come to a focus at one point. The grinding of a parabolic mirror, however, was attended by many difficulties and was practically impossible except to a few opticians.

The mirrors for reflecting telescopes were usually made of speculum metal, which is composed of a mixture of copper and tin, until Liebig discovered the method of depositing a film of silver on a glass surface.

The use of silvered glass for mirrors was suggested by Steinheil, and later by Foucault, and has met with general adoption, as it not only facilitates the construction of the mirror, but makes possible its resilvering at any time without the destruction of its configuration. The reflecting telescope is available for photographic or spectroscopic work, as well as for visual observation, but the chief defects, as mentioned, are the difficulty of grinding the metal or glass to true parabolic shape and the deformation of the mirror in its mounting, owing to its great mass.

For many years the most celebrated reflecting telescope was that of Lord Rosse, whose mirror was 6 feet across. This was completed in 1845 and erected at Birr Castle, Parsonstown, in Ireland. While famous for its size, except for studies of the spiral form of nebulae this telescope has never been used in making discoveries of prime importance. In 1914 it was presented to the South Kensington Museum of Science as an historic relic. Of much greater scientific importance as well as of large size are the reflectors of Harvard College, Mount Wilson Solar Observatory, and the Canadian Observatory near Victoria, British Columbia. The Harvard College reflector belonged originally to the late Dr. A. A. Common of Ealing, England. Using the largest glass disk that could be obtained, 5 feet in diameter, Dr. Common produced a perfect mirror, which is mounted equatorially. This telescope is of the Newtonian type and has been particularly useful in celestial photography.

In recent years an important use was made of a reflecting telescope to photograph the nebulae with the 3-foot Crossley reflector of the Lick Observatory (q.v.). This instrument was made by Dr. A. A. Common and was presented to Lick Observatory by Edward Crossley. Prof. James T. Keeler, the director, remounted this

instrument and in 1899 made a remarkable series of photographs which indicated the formation and general character of the nebulae.

This work was followed by some notable researches at the Mount Wilson Solar Observatory, where there were installed the largest reflecting telescopes yet to be constructed. These were employed both photographically and spectroscopically for the study of the sun, stars, and nebulae. The first of these telescopes was the 60-inch reflector, made from a plate of glass 8 inches in thickness and weighing 1 ton. The glass was cast at the French Plate Glass Works of St. Gobain, but the disk was ground and polished at the shop of the Mount Wilson Observatory. This instrument was completed in 1908, and it and its mounting proved most satisfactory, especially for photographic and spectroscopic work. With an 80-foot Cassegrain combination this telescope was effectively used in the determination of stellar parallax. The success of the 60-inch telescope led to the desire for a still larger reflector and the construction of one of 100 inches in diameter was attempted, a suitable disk of glass 20 centimeters in thickness being secured after great trouble at the French works at St. Gobain. This was properly ground and figured and the 60-inch plane mirror required for its testing made at the instrument shop of the Mount Wilson Observatory at Pasadena. The mounting for this telescope required the most refined mechanical engineering in order to support and move the heavy disk of glass, and it was found that by proper control of the temperature of the mounting that much of the distortion could be eliminated.

The new reflector of the Dominion Observatory, near Victoria, British Columbia, has a mirror 6 feet, 1 inch in diameter, weighing almost 2 tons. It was made by John A. Brashear Company of Pittsburgh and is supplied with an equatorial mounting. This telescope and observatory were reaching completion in 1916.

The mounting of telescopes has also kept pace with the improvement of lenses and mirrors. Newton used a ball and socket joint to mount his small reflector, and then various arrangements of framework were employed for the aerial telescopes and later for the large reflectors. The first equatorial (q.v.) mounting is ascribed to Lassel. In England telescopes were mounted by having the polar axis supported at each end, but the German system, where the mounting is in the centre and the weight of the telescope is balanced by counterpoises, is now generally used for large refractors, and a modified form is employed for reflectors, as shown in the accompanying plate.

The modern telescope is not merely an instrument for visual observation, but in connection with photography and the use of the spectroscopic (q.v.), especially in its adaptation to the spectroheliograph and other kindred instruments, its field has been widely increased. Fraunhofer, who first used the spectroscopic instead of the visual eyepiece, was able to record the spectra of Venus and Sirius, and since that time the combination of telescope and spectroscopic has made possible some of the most important advances in astronomy. One of the earliest applications of photography was to the heavens, and the object glass of the telescope was used with the eyepiece removed, the image being formed directly on the plate. In the early

inches in thickness, and weighed 3600 kilograms (nearly 8000 pounds). So far as is known this telescope never was entirely completed for scientific observations, though used by visitors at the Exposition.

The telescope with fixed tube, as used in the more or less extemporized arrangements of the transit of Venus expedition of 1882, and in the uncompleted instrument of the Paris Exposition, however, developed into a series of interesting and valuable instruments at the Mount Wilson Observatory, especially in connection with the photographic study of the sun and with the spectrograph and spectroheliograph as well as with other work. Instead of the siderostat a celostat, a similar device, but with a second mirror, was employed, where the movable plane mirror made a complete revolution but once in 48 hours and reflected its beam into a second plane mirror, whence it was reflected to the telescope proper, which may be either a reflector or a refractor. The Snow reflector of the Mount Wilson Observatory is a horizontal reflector provided with mirrors that will give an image of the sun either 6.7 inches in diameter or 16 inches in diameter. The first of these mirrors is of 60 feet focal length and the second of 143 feet. The celostat is mounted on a masonry pier, and the instrument is protected by a ventilated covering which keeps off the direct rays of the sun. This horizontal telescope can be used either directly, or with the spectroheliograph, for photographing the sun. In addition to the horizontal telescope, there are at Mount Wilson two vertical or tower telescopes, one carried on a 60-foot tower and used with a 30-foot spectrograph and spectroheliograph, and the other on a 150-foot tower with a 75-foot spectrograph and spectroheliograph. In these two telescopes the celostat is mounted at the summit platform and the beam is reflected down vertically through a lens. These telescopes have various lenses for special purposes, varying in focal length, as needed. The vertical tubes of the two telescopes have a double sheathing of metal, and chambers, or wells, excavated in the solid rock on which the towers are founded afford constant temperature for the mirrors, prisms, and gratings of the spectroscopes.

See ASTRONOMY; OBSERVATORY; LIGHT; MOUNT WILSON SOLAR OBSERVATORY; SPECTROGRAPH; ETC.

TEL/ESCRIBE (from Gk. *τῆλε*, *tēle*, afar + Lat. *scribere*, to write). An invention of Thomas A. Edison brought out in 1914 to record permanently on a phonograph a conversation carried on over a telephone line. The apparatus operates by placing the ordinary telephone receiver on the box of the telescribe in proximity to the receiving diaphragm of a loud-speaking tele-

phone transmitter whose vibrations are transmitted to the receiving diaphragm of a dictating machine or phonograph. There is also a watch-case receiver connected with the telescribe and the telephone line which is used by the hearer. The vibrations of the diaphragm in the telephone receiver when placed on the telescribe transmitter are duly transmitted to the recorder of the talking machine or phonograph. When the telephone receiver is placed on the telescribe box an automatic switch is operated and the talking machine is put in operation recording the conversation. It is possible to record only as much of the conversation as the hearer desires, and at the same time every word that is spoken in the ordinary use of the telephone can be heard. The record made on the telescribe can be repeated as often as desired and the instrument was thought to be an important adjunct to the practical use of the telephone.

TEL/ESIL/LA OF AR/GOS (Lat., from Gk. Τηλέσιλλα) (c.510 B.C.). A Greek poet. She was born at Argos and is said to have served in the Argive army against Sparta. Her lyrics are lost except for two lines found in Bergk's *Poetae Lyrici Graeci*, vol. iii (5th ed., Leipzig, 1914).

TELESIO, tē-lā'zyō, BERNARDINO (1609-88). An Italian philosopher, born at Cosenza near Naples. He studied at Rome and Padua, lectured for a time at Naples, and later founded the Academy of Cosenza. Teslio headed the great southern Italian revolt against the mediæval Aristotelianism, thus paving the way for more scientific methods of thought. His greatest work, *De Rerum Natura* (new ed., 2 vols., 1910-13), appeared at Rome in 1565. His psychology was of rationalistic tendency. After his death his works were placed on the Index by the church. Consult Bartholmess, *Dissertatio de B. Teslio* (Paris, 1849).

TELETS (tē-lēts') LAKE. See ALTIN.

TELEU/TOSPORE. The winter spore of rusts. See UREDINALES.

TELFORD, JOHN (1851-). An English Wesleyan Methodist clergyman and editor, born at Wigton, Cumberland. He graduated from Didsbury College in 1873, entered the ministry, and was elected to the Legal Hundred in 1906. From 1905 he was editor of the *Wesleyan Methodist Magazine* and connectional editor, and he published: *Life of John Wesley* (1886; new ed., 1910); *A History of Lay Preaching in the Christian Church* (1897; 2d ed., 1912); *A Popular History of Methodism* (3d ed., 1899); *A Sect that Moved the World* (1907); *Man's Partnership with Divine Providence*, the Fernley lecture of 1908; *The Life of James Harrison Riggs* (1909). Telford edited *Wesley's Veterans* (5 vols., to 1913).

TELFORD, THOMAS (1757-1834). An eminent Scottish engineer, born in Eskdale, Dumfriesshire. At the age of 14 he became a stonemason. In 1780 he removed to Edinburgh, and in 1783 he repaired to London, where he was appointed in 1784 to superintend the erection of the resident commissioner's house at Portsmouth dockyard. In 1787 he was appointed surveyor of public works for Shropshire; and his two bridges over the Severn at Montford and Buildwas and other works gained for him the planning and superintendence of the projected Ellesmere Canal, to connect the navigation of the Severn, Dee, and Mersey (1795-1805). In 1801 he was retained by the government to

report on desirable public works for Scotland. As a consequence, the plan of a canal from Inverness to Fort William was revived, and its planning and construction intrusted to Telford. (See CALEDONIAN CANAL.) He constructed more than 1000 miles of road in the Highlands, Lanarkshire, and Dumfriesshire and about 1200 bridges, besides churches, manse, harbors, etc. He superintended the construction of the road from London to Holyhead, including the erection of numerous bridges—among others, the Menai Straits suspension bridge. His life, entitled *The Life of Thomas Telford, Civil Engineer, written by himself*, was published in 1838. In America Telford is chiefly known for the system of road construction that bears his name. Consult Samuel Smiles, *Lives of the Engineers*, vol. iii (new ed., New York, 1905). From its foundation in 1818 he served as president of the Institution of Civil Engineers, which body awards a Telford gold medal. See ROAD.

TELFORD ROAD. See ROAD.

TEL'HARMONIUM (Neo-Lat., from Gk. *τῆλε*, *tēle*, afar + *ἁρμονία*, *harmonia*, joint, concord, harmony). The name applied by the inventor, Dr. Thaddeus Cahill, to a device for the production of music at any distance from the performer, by means of electric currents. The fundamental idea involved in Cahill's system is the combination at will of alternating currents of any frequency and amplitude, thereby producing a current having a wave shape of the form corresponding to any musical note of any timbre. This composite current, if allowed to pass through a telephone receiver, will then cause the diaphragm to vibrate, producing a sound wave corresponding exactly to the current wave. The sources of current are a number of small alternators, each alternator producing a sine-wave current of a definite frequency. The keyboard is similar to that of an organ; the keys operate switches so as to bring the several alternators into action on the lines or mains as required. The notes produced are of remarkable purity, being surpassed only by that of a good string. The performer has absolute control over the notes, both as to expression and timbre; he can produce at will the note of practically any instrument, and even notes of an entirely new quality. Since any number of receivers can be connected to a single keyboard, it is possible for a single performer to be heard in practically any number of places at one time, and a distribution system was planned whereby music could be transmitted to a large number of subscribers. Daily concerts with an approved programme in this way would be available.

TELINGS, *tē-lingz'*, or **TELINGAS**, *tē-līp'-gāz*. See KLINGS; TELUGUS.

TELL, WILLIAM. The hero of a Swiss legend, in its main features common to all Aryan peoples. It is found in the Icelandic *Thidrek-saga*, in Saxo Grammaticus, in old English ballads, in Persian poetry, and elsewhere. All tell of a master marksman and of a tyrant who compels him to pit faith in his skill against his natural instinct as a father. The Swiss legend, narrated with much circumstance, is that a mythical Austrian bailiff, Gessler, demanded homage to the cap of Austria (1307) in the market place at Altdorf. Tell refused this, was condemned to death, but permitted to ransom himself by shooting an apple from his son's head. On signifying his intent to have killed

Gessler if he had shot his son, Tell was fettered and carried to the bailiff's boat. A storm arose and Tell was released that he might save the boat. This he did, then leaped ashore, and killed Gessler. The story then speaks of a revolt in which Tell takes part and by which the Forest Cantons gain independence. The oldest chroniclers know nothing of the tale. It appears timidly, late in the fifteenth century, in *Das weisse Buch*, and more boldly in Tschudi's *Chronicon* (c.1550). The most famous version of the story is Schiller's drama *Wilhelm Tell* (1804). Consult: Rothe, *Die dramatischen Quellen des Schillerschen Tell*, in "Forschung en zur deutschen Philologie" (Leipzig, 1894); Ferdinand Schmidt, *William Tell*, Eng. trans. G. P. Upton (Chicago, 1904); and for historical criticism of the saga, E. L. Rochholz, *Tell und Gessler* (Heilbronn, 1877).

TELL CITY. A city in Perry Co., Ind., 53 miles by rail east of Evansville, on the Ohio River, and on the Southern Railway (Map: Indiana, D 9). There are chair, desk, and furniture factories, a woolen mill, and a foundry. Tell City was founded by the Swiss Colonization Society in 1857. Pop., 1900, 2680; 1910, 3369.

TELL EL AMARNA, *tēl ēl ā-mār'nā*. A place in Middle Egypt, on the right bank of the Nile, about midway between Thebes and Memphis. It includes the Arab villages Hagg-Kandil and Et Tell and is the site of the ancient city of Akhetaten, founded by the heretic King Amenophis IV (q.v.), also known as Akhenaten, who abandoned Thebes and removed his residence thither. A splendid temple and palace were built, and the city increased so fast that it extended to the opposite bank of the Nile; but its existence was brief. After the death of Amenophis and the triumph of the orthodox religion, the royal residence was transferred to Thebes and the new city rapidly fell into decay. The ruins of the temple and palace are to be seen, and in the vicinity are interesting rock-hewn tombs, constructed for the courtiers of the royal founder of the city. In the winter of 1887-88 the archive chamber of Amenophis was discovered by some natives, and in it were found a number of cuneiform tablets containing the correspondence of the King and of his father, Amenophis III, with the governors and kings of western Asia. (See AMARNA LETTERS.) The site was explored by Petrie in 1891-92. Consult: W. M. Flinders Petrie, *Tel el-Amarna* (London, 1895); N. de G. Davies, "Rock Tombs of El Amarna," in *Archaeological Survey of Egypt, Memoir, 13-18* (6 vols., ib., 1903-08); Baedeker, *Egypt* (7th ed., Leipzig, 1914).

TELL EL KEBIR, *tēl ēl kā-bār'*. A village of northeastern Egypt, on the Sweet Water Canal, 18 miles east by south of Zagazig, noted as the scene of a battle between the English under Lord Wolseley and the Egyptian insurgents under Arabi Pasha (q.v.), Sept. 13, 1882. See EGYPT.

TELLER, HENRY MOORE (1830-1914). An American politician and cabinet officer, born at Granger, N. Y. He was educated at Alfred University, was admitted to the bar in 1856, in 1858 removed to Illinois, and in 1861 to Colorado. He was a Republican member of the United States Senate from 1876 until April, 1882, when he entered the cabinet of President Arthur as Secretary of the Interior. At the close of Arthur's administration he again entered the Senate and was reelected in 1890 as a

Republican. A strong advocate of free silver, with 33 others he left the Republican national convention in 1896, having broken with the party on this question as early as 1893. In 1897 he was returned to the Senate as an independent Silver Republican, and in 1902 was re-elected as the regular Democratic nominee. He retired from the Senate in 1909.

TELLER, WILHELM ABRAHAM (1734-1804). A German Lutheran theologian, born at Leipzig. In 1761 he became pastor, general superintendent, and professor of theology at Helmstedt. His *Lehrbuch des christlichen Glaubens* (1764) aroused a storm of disapproval by its strong rationalistic doctrines. In 1767 Teller became supreme consistorial counselor and provost of Kölln at Berlin, where he was elected to the Academy of Sciences. Among his notable writings was *Die Religion der Vollkommenen* (1792).

TELLEZ, tē'yāth, GABRIEL (c.1571-1648). A Spanish cleric, prose writer, and dramatist, known under the pseudonym of Tirso de Molina. He was well known as a comic playwright before 1610. At his death he was prior of the monastery at Soria. His best tales, and some of his best plays, are contained in the miscellaneous collection entitled *Cigarrales de Toledo*, licensed in 1621, but apparently not published until 1624. A second collection is the *Deleitar aprovechando* (1635). Eighty-six plays are extant, although he is known to have written more than 400. The *Burlador de Sevilla*, the first work of great merit to bring Don Juan on the boards, has long been attributed to Tellez. To him we owe also a splendid treatment of a profound philosophical enigma in *El condenado por desconfiado*. He was also a master in the handling of historical subjects (*La prudencia de la mujer*) and of witty dialogue and intricate intrigue (*Don Gil de las calzas verdes* and *El vergonzoso en palacio*). Consult his *Teatro escogido*, edited by Hartzenbusch (12 vols., Madrid, 1839-42); his *Comedias escogidas*, also edited by Hartzenbusch, in the *Biblioteca de autores españoles*, vol. v (4th ed., ib., 1903); and the *Comedias de Tirso de Molina*, edited by Emilio Cotarelo y Mori in the *Nueva biblioteca de autores españoles*, vols. iv and ix (ib., 1906-07), with a good biography and an analytical catalogue of Tirso's plays. See also Ramón Menéndez Pidal, *El condenado por desconfiado* (Madrid, 1902, and in the *Bulletin hispanique*, Paris, 1904); Alfred Morel-Fatio, "La prudence chez la femme: drame historique de T. de M.," in *Etudes sur l'Espagne* (3d series, Paris, 1904); Victor Said Armesto, *La leyenda de Don Juan* (Madrid, 1908); Blanca de los Rios de Lampérez, *Del Siglo de oro* (ib., 1910); and Theodor Schröder, *Die dramatischen Bearbeitungen der Don Juan-Sage* (Halle, 1912).

TELLEZ-GIRÓN, PEDRO. See OSUNA, P. TELLEZ-GIRÓN, third DUKE OF.

TEL'LICHER'RI, or TEL'LICHER'RY. A seaport in the District of Malabar, Madras, India, 90 miles south by east of Mangalore, on the Arabian Sea (Map: India, C 7). Pop., 1901, 27,883; 1911, 29,372.

TELLIER, tē'yā', CHARLES (1828-1913). A French engineer, born in Paris. He early made a study of motors and compressed air. In 1868 he began experiments in refrigeration, which resulted ultimately in the refrigerating plant as used on ocean vessels, to preserve meat and other perishable food. In 1911 Tellier was awarded

the Joest prize by the French Institute and in 1912 he was made Chevalier of the Legion of Honor. He wrote *Histoire d'une invention moderne. le frigorifique* (1910).

TELLIER, FRANÇOIS MICHEL LE. See LOUVOIS, MARQUIS DE.

TELLURIDE. A city and the county seat of San Miguel Co., Colo., 45 miles south of Ridgway, on the San Miguel River and on the Rio Grande Southern Railroad (Map: Colorado, B 4). The city is situated in the Rocky Mountains at an altitude of 8756 feet. Mining is the principal industry. The average annual production in gold, silver, lead, and copper is \$6,500,000, chiefly in gold. Pop., 1900, 2446; 1910, 1756.

TELLURITE. A mineral tellurium dioxide crystallized in the orthorhombic system. It has a subadamantine lustre, and is of a yellowish-white or yellow color. It occurs as an incrustation with native tellurium in Transylvania and at various localities in Boulder Co., Colo.

TELLURIUM (Neo-Lat., from Lat. *tellus*, earth). A nonmetallic element discovered by Reichenstein in 1782, but first isolated by Klaproth in 1798. The element is found native in small quantities at various localities in Hungary, Transylvania, Virginia, and California. It is also found as tellurium dioxide or tellurite, as silver and gold telluride or sylvanite, as bismuth telluride or tetradymite, and in the form of other minerals, of more complex composition. It may be prepared by cautiously heating tetradymite with potassium carbonate and charcoal in a covered crucible, extracting the resulting potassium telluride (K_2Te) with water free from air, and then passing a current of air through the solution, the metal being thus deposited in the form of a powder.

Tellurium (symbol, Te ; atomic weight 127.5) is a white shining, crystalline, brittle solid that has a specific gravity of 6.27, and melts at $452^\circ C.$ ($846^\circ F.$). Like selenium, which it greatly resembles, it exists in amorphous and crystalline modifications, the conversion of the former into the latter being accompanied by an evolution of heat. There is also an increase of electric conductivity under the influence of light, though not so marked as in the case of selenium. Tellurium combines with oxygen to form a monoxide (TeO), a dioxide (TeO_2), and a trioxide (TeO_3), the last two of which combine with water to form tellurous and telluric acids (H_2TeO_3 and H_2TeO_4 , respectively), which in turn yield series of salts called respectively tellurites and tellurates. Hydrogen telluride (H_2Te) is an evil-smelling, inflammable gas similar to hydrogen sulphide in its chemical behavior. For a remarkable anomaly exhibited by tellurium see PERIODIC LAW.

TELLUS (Lat., earth), more commonly **TELLUS MATER**, and, later, **TERRA MATER**. The Roman goddess of the fields, who, as coworker with Ceres (q.v.), brought to maturity the seed. At her festival in January, cakes were offered to her, a pregnant sow was sacrificed, and prayers were offered to her for the protection of the seed from bird and beast and disease. Consult W. W. Fowler, *Roman Festivals* (London, 1899); Georg Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912). See **GÆA**.

TELMANN, KONRAD. See ZITELLMANN, KONRAD.

TELPHERAGE (from *telpher*, from Gk. $\tau\eta\lambda\epsilon$, *tēle*, afar + $\phi\acute{\epsilon}\rho\epsilon\upsilon$, *pherein*, to bear). A

form of cableway transportation (see **CABLEWAY**) in which the supporting grooved-wheel trolleys or trucks are equipped with electric motors, so that each unit is self-propelling. The trolley, or telpher, as it is usually called, is supplied with current by an independent wire apart from the supporting aerial cable, and the current may be controlled by switches at points along the line either by an operator, or the switches may be made automatic and be operated by the passing of the car with its load. Telpherage is used in quarries or mineral storage plants, for loading and unloading, and in warehouses. It has the advantage over haulage systems that the mass of actuating haulage wire does not have to be supported and guided as well as kept in motion.

TELUGUS, tēl'ō-gōōz, or **TELINGAS**. The northeastern division of the Dravidian family, numbering over 23,000,000. They present the typical aspect of the race—medium-statured, mesocephalic to dolichocephalic in head form. The Yanadis of Nellore, considered by some authorities to be the primitive Telugus, both with respect to physical characteristics and general culture status, are markedly dolichocephalic, broad-nosed, short-statured, and dark-skinned. The castes of the Telugus, adopted through Hindu influence, run down from the Brahmans to the despised Madigas, who are leather workers. Other divisions are the Palayakkarans and Tottlyans (cultivators); the Komatis (traders), who have their sacred book, the Kanyakapuran; the Boyas (hunters); the Bestas (hunters and fishers). Hinduism has largely, even among such primitive tribes as the Yanadis, superseded the old animistic religion of the Telugus. About the middle of the sixth century some of the Telugus made their way into Ceylon.

In its linguistic structure Telugu coincides in the main with Tamil, although it differs widely from its older cognate in phonology and vocabulary, which is strongly influenced by Sanskrit. The literature, which is outlined under the title **DRAVIDIANS**, is abundant and of much stylistic merit.

H. Arden, *Progressive Grammar of the Telugu Language* (2d ed., Madras, 1906); Edgar Thurston, *Castes and Tribes of Southern India* (ib., 1909); L. D. Barnett, comp., *Catalogue of the Telugu Books in the British Museum* (London, 1912); R. Caldwell, *Comparative Grammar of the Dravidian or South Indian Family of Languages* (3d ed., ib., 1913); J. Clough, *Social Christianity in the Orient* (New York, 1914).

TEMBULAND. One of the Transkeian territories of the Cape of Good Hope Province. It is situated south of East Griqualand and has an area of 4129 square miles. Population according to the census of 1911: total, 236,080; white, 8138; colored, 227,948; females, 127,211. Tembuland was annexed to the Cape Colony Aug. 26, 1885.

TÉMÉRAIRE, tā'mā'rār', **THE**. A French battleship captured by the English in the battle of the Nile in 1798. In 1805 she took part in the battle of Trafalgar and was destroyed in 1838. The "Fighting *Téméraire*" (1839), a painting by J. M. W. Turner (q.v.), hangs in the National Gallery, London.

TEMESVÁR, tēm'esh-vār. A royal free city and capital of the county of Temes, Hungary, on the Béga Canal, 62 miles southeast of Szegedin (Map: Hungary, G 4). It consists of an outer and an interesting inner town or fortress. There are a Roman Catholic cathedral built by Marie Theresa, a Greek cathedral, immense barracks, and an arsenal (the castle built by Hunyady in 1442). The commander's palace, the Greek Orthodox Bishop's palace, and a Gothic column (40 feet high), by Max, erected to the memory of the town's defenders of 1849, are among the noteworthy structures. There is a museum of art, natural history, and antiquities. The town has a royal tobacco factory and manufactures cloth, matches, fertilizers, paper, and leather. Temesvár became a town in the thirteenth century. It was destroyed by the Tatars in 1242. From 1552 to 1716 it was held by the Turks, from whom it was taken by Prince Eugene. In 1849 it successfully resisted the attack of the Hungarian insurgents under Vécsey. On Aug. 9, 1849, the Hungarians under Bem and Dembinski were defeated near Temesvár by the Austrians under Haynau. Pop., 1900, 59,229; 1910, 72,555, mostly German Catholics.

TEMME, tēm'me, **JODOCUS DONATUS HUBERTUS** (1798-1881). A German criminologist, politician, and novelist, born at Lette, Westphalia. He studied law at Münster and Göttingen, and became vice president of the Provincial Court of Appeals at Münster in 1848. His attitude as a leader of the Extreme Left in the Prussian as well as in the German National Assembly involved him in a trial for high treason, and, although acquitted, he was dismissed from government service in 1851. In the following year he accepted the professorship of criminal law at Zurich. He was best known as the author of more than 150 novels and stories, artistically of little importance, dealing with criminal schemes, among them: *Deutsche Kriminalnovellen* (1858-59), *Kriminalnovellen* (10 vols., 1860-64), *Dunkle Wege* (1862), *Schwarzort* (1863), *Die Heimat* (1868), and *Die Generalin* (1877). Consult S. Born, *Erinnerungen von J. D. H. Temme* (Leipzig, 1892), and A. Lichtenstein, *Der Kriminalroman* (Munich, 1908).

TEM'PE (Lat., from Gk. Τέμπε). A narrow mountain delf, about four and a half miles long, in the northeastern part of Thessaly, between the precipitous sides of Mount Olympus (q.v.) and Ossa (q.v.), through which the river Peneus rushes to the Gulf of Saloniki. At places the rocky walls retire, leaving room for little glades and openings. Tempe was celebrated as one of the favorite haunts of Apollo. It was from the earliest times noted for its beauty and picturesqueness and was constantly praised in song. The name finally came to be applied to any beautiful and sequestered vale.

TEMPELTEY, tēm'pel-tē, **EDUARD VON** (1832-). A German dramatist, born in Berlin. He studied at the University of Berlin, and subsequently took up journalism. In 1862 he entered the service of the Duke of Coburg. Among his other duties was the superintendence of the court theatre. He was the author of several dramas, popular in their day, among them *Clytemnestra* (1857) and *Cromwell* (1883).

TEMPERA (It., from Lat. *temperare*, to proportion, modify), or **DISTEMPER**. In its original sense tempera signifies any fluid medium with which pigments may be mixed; but the term is usually restricted to a glutinous medium,

such as egg, size, or gums, as distinguished from oil; and especially to that in which the yolk of eggs is the chief ingredient. Various mediums have been used, such as the juice of young sprouts of the fig tree, vinegar, and honey. Tempera differs from fresco in that the pigments are not applied to the fresh plaster, but to the dry surface; they may be applied to any kind of surface. When tempera paintings have been coated with an oil varnish for purposes of preservation, it is difficult to distinguish them from oils. They are usually clear and brilliant in color, precise in form and outline; the rapid drying of the color preventing any blending of color or outline.

Tempera is probably the most venerable kind of painting, having been used in ancient Egypt, Babylon, and Nineveh, and by the Greeks for interior decoration. It was the favorite medium throughout the Middle Ages, even for wall decoration. During the fourteenth and fifteenth centuries the increased technical skill led to the more frequent use of fresco, which had to be executed with great rapidity (see *Fresco*); but tempera was used for the finishing touches. It continued to prevail for panel paintings until the perfection of the new oil medium by the Van Eycks (q.v.) displaced it in the north. In Italy its use lingered until about 1600, nearly all of the greatest paintings of the early Renaissance which are not frescoes being executed in this medium. In recent years tempera has been revived with some success, particularly since the publication and translation of Cennino Cennini's treatise, which embodied the methods used by the early Italians; in Germany by Baron von Pereira at Stuttgart, and in France by Vibert and others. In England the Tempera Society has held exhibitions since 1905. Consult: Pereira, *Leitfaden für die Temperamalerei* (Stuttgart, 1893); *The Book of the Art of Cennino Cennini* (Eng. trans., London, 1899); P. G. Hamerton, *Graphic Arts* (new ed., Boston, 1902); Friedlein, *Tempera und Temperatechnik* (Munich, 1906).

TEMPERAMENT (Lat. *temperamentum*, due proportion, from *temperare*, to proportion, modify, from *tempus*, time, season). Emotional constitution, i.e., disposition towards a given type of emotional reaction. An individual's temperament is said, e.g., to be impulsive if he responds, as a rule, quickly and with feeling to situations; the temperament of the opposite type is said to be cold and sluggish. The usual classification of temperaments is that formulated by Galen: choleric (energetic, objective), sanguine (warm, impressionable, changeable), melancholic (sentimental and subjective), and phlegmatic (quiet, slow, and persistent). The manner in which these differ both in strength and in the rapidity of alteration in the affective reaction may be expressed as follows:

	Strong	Weak
Quick.....	Choleric	Sanguine
Slow.....	Melancholic	Phlegmatic

The word is used more widely to cover any general mental characteristic or aptitude: e.g., nervous or musical or artistic temperament.

See *DISPOSITION*; *MENTAL CONSTITUTION*; *TENDENCY*.

TEMPERAMENT. In music, a system of compromise in keyed instruments for the avoidance of the necessity presupposed by the strict relation of musical intervals of having a separate row of keys corresponding to each tonic. Taking C as keynote, the ratios of the notes of the diatonic scale, as derived from the number of vibrations in a given time of a string sounding that note, are:

C	D	E	F	G	A	B	C
24	27	30	32	36	40	45	48

The intervals between these notes are by no means equal, and may be thus expressed in numbers by logarithms:

C	D	E	F	G	A	B	C
51	46	28	51	46	51	28	

We have here three species of intervals, of which those represented by 51 are called major tones; those by 46, minor tones; and the smaller intervals represented by 28, semitones. These intervals will evidently only serve with C as keynote. If, e.g., we start from D instead of C, we find E a tolerable, though not quite correct, second to D; but the third and seventh of the scale are entirely wrong. Were the major and minor tones equal, and each semitone exactly half a tone, the insertion of a note in the middle of each tone dividing the seven intervals would make it immaterial where the scale began, any one of the 12 notes becoming alike available as a keynote; and though such equality is contrary to the immutable principles of harmony, an arrangement based on it is found practically to give but little offense to the ear. In what is called the equal temperament, the 12 intervals are all of the same length, and no advantage is given to one key over the rest. This is, in theory at least, the temperament adopted in the pianoforte. By means of this equal temperament it is possible to start from any tone of the scale and, going always by the interval of a fifth, arrive at the same tone six octaves above or below the starting tone. Acoustically, c^{\sharp} is 74-73 higher than the sixth octave of C. Instead, therefore, of using the acoustic fifth the tempered fifth is used, which makes b^{\sharp} identical with c^{\sharp} . Hence the possibility of free modulation through all keys, which in recent times has led to the recognition of tonality (q.v.). As soon as the principle of equal temperament was understood the modern system of major and minor modes displaced the old church modes. Two of the most active champions of equal temperament were Rameau and J. S. Bach. The former was chiefly the theorist, the latter the practical composer. Bach's immortal *Wohltemperiertes Klavier* was written with the special purpose of introducing the new system of equal temperament. See *COMMA*.

TEMPERANCE (Lat. *temperantia*, moderation, sobriety, self-control, from *temperare*, to

proportion, modify). Primarily, a moderate use and enjoyment of all good things. In modern days the word is often used to designate great moderation in the use of alcoholic beverages, or even total abstinence from them.

Among uncivilized races, ancient and modern, intoxication has been associated with religious ideas and has been encouraged as an incident of religious festivity. As a common vice of appetite it has always been condemned, and in almost all communities in one way or another punished. The earliest attempt at temperance reform is claimed by the Chinese, who affirm that in the eleventh century B.C. one of their emperors ordered all the vines in the Kingdom to be uprooted. Early reforms are attributed also to the priests of India and of Persia. The Carthaginians forbade wine in their camps, and to magistrates holding public office. Among the Hebrews there were sects and orders which abstained from intoxicants. The Buddhists taught total abstinence. The Christian Church made attempts to bring about a more moderate use of the wine cup. St. Gildas dealt out severe punishment to any churchman guilty of drunkenness. Dunstan is said to have labored in the cause of temperance in England to the end that King Edgar at his instance restricted the number of taverns and the quantity of intoxicants that might be sold. By a law of 1285 taverns in London were required to close at curfew. From 1603 legislation against alehouses and drunkenness increased. In 1736 Parliament attempted to restrict the use of gin by means of a prohibitory tax, which, however, only brought about an illicit trade.

United States. In April, 1808, a society was formed at Moreau, Saratoga Co., New York, with 43 members, which provided in its constitution that "no member should drink rum, gin, whisky, wine, or distilled spirits, . . . except by advice of a physician or in case of actual disease (also excepting at public dinners), under penalty of 25 cents; . . . provided that this article shall not infringe on any religious rites." This society existed for 14 years, but accomplished little. The American Temperance Society was founded in Boston, February, 1826, and the New York State Temperance Society in 1829. By 1830 the latter society numbered 100,000 members. In 1833 prominent members of Congress organized the Congressional Temperance Society. Before the Civil War many secret societies were established for the promotion of temperance. They required a pledge of total abstinence, advocated prohibition, and tried to educate public sentiment in favor of reform. They also provided the usual beneficiary features and opportunities for self-culture. The Sons of Temperance, founded in 1842, grew rapidly in membership and influence. (See **TEMPERANCE, SONS OF**.) The Independent Order of Good Templars was started in New York in 1851. It spread over the world. (See **GOOD TEMPLARS, INTERNATIONAL ORDER OF**.) The Templars of Honor and Temperance (1845) were strong in the South. Later benefit but non-secret societies are the Royal Templars of Temperance (Buffalo, 1869), and the Templars of Temperance, an order strong in England and Scandinavian countries. After the Civil War consolidation of societies began. In 1865 the National Temperance Society and Publication House was organized at Saratoga, as a non-partisan and nonsectarian society, advocating

total abstinence. This society published and distributed pamphlets, textbooks, and papers, held public meetings, and called national and international conferences. The Women's Crusade led to the organization in 1874 of the Woman's Christian Temperance Union (q.v.). In 1868 a prohibition party was organized in Illinois and a temperance political party in Michigan. The call for a convention came from the Grand Lodge of Good Templars. The National Prohibition Party was organized in Chicago in September, 1869. (See **PROHIBITION**.) Law and Order Leagues were established to see that existing legislation is properly enforced (Chicago, 1872; New York, 1877; Philadelphia, 1880; Massachusetts, 1882). In 1883 the general society—the Citizens' Law and Order League of the United States—was formed.

Temperance sentiment developed rapidly. A number of temperance organizations were formed, important ones being the Lincoln Legion (1903), a total abstinence league, and the Loyal Temperance Legion, a temperance organization for juveniles. The Intercollegiate Prohibition Association (1901) has an enrolled membership of 8800. In 1914 the Secretary of the Navy issued an order which prohibited the introduction for drinking purposes of alcoholic liquors on board any naval vessel or within any navy yard or station. Most of the railroads have stopped serving liquor on their trains. Railroads and industrial concerns are refusing to hire men who drink. Such railroads as the Pennsylvania have rigid rules against the use of intoxicants at any time. Industries such as the American Car and Foundry Company, American Sheet and Tin Plate Company, and the Lukens Iron and Steel Company have prohibited the use of liquor among employees. The Antisaloon League of America celebrated its twentieth anniversary in 1913. Law and Order Leagues have been formed in many States to assist in enforcing prohibition legislation. The Catholic Total Abstinence Union of America has about 100,000 members.

Great Britain. In August, 1829, a temperance society was started at New Ross, County of Wexford, Ireland, whose members pledged themselves to abstain from liquors, except as medicine. At the same time a similar movement began in the north of Ireland. Within 12 months there were 60 societies, with 3500 members. The Glasgow and West of Scotland Temperance Society was founded in November. Up to this time moderate use of liquor was permitted, but John Dairé and others of the Society of Dunfermline pledged themselves to total abstinence and began to form total abstinence societies. The first societies in England were at Bradford, Warrington, and Manchester in 1830. The British and Foreign Temperance Society, founded in London (June, 1831), through the influence of William Collins of Glasgow, was for some years the leading temperance society in England. It was the first to start a crusade against beer. The movement for total abstinence had its beginning at Preston in Lancashire. After the formation of the Youth's Temperance Society at Preston in 1834, and its extension to other forms, a conference was held at Manchester, resulting in the organization of the British Association for the Promotion of Temperance, on the Principle of Total Abstinence from all Intoxicating Liquors. Thereupon the total abstinence element struggled for recognition in the British

and Foreign Temperance Society. In August, 1836, the teetotal society was merged into the New British and Foreign Society for the Suppression of Intemperance. The later periods of temperance work in Great Britain may be designated by: (1) the Father Mathew crusade in 1838, during which in two years 1,800,000 people took pledges in Ireland; (2) the beginning of work among children through the formation of Bands of Hope, in 1847; (3) the John B. Gough (q.v.) mission in 1858; (4) the introduction of Good Templarism, in 1868; and (5) the organization of the Blue Ribbon Army on Feb. 10, 1878, now the Blue Ribbon Gospel Temperance Movement with branch organizations, the Help Myself Societies for men and the Help One Another Societies for women. The United Kingdom Alliance (1853) urges prohibition upon Parliament.

Great Britain has a large number of important temperance societies. A few of the more important are: British Temperance Legion, United Kingdom Alliance, Army Temperance Association, Navy Temperance Association, Temperance Legislation League, Sons of Temperance, British Medical Temperance Association, British National Woman's Temperance Union, and World's Woman's Christian Temperance Union. A complete list of the important temperance associations is given in Hazell's *Annual*, 1915.

The temperance movement in America and Great Britain has been characterized by the emotionalism of religious revivals. Prayer and conversion were offered as aids to reform. Many religious organizations as such have interested themselves in temperance work. The Methodist church from the days of the Wesleys has advocated total abstinence. The Friends were opposed to drinking, and among the Dunkards abstinence was a test of fellowship. Since the beginning of the nineteenth century, Baptists, Congregationalists, and Presbyterians have been opposed to drinking. Among the general church organizations are: The Congregational Total Abstinence Association (1874); The Baptist Total Abstinence Association (1874); the Total Abstinence Society of the Presbyterian Church of England (1892); a number among various Methodist sects; Church of England Temperance Society (1862, reorganized 1873), formed to promote temperance, to study the causes of the abuse of alcohol, and to do rescue work. The Roman Catholic church advises moderation, but where this is impossible, total abstinence. The International Antialcohol Congress has been held biennially for 20 years. In 1913 at Paris was held the first meeting of the International Committee for the Study of the Liquor Question.

Medical men have formed societies, such as the British Medical Temperance Association, (1872) advocating total abstinence and making investigations, and the American Medical Temperance Association (1891). Some labor unions, especially the Knights of Labor, have discouraged the use of intoxicants. Farmers' associations, such as the National Farmers' Alliance and the National Grange, have put themselves on record as opposed to the liquor traffic. Among the many children's societies that have been organized are: the Cold-Water Army (1828); juvenile branches or cadets of secret societies; Bands of Hope; and the Loyal Temperance Legions of the W. C. T. U. In opposition to temperance reformers, liquor manufacturers and dealers have organized to prevent hostile legis-

lation. In 1862 the United States Brewers' Association was formed to oppose the internal revenue taxes and prohibition. In Illinois the brewers organized, purchased saloon sites in Chicago, and established cheap saloons conducted by agents. The Liquor Dealers' and Manufacturers' State Protection Association of Illinois is another association of liquor men.

In August, 1846, a World's Temperance Congress was held in London, at which 302 delegates were present. Since then there have been other international conventions, notably the World's Temperance Congress of 1893 at Chicago. At this meeting the economic aspects of the problem, especially the cost to the workingman, were emphasized. There was a general feeling in favor of total abstinence among English and Americans, while the Europeans advocated moderation and the drinking of wine. In Australia the movement has progressed along the same line as in England and America.

Canada. Various societies, including the Independent Order of Good Templars, Sons of Temperance, Dominion Prohibition Alliance and its provincial branches, Women's Christian Temperance Union, Royal Templars of Temperance, and other similar organizations did much to mold Canadian public opinion in favor of temperance and prohibition. In 1864, three years before confederation, the Dunkin Act provided for local option in the townships and smaller municipalities of Ontario and Quebec. In 1878 the Canada Temperance Act, commonly known as the Scott Act, enlarged the scope of local option by providing for prohibition in entire counties, many of which adopted it. Ten years later a reaction against this law caused its repeal in numerous cases, and this was followed by attempts at Dominion and provincial prohibitory legislation. Public opinion was sounded by plebiscites, but the majorities were not large enough to warrant legislation. A majority of the provinces then enacted local option laws, but about 1912 a renewed demand for provincial prohibitory laws made itself felt. In 1914-15 abolition of the bar was made a part of the Ontario Provincial Liberal platform, and 77.3 per cent of the voters favored it in 1916. In the same year nine-tenths of Nova Scotia was under prohibition by local option. In Quebec Province the same held true of 480 municipalities, but compensation is provided for liquor license holders in Quebec and Montreal whose licenses were annulled by statute. The Province of Saskatchewan in 1915 abolished the bar, placed all liquor stores under local option laws, and forbade them to be kept in connection with hotels. Manitoba passed a prohibitory law in 1916. Prohibition was in force in 1916 in Prince Edward Island. Prohibitory restrictions on account of the Great War were applied in the various provinces for the protection of the troops and to aid recruiting.

Scandinavian Countries. Drunkenness has been a serious vice in Sweden and Norway. Various temperance societies have been organized, and the efforts to solve the question by means of the Bergen system of monopoly in Norway and the Gothenburg system (q.v.) in Sweden have received much comment. Under a system of local option half the towns of Norway have prohibited the sale of alcoholic liquors. Iceland adopted prohibition in 1908.

Germany. The German Temperance Society was organized in 1837, but the national custom

of beer drinking lessens the importance of the liquor problem in that country. As a war measure, in order to preserve barley for bread, the quantity of beer which could be brewed throughout the Empire was limited to 40 per cent of the average output; local authorities were given the power to limit or prohibit the sale of spirits; in certain areas spirits could not be sold to soldiers in uniform.

Austria. Only recently has a temperance movement been organized. The Society for Checking Inebriety was started in 1884. As a war measure the malting of corn was prohibited, the week-day hours for the sale of drink limited to from 9 A.M. to 5 P.M., and Sunday closing imposed where nothing but liquor was sold.

Belgium has several temperance societies, among them the Association against the Abuse of Alcohol (1878).

Switzerland has a total abstinence movement, superseding societies advocating moderation. The Blue Cross Federation was founded in 1877. In 1908 the importation of absinthe was prohibited.

Latin Countries. Spain, up to 1860, was a sober country. Since then a slight increase in drunkenness has been due to the adulteration of wines, which has caused the people to use spirits. There is no active temperance movement, however. Since the destruction of the vines has led the poor of France to drink adulterated spirits, drunkenness has increased, and there is a decided temperance movement in favor of moderation rather than total abstinence. The sale of absinthe was prohibited in 1914 as a war measure.

Russia. Drunkenness has been a great vice in Russia. The peasant drink vodka is particularly intoxicating. Various temperance societies exist. In 1914 the Russian government stopped the manufacture and sale of vodka, with remarkable results in increase of savings and improvement in public order.

General Considerations. 1. *Economic Aspects.*—A large amount of capital is invested in the liquor business—vast manufacturing plants (breweries and distilleries), and the property, fittings, and money paid for bonds and licenses necessary for the retail trade. In the United States from the 1909 census figures the number of distilleries was 613; total number of persons engaged in the distilling industry, 8328; average number of wage earners, 6430; capital invested, \$72,450,336. The number of breweries was 1414; the total number of persons in the industry was 66,725; the average number of wage earners was 54,579; capital invested, \$671,158,110. The number of vinous liquor establishments was 290; total number of persons in the industry was 2726; average number of wage earners, 1911; capital invested, \$27,908,487. The statistical abstract for 1913 shows the consumption of wines and liquors in the United States for the preceding year to be 2,233,420,461 gallons. The per capita consumption was 22.68 gallons. The internal revenue collections for the year ending June 30, 1913, were: from spirits, \$163,879,324.54; from fermented liquors, \$66,266,989.60. New York City's receipts from liquor revenue for the year ending Sept. 30, 1915, were \$11,743,240.87. The annual cost of liquor consumed by the people of New York City is more than \$150,000,000. An important economic consideration for the community is the cost of maintaining criminals and paupers made so by the abuse of intoxicants.

2. *Relation to Poverty.*—Drunkenness makes greater ravages among artisans than among paupers. Warner's tables show that it was the direct cause of distress only in 15.28 per cent of the cases investigated. Drinking to excess is rather a symptom than a source of degeneration, and develops in a people of natural strength exhausted by vice, overwork, and conditions of life that undermine health.

3. *Legislative Aspects.*—Various attempts have been made to control the liquor traffic by legislation, while certain regulations have always been considered necessary. The national government, since 1789, has placed internal revenue taxes and some customs duties upon liquors. Congress also has passed laws regulating the sale of liquor to Indians and soldiers and the sale in the District of Columbia, and requiring the scientific study of temperance in the schools of the District of Columbia, military, Indian, and territorial schools. In the States the methods used to control the liquor traffic are: (1) licenses; (2) local option; (3) prohibition; (4) dispensary system. It has been customary from the earliest times to license the sale of liquor. The modern issue has been that of high license (\$500 or more), which its advocates claim lessens the number of saloons and improves their character. High licenses prevail in large cities. Local option has the advantage of the support of public opinion. The earliest laws were those of Connecticut (1839) and New York (1845). In 1912 the ruling went into effect prohibiting the importation of absinthe into the United States. In 1913 the Isthmian Canal Commission refused to issue licenses to the 35 saloons that had existed in the Canal Zone. The Webb-Kenyon Law prohibits the shipment of liquor into territory in which its sale is forbidden by State or local laws. A prohibition amendment was submitted to Congress in 1913 but failed to receive the necessary two-thirds vote to have it submitted to the States for ratification. There are now 19 prohibition States and 19 having local option. Among the prohibition States is South Carolina which had been distinguished as the only State having the State Dispensary System. The States having prohibition are Alabama, Arizona, Arkansas, Colorado, Georgia, Idaho, Iowa, Kansas, Maine, Mississippi, North Carolina, North Dakota, Oklahoma, Oregon, South Carolina, Tennessee, Virginia, Washington, and West Virginia. In the States having county or municipal local option much of the territory is without the saloon.

Remedies. The arguments advanced against the use of alcoholic drinks have been: (1) Scriptural, based on a supposed distinction in the Bible between fermented and unfermented wine, as shown by the use of the Hebrew words *yayin* and *tirosh*; (2) physiological, which claims alcohol to be a poison and which shows that temperance conduces to health; (3) social, viewing alcohol as a cause of crime, vice, and poverty; and (4) economic, in that the manufacture and consumption of alcohol are nonproductive and a great waste of material. The remedies offered by the early temperance movement were reformatory and preventive. Moral suasion was used, and drinkers were urged to sign the pledge and to strengthen themselves by the aid of prayer and religion. Total abstinence was demanded of the strong to help the weak. Prohibition was urged in order to remove temptation. Homes and asylums were

established, as the Washingtonian House in Chicago and the Franklin Home, Philadelphia. The prevention work was largely educational through the distribution of literature, lectures, the formation of societies, and the preparation of textbooks for use in the public schools. Business considerations now exert an important influence. In positions of responsibility or where accidents are likely (such as engineers, foremen, watchmen) drinking is prohibited. The habits of applicants for employment are carefully scrutinized, especially in the business of transportation. Even where moderation is overlooked, excess is never tolerated. Saloon property pays a higher insurance rate. Some life-insurance companies refuse to insure men engaged in the liquor business.

Important contributions to the study of the liquor problem have been made by the Committee of Fifty formed in 1893 and comprising representative men in the fields of education, religion, and sociology. The committee had its origin in a group of men who, beginning in 1889, had associated themselves for the purpose of pursuing the study of practical problems in sociology. Meetings are held twice a year in New York. Four subcommittees deal with the different aspects of the liquor problem, physiological, legislative, economic, and ethical.

TEMPERANCE, SONS OF. An order founded in New York in 1842 with the object of making the great temperance movement of that period permanent. It has life insurance, sick and funeral benefit features. There are male and female members and there is a cadet branch for boys of 16 years, who are known as the Cadets of Temperance, and who subscribe to a pledge which binds them to avoid all connection with the use, sale, or manufacture of spirituous liquors. There are five grand divisions of the

order, one in England, where it was introduced in 1846, two in Australia, one in New Zealand, and one in North America. About one-half of the members are in the United States and it is estimated that 3,000,000 members have been on the rolls since the organization of the order. The membership in North America in 1916 was about 25,000, of which 12,000 were in the United States. The ritual is very impressive. The order is now established in Great Britain, Ireland, the Bahamas, Liberia, New Zealand, Australia, Scotland, and Wales.

TEMPERANCE LEAGUE, LOYAL. See LOYAL TEMPERANCE LEAGUE.

TEMPERATURE. See HEAT.

TEMPERATURE, CRITICAL. See CRITICAL POINT.

TEMPERATURE, TERRESTRIAL. The distribution of heat in the atmosphere depends to some extent on its direct absorption of solar radiations, and especially the absorption at the upper surface of the clouds, but is principally governed by the angular altitude of the sun and the contact of the air with the ground and the ocean. The marked irregularities of temperature give rise to the great currents of air as well as to the local winds, and the latter carry the heat rapidly from one part of the globe to the other, so that ultimately the atmospheric temperature is almost equally controlled by the winds on the one hand and the oceans, continents, rain, snow, and cloud on the other. The typical continental climates experience great diurnal and annual ranges of temperature, and the typical oceanic climates show a small range.

The distribution of temperature on any level surface at any depth below or height above sea level is shown by means of isotherms, which are drawn through all places that have the same temperature at any moment, or the same monthly or annual mean temperature. Charts showing these isotherms have been published by various meteorological services for the air and the land, and by various hydrographic offices for the oceans. The highest mean annual temperatures occur within the tropics and especially over the land areas of northern Africa and southern Asia, with corresponding small regions in Central America and the northern portion of South America. Abnormally high maximum temperatures occur in limited regions outside the tropics but are the result of peculiar topographic conditions. Thus Death Valley, Cal., experienced maximum temperatures of 120° to 134° in the years 1911 to 1915, the reading of 134° F. in July, 1914, being the highest known natural air temperature in the United States and probably in the world. (*Monthly Weather Review*, June, 1915, p. 278-280.) The lowest mean annual temperatures are found in northern Siberia and the northern portions of British America, which represent the southern extension of a large Arctic area of low temperature. See CLIMATE.

TEMPERATURE OF THE BODY. The temperature in the healthy human adult averages from 98.4° to 98.6° F., but 97.5° and 99° F. are within normal limits. In the newborn child the temperature is slightly above the average, as it is in old age. Race has but a slight influence, a difference of 0.29° F. being observed between the nations of southern Europe and those of the northern part. The temperature rises slightly after a meal and during exercise. During the day the body heat varies about half

a degree, being highest between 5 and 8 P.M., and lowest between 2 and 6 A.M. In childhood the temperature is easily and rapidly influenced, slight ailments causing marked febrile reaction. The temperature is registered by means of the clinical thermometer, which is self-registering, placed in the mouth, axilla, fold of the groin, the rectum, or the vagina. The surface of the body is slightly cooler than the interior. A temperature below 93° or above 108° F. is almost always fatal. The usual range in fevers is between 99.5° and 105° or 106° F. As a rule there is a constant relation between the amount of fever and the rapidity of the pulse (q.v.) in many people. A pulse of 80 indicates a temperature of 100° F.; a pulse of 90, a temperature of 101° F., etc. A rise of temperature between 99° and 102° F. is termed slight or moderate pyrexia; from 101° to 105° F. severe pyrexia; and above this point hyperpyrexia. Many chronic and a few acute diseases are characterized by a subnormal temperature. This is observed in hemorrhage, starvation, and wasting from chronic diseases. In the melancholia of certain mental troubles there may be great depression both of the general and surface heat. An elevation of temperature attends most acute and some chronic diseases. In the great class of the acute general infections (see NOSOLOGY) an elevation of the body heat is the most important symptom and is proportional to the severity of the disease. Very marked elevation of temperature (hyperpyrexia) is seen in tetanus, acute rheumatism, pernicious malarial fever, and after injuries to the spinal cord. In tetanus the thermometer may register as high as 112.5° F. In sunstroke or heat stroke, an equally high point has been reached. Lastly, the temperature may rise just before death, and after it, in *rigor mortis*. See ANIMAL HEAT; FEVER; ETC.

TEMPERATURE VARIETIES. Varieties, races, or subspecies are largely differentiated by variation resulting from being subjected to different influences, principally in the nature of temperature and comparative moisture. It is a matter of universal observation that widespread species present a great range of variability in size, proportion of parts, color, and other characteristics, so that it is often a matter of doubt whether a variant ought to be classed as a geographical subspecies, or as a distinct species. When it appears that the same kind of variation affects all or nearly all of the animals of a certain class in a region, coincidentally with the character of the local climate, it is probable that the change from the normal noted is due to local climatic influence. Temperature seems to act most directly in producing the common form of seasonal dimorphism, which affects most of the higher animals that dwell in the temperate zones, and are called upon to endure winter cold as well as summer heat. This causes a semiannual change in mammals and birds from a comparatively thin and short coat of hair or feathers in warm weather to a thicker and longer covering more suitable to the cold. In addition, there is a greater or less change of color, the bright dress of summer, assumed after the spring molt, falling out in the autumn and being gradually succeeded by a plainer coloring for the winter months. The difference is often very great; and in the Arctic regions amounts to a change from decided colors in summer to pure white in winter.

The comparative degree of average moisture in the air of two regions will be reflected in the colors and other features of the same species of animals inhabiting them; those of the moist region will have darker colors, and a tendency to larger size and proportionally longer external parts, as bills, legs, and tails, than the dry land species, which will be more pale in color and compact in form. Dr. J. A. Allen has shown this very conclusively in his investigations upon North American birds, and C. W. Beebe has demonstrated it in his experiments on doves and other birds in the New York Zoölogical Park. Let one of two districts differing in average moisture be severed for a considerable period from the other and the results accredited to isolation (q.v.) would follow; but the species so formed might well be called temperature species in reference to their origin. Geographical races may therefore be regarded as incipient species.

That changes from heat to cold, wetness to dryness, or the reverse, in the climates of regions of the world in the course of its history since animal life appeared upon it, have been efficient factors in species making, may well be believed. See EVOLUTION; MELANISM; ISOLATION; and consult authorities there mentioned.

TEMPERING STEEL. Steel is hardened by heating to a cherry red which is slightly above its critical point (750° C.), and suddenly cooling. The hardness varies directly with the percentage of carbon and the rate of cooling. Steel quenched in water is very hard but is also brittle. It is therefore tempered by reheating to 200°–300° C., whereby the metal is toughened with some loss in hardness. If tempering be done in air and if the surface is free from oxide, the process can be followed by the temper colors which form on the surface, viz.: straw, 200° C.; golden yellow, 245° C.; brown, 265° C.; purple, 280° C.; blue, 290° C.; dark blue, 300° C. Thus a razor would be drawn to a straw color, while an axe requires a blue.

Tempering can be done in liquids such as oil, salt baths, molten lead, etc., the temperature being controlled by a thermometer or pyrometer, immersed in the bath.

Instead of hardening in water, the metal may be quenched in liquids which abstract the heat more slowly, as, e.g., oil or molten lead, the resulting metal being less hard but not so brittle. Steels of high carbon or intricate shape are liable to crack when water quenched and are usually hardened in oil, or molten lead (oil hardening, lead hardening), commonly spoken of as oil tempering and lead tempering. The word "temper" originally meant hardness (*trempe*, quenched) and we still use it to mean carbon content, e.g., die temper, 0.75 per cent; chisel temper, 1.0 per cent; razor temper, 1.4 per cent. See ANNEALING; IRON AND STEEL, METALLURGY OF; METALLOGRAPHY.

TEMPEST, MARIE SUSAN (1866–). An English actress, born in London of parents named Etherington. She received her early education at a convent in Belgium, and later studied music in Paris and London. Her first appearance on the stage was at the Comedy Theatre, London, in 1885, as Fiametta in *Boccaccio*. For some years she acted chiefly in musical plays, notably in *Dorothy* (931 times), but with her creation of the part of Nell Gwyn in *English Nell* (1900) and Becky Sharp (1901), she was recognized as one of the leading comedienness

of the English stage, a position which she continued to hold. Some of her best-known parts were Polly Eccles in *Caste*, Peggy O'Mara in *All-of-a-Sudden Peggy*, Becky Warden in *The Truth*, and Kitty in *The Marriage of Kitty*. She visited America for the first time in 1890, playing Kitty Carroll in *The Red Hussar*, at Palmer's Theatre, New York, and thereafter was almost as well known in the United States as in England. In 1914 she appeared in New York in the title rôle of Henry Arthur Jones's comedy, *Mary Goes First*, a part in which she had already been successful in London; and in 1915 she revived *The Duke of Killiecrankie*, one of her former successes. Miss Tempest was sometimes her own manager. She was married in 1898 to Cosmo Gordon-Lennox.

TEMPEST, THE. A play by Shakespeare, first acted in 1610, and first printed in the *Folio* of 1623. The sources are principally books of travel: Eden's *History of the Travaile* (1577), Raleigh's *Discovery of Guiana* (1596), and S. Jourdan's *Discovery of the Bermudas* (1690), telling of Sir George Somers's fleet at Bermuda in 1609.

TEMPESTA. See MULIER, PIETER.

TEMPLARS, KNIGHTS. A religious and military order of the Middle Ages, the great rival of the Knights of St. John of Jerusalem. In 1119 Hugues de Payens and Geoffrey de Saint-Ademar (Saint-Omer), with six companions, formed a military band to protect pilgrims in Palestine. They adopted a monastic rule, and took the name Knights of Christ. But as quarters were assigned to them in the palace at Jerusalem, known as Solomon's Temple, they soon were called Knights of the Temple, or Knights Templars (*milites templi*). In 1128 at the Council of Troyes a rule, inspired by St. Bernard, and closely following the Cistercian, was given them.

The order grew rapidly. At the end of the thirteenth century it had about 15,000 members, and in the middle of that century it is said to have owned 9000 castles and manors. It was free from all taxes and was under the jurisdiction of the Pope alone. As the order had to make regular transfers of supplies and money from Europe to Palestine, they developed an effective banking system. Their strong and well-manned temples were the safest places for depositing treasure and documents and for a time the Templars were the bankers of Europe. There were three ranks in the order, knights, chaplains, and servants. The knights, few in number, were the real Templars. They directed the affairs of the order; they alone could wear the white mantle with its red cross. At the head of the order was the grand master. The capital of the order was at Jerusalem till 1187, and then successively at Antioch, Acre, and Cæsarea, and after the extinction of the Christian power in Syria (1291), in Cyprus. Their standard, called *Beauséant*, was half black, half white, with the motto *Non nobis Domine*. The Templars' wealth, pride, and power brought them into conflict with Church and State. With the decay of the crusading spirit their activity was feared, and in the latter half of the thirteenth century opposition grew. They had made enemies in other military orders and among the monastic orders. Their adoption of Oriental customs and the secrecy of their rites impressed popular imagination. They were charged with evil and sacrilegious practices. The direct at-

tack on them came in France. Philip IV, under the influence of Guillaume de Nogaret, saw his chance to be rid of an insubordinate order, and to increase his wealth. He got Pope Clement V to aid him. On Oct. 13, 1307, the grand master, Jacques de Molay (q.v.), and many other Templars, were arrested without warning. Their trial was in charge of the Inquisitor for France. Most of them under torture confessed to some or all of the charges against the order. Many afterward retracted, including Molay. A large number were burned at the stake, Molay being spared for a number of years. In 1311 Clement called the General Council of Vienne, chiefly for the purpose of suppressing the order. When the council persisted in demanding that the question should be tried strictly as a judicial question without any regard for policy, Clement held a secret consistory, March 22, 1312, at which the suppression was decreed. On April 3 the bull *Vox in excelso* was published declaring the reasons for the papal condemnation. On May 2 the bull *Ad providam* was issued decreeing the final abolition of the order. Its property went to the Hospitalers; but the seizures of Philip were confirmed to him. Jacques de Molay was burned in 1314.

Consult: Henri de Curzon, *La règle du temple* (Paris, 1886); Julius Gmelin, *Schuld oder Unschuld des Tempelordens* (Stuttgart, 1893); H. C. Lea, *History of the Inquisition*, vol. iii (new ed., New York, 1906); Heinrich Finke, *Papsttum und Untergang des Tempelordens*, vol. i (Münster, 1907); Marquis d'Albon, *Cartulaire générale de l'ordre de Temple*, vol. i (Paris, 1913).

TEMPLE. A building consecrated to religious worship, especially among pagan peoples. The term is also applied to the chief sanctuary of the Jews (see TEMPLE AT JERUSALEM), to Christian churches belonging to the Knights Templars, and in France to Protestant places of worship. It is also applied to the meeting places of certain Masonic bodies, and to buildings having the form or character of an antique temple. A temple was usually dedicated to some deity, whose image it contained; the interior was accessible to priests, but not to the general body of worshippers. Among most ancient peoples the temple was the principal architectural feature, as in Greece, where the history of temple construction is practically the history of architecture. The subject is therefore best treated under the general title ARCHITECTURE, and in the subdivision *Architecture* in such articles as ASSYRIAN, BABYLONIAN, CHINESE, EGYPTIAN, GREEK, INDIAN, JAPANESE, and ROMAN ART; also under ARCHITECTURE, ANCIENT AMERICAN; and BAALBEK. In general, it may be observed that the ancient temples (excepting those of Chaldaea-Assyria) had these elements in common: a sanctuary containing the effigy or some other sacred symbol of the deity or deities worshiped; colonnades to shelter worshippers outside the sanctuary; one or more courts or inclosures with important gateways; and sometimes such adjuncts as a lake, grove, fountain, or well sacred to the deity. The Pantheon (q.v.) at Rome was dedicated "to all the gods." Temples of fame are a modern product; such are the Walhalla (q.v.) near Ratisbon, the Ruhmeshalle at Munich, and the Temple of Fame of the University of New York, which is really an open colonnade. See HALL OF FAME FOR GREAT AMERICANS.

TEMPLE. A city in Bell Co., Tex., 35 miles south by west of Waco; on the Gulf, Colorado, and Santa Fe and the Missouri, Kansas, and Texas railroads (Map: Texas, D 4). It has a Carnegie library, Temple Sanitarium, King's Daughters' Hospital, and the Gulf, Colorado, and Santa Fe Railroad Hospital. Cottonseed-oil mills, cotton gins and compresses, foundries and machine shops, bottling works, a large cold-storage plant, flouring mill, and a candy and chewing-gum factory are among the leading industrial establishments. The Gulf, Colorado, and Santa Fe Railroad maintains shops here. Pop., 1900, 7065; 1910, 10,993; 1915 (U. S. est.), 13,104; 1920, 11,033.

TEMPLE, BARON MOUNT-. See **MOUNT-TEMPLE, BARON**.

TEMPLE, FREDERICK (1821-1902). Archbishop of Canterbury, born at Leukas, in the Ionian Islands, and educated at Balliol College, Oxford. He was principal of Kneller Hall, and then inspector of church training colleges, until he was elected head master of Rugby, where his administration was very successful. In 1860 his name was prominent as one of the authors of *Essays and Reviews*, a book supposed to have a rationalizing tendency, though Temple's own essay on "Education of the World" contained little that would be considered dangerous nowadays. The suspicion of heterodoxy clung about him and found expression, when Gladstone in 1860 nominated him as Bishop of Exeter, in a formal protest against his confirmation. This distrust died away, and he acquired a reputation for absolute justice and impartiality, while in many respects his later career associated him rather with the High Church party than with the Broad. In 1885 he was transferred to the see of London, and in 1890 became Archbishop of Canterbury, and a year afterward stood out as a champion of the Church of England in a learned and dignified reply to the papal decision declaring the invalidity of Anglican ordination. He officiated at the coronation of Edward VII. His most important published work is *The Relation between Science and Religion* (1884). Consult: C. H. Dant, *Archbishop Temple* (London, 1903); F. J. Snell, *Early Associations of Archbishop Temple* (New York, 1905); *Memoirs of Archbishop Temple by Seven Friends*, edited by E. G. Sandford (2 vols., ib., 1906); H. C. Potter, *Reminiscences of Bishops and Archbishops* (ib., 1906).

TEMPLE, HENRY JOHN, third Viscount PALMERSTON. See **PALMERSTON**.

TEMPLE, SIR RICHARD (1826-1902). An English politician and author, born at Kempsey, near Worcester, and educated at Rugby. Having entered the Indian service in 1847, he rose quickly, becoming Finance Minister of India (1868), Lieutenant Governor of Bengal (1874), and Governor of Bombay (1877-80). On his return to England in 1880 he became financial member of the London School Board (1886-94) and president of the Social Science Congress. From 1885 to 1895 he sat in Parliament as a Conservative. For his services he was made Baronet in 1876. His publications include: *India in 1880* (1881); *Men and Events of my Time in India* (1882); *Oriental Experience* (1883); *Cosmopolitan Essays* (1886); *Palestine Illustrated* (1888); *Memoir of John Lawrence* (1889); *Story of my Life* (1896); *A Bird's-Eye View of Picturesque India* (1898); and *Letters and Character Sketches from the*

House of Commons, 1886-87 (published posthumously in 1912).

TEMPLE, RICHARD TEMPLE GRENVILLE, EARL (1711-79). An English statesman. He was the eldest son of Richard Grenville of Wotton Hall, Buckinghamshire, and was educated at Eton and privately. In 1734 he was returned to Parliament for Buckingham. On the death of Viscount Cobham in 1749 his mother was created Countess Temple and upon her death in 1752 Grenville succeeded to the Temple earldom. He was a political associate of William Pitt, who married Grenville's sister Hester, and he held the position of First Lord of the Admiralty, 1756-57, and Lord Privy Seal, 1757-61. He was afterward in frequent opposition to the King and was a violent promoter of factions. Consult the *Grenville Papers* (1852-53), which consist of the correspondence between Pitt and George and Richard Temple and throw much light on the political and court life of the period.

TEMPLE, THE. 1. A former stronghold of the Templars in Paris, built in 1212. When the order was suppressed in 1312 it was used as a royal treasury and subsequently as a prison. During 1792 and 1793 Louis XVI and his family were confined in it. The last remains of the building were removed in 1871 and its site is now occupied by the Marché du Temple. 2. A former lodge of the Templars in London, dating from the end of the twelfth century, and now represented by Temple Church (q.v.) and the Inns of Court, known as the Inner and Middle Temple, which stand on the site of the ancient building, the former within the precincts of the city. The Temple became crown property when the order was dissolved, was presented to the Earl of Pembroke, and then passed to the Knights of St. John, who leased it to law students.

TEMPLE, SIR WILLIAM (1628-99). An English statesman and essayist, born in London. He was reared by an uncle, Dr. Henry Hammond, rector of Penshurst, in Kent. He entered Emmanuel College, Cambridge, in 1644; but he left four years later without a degree, and set out for France. On this journey he met Dorothy Osborne (q.v.). In 1665 Temple was sent to Westphalia on a secret mission to the Prince Bishop of Münster. On his return (1666) he was created Baronet, and appointed Resident at the court of Brussels. His most important diplomatic success was the famous treaty of 1668, known as the Triple Alliance, by which England, Holland, and Sweden bound themselves to unite in curbing the ambition of France. Temple was long Ambassador at The Hague and helped to bring about the marriage of the Prince of Orange with the Princess Mary (1677). In 1679 Charles II urged him to become his Secretary of State. Though Temple refused this post, he attempted to reform the government by establishing a privy council of 30 members, by whom the King promised to be guided in all public affairs, but this council proved an utter failure. Temple soon abandoned politics and retired, first to Sheen, and then to Moor Park in Surrey, where for the last 10 years of his life he devoted himself to landscape gardening and to literature. During this period he received into his household as amanuensis, and afterward as secretary, Jonathan Swift (q.v.), who ultimately became his literary executor.

As a writer Temple is now known chiefly by his historical *Memoirs* (unauthorized ed., 1691; 1709) and his *Miscellanea* (1680; 1692). In

the series of 1692 first appeared the famous essay on "Ancient and Modern Learning," which deals with the comparative merits of ancient and modern literature. The outcome of the spirited controversy in England was Swift's *Battle of the Books* (1704). (See *BATTLE OF THE BOOKS*.) Temple has been considered one of the reformers of English style. According to Dr. Johnson he was the first writer to give cadence to English prose. During the eighteenth century Temple's essays were regarded as models; his English was particularly pleasing to Charles Lamb, who comments upon it in his "Essay on the Genteel Style." Consult: his *Life and Works* (4 vols., London, 1814), including the *Letters*; T. P. Courtenay, *Memoirs . . . of Sir William Temple* (2 vols., ib., 1836); Macaulay's article on this biography in the *Edinburgh Review* for October, 1838 (reprinted in *Essays*); M. L. R. Beaven, *Sir William Temple*, Gladstone essay, 1908 (Oxford, 1908); E. S. Lyttel, *Sir William Temple*, Stanhope essay, 1908 (ib., 1908); *Letters from Dorothy Osborne to Sir William Temple*, edited by E. A. Parry, in "The Wayfarer's Library" (New York, 1915).

TEMPLE AT JERUSALEM. The sanctuary erected by Solomon (c.933-953 B.C.) on the eastern hill, between the Tyropeon and Kidron valleys, north of the original city of David on the Ophel hill, and opposite the Mount of Olives. According to 2 Chron. iii. 1 it was built on the threshing floor which David had purchased from Ornan (elsewhere Araunah and Ornajah, perhaps originally Adonijah), the Jebusite. Here the angel ceased smiting Israel, indicating that it was a sacred place. Probably this sanctity already adhered to it in the Amarna period (c.1400 B.C.). The construction of Solomon's temple was begun c.950 B.C. and seven years later it was dedicated. It was made possible by the friendly relations between Solomon and Hiram of Tyre, who furnished skilled workmen as well as cedars and firs from the Lebanon. In the account (1 Kings vi, somewhat expanded in 2 Chron. iii-iv) of the building certain features of the design are clearly set forth, others are wholly passed over, so that efforts to restore it from these descriptions have produced an extraordinary variety of results. The references to earlier sanctuaries at Shechem, Ophrah, Dan, and Shiloh are too meagre to be of any assistance, and the description of the tabernacle in Ex. xxv. ff. is regarded by most modern scholars as a projection into the past of the Solomonic temple itself, and an idealization of the humbler tent which actually had sheltered the palladium of Israel. The temple proper of Solomon measured 60 cubits in length, the outer sanctuary or holy place being 20 by 40 cubits in size and the holy of holies 20 by 20 cubits; both were 20 cubits high. Within the latter was the Ark of the Covenant under two cherubim (see *CHERUB*) with outspread wings; in the holy place were the altar of incense, the shewbread table, the seven-branched candlestick, and 10 smaller tables and candlesticks. Both chambers were wainscoted with cedar and wholly covered with gilding; they were separated by a veil or fixed curtain fitted with an olive-wood doorway and doors. It was this veil that is said to have been "rent in twain" at the crucifixion (Matt. xxviii. 51; Mark xv. 38; Luke xxiii. 44). The golden candlestick carried by Titus to Rome in 70 A.D. is figured in a relief on the Arch of Titus.

In front of the temple porch were two columns of bronze, Jachin and Boaz, 23 cubits high; and against its side and end walls were three stories of small chambers for the priests. The court immediately surrounding the temple was reserved for the priests, and contained the brazen altar of burnt offering and the great bronze sea, or tank, borne on 12 bronze oxen; these, with the cherubim in the holy of holies, being the only examples of free sculpture in Jewish art. A second court was the place of general assembly for all Jewish worshipers; it preceded or surrounded the first; but whether built by Solomon or encircled at a later date is not certain. Solomon's palace and the House of the Cedars of Lebanon adjoined the temple court. Dependencies and outbuildings were added at various times to the main group. Of the architectural style of the temple little is known; but its builders were chiefly Phœnicians, and the combination of an Egyptian type of plan with such Assyrian decorative details as palms, cherubim, and knobs and flowers is quite in harmony with the mixed style of Phœnician work in general. Hittite motives have also been suggested.

Solomon's temple was destroyed by Nebuchadnezzar in 586 B.C. Encouraged by the prophets Haggai and Zechariah, Zerubbabel, the Persian governor, himself a descendant of the old Davidic family, rebuilt the temple, which was finished in 516 B.C., with the permission of Darius Hystaspis. The temple proper was a reproduction of the original edifice, but far inferior to it in splendor of ornament and gilding. This second temple was desecrated by Antiochus IV Epiphanes and dedicated to Zeus Olympius in 168 B.C., but rededicated again to Yahwe in 165 B.C. Both the first and second edifices, were, however, surpassed in architectural splendor by the third temple which Herod began to erect in 20 B.C. and which was completed in 64 A.D. The area of the temple terrace was greatly enlarged by new substructures built with masonry of colossal magnitude, a section of which forms the present place of wailing of the Jews. Marble was profusely used for colonnades, gates, and walls, and the magnificence of Roman carved decoration and architectural detail was blended with the Oriental arrangement of the plan, which reproduced essentially the disposition of the two preceding structures, but with an additional exterior court of the Gentiles. A three-aisled portico of vast dimensions occupied the south side of the inclosure; Solomon's porch was re-erected in the form of a colonnade along the east front, in which was perhaps the Gate Beautiful (Acts iii. 2). This temple, from which Jesus expelled the money changers and merchants, was destroyed during the pillage of the city by Titus, 70 A.D., but contrary to his orders. After the insurrection of Simon Bar-Kokba (q.v.) had been quelled, an altar or shrine seems to have been erected in its place to Jupiter Capitolinus by Hadrian, in front of which there were two statues of the Emperor, one at least equestrian. Neither Constantine nor his mother Helena appears to have paid any attention to these structures. Julian gave a permission to the Jews to rebuild their temple, but his brief reign did not allow this project to be carried out. On the temple area, called by the Arabs *Naram el sherif*, Abd el Melek, who reigned from 685 to 705, erected a splendid mosque, the *Kubbet el Sakhrat*, or Dome of the Rock, com-

monly known as the Mosque of Omar. Except for two intervals in the period of the Crusades the place has since remained in the hands of the Moslems.

All three temples must have presented an aspect of mixed architectural styles, due to the general lack of skill in the plastic arts among the Jews, and their consequent dependence on the arts of neighboring nations. Solomon's temple was, under these circumstances, a respectable achievement; though of course not to be compared with the great temples of Egypt or Babylonia; but it was far surpassed in scale and in magnificence of external architecture by Herod's temple.

The Temple Service. The Solomonic temple was primarily intended to be a Yahwe sanctuary, as is evident from 1 Kings viii. 13. But during the period of the Davidic dynasty many other divinities were worshiped in it. (See, e.g., Ezek. viii., 2 Kings xviii., xx.) The temple of Zerubbabel appears to have been devoted solely to Yahwe. In 168 B.C. the sanctuary was dedicated to Zeus Olympius and remained a Zeus temple for three years (1 Macc. i. 54; iv. 52). The magnificent temple of Herod was until the fall of Jerusalem the great centre of the Jewish sacrificial cult, having no rival except Onias's temple (q.v.) at Leontopolis, and was devoted exclusively to the imageless worship of Yahwe.

In the regal period the King was the chief priest officiating in the temple. Whether there was a ceremony corresponding to the seizing of the hands of Bel by the Babylonian kings, cannot be determined. But the annual entrance into the holy of holies by the high priest of the Persian period may have developed out of such a custom. David set the example of appointing his own sons as priests (2 Sam. xviii. 8). There was no distinction yet between priests and Levites. Even in the Deuteronomic code, introduced about 620 B.C., the Levites are priests whose function it is to offer sacrifices. In the Persian period a high priest was at the head of the hierarchy; and only families claiming descent from Aaron were permitted to offer sacrifices. The Levites were a class by themselves and were not allowed to present the sacrifices, while musicians and doorkeepers formed a still lower class. The Levites as well as the priests were divided into 24 courses. Next to the high priest ranked the Segan, or captain of the temple police, then came the heads of the 24 courses, and a large number of other officials. While in earlier times even the common people seem to have had access to the inner court, in later times the Levites and lower ministers were forbidden to enter it. Non-Israelites were not permitted to enter any part of the temple, but representatives of the people of Israel were required to attend in turn the daily offerings in the outer court.

The Tamid, or the daily offering, presented every morning and evening, was the most important of the many sacrifices of a public character. The number of sacrifices was increased on Sabbaths and festivals. The ceremony was preceded by lustrations and solemn choice of officiating priests. It consisted of the slaughter of the victim, the sprinkling of the blood on the altar, the removing of the blood from the altar of incense in the holy place, the trimming of the lamps on the candlesticks, the carrying of the different parts of the victim to the foot of the altar, the presentation of the flour offering, the

baked meal, and the libations of wine. During the celebration of this sacrificial service, the Shema Israel (Deut. vi. 4-9; xi. 13-21; and Num. xv. 37-41), the Ten Commandments, and three blessings were pronounced by the priests. The offering of incense was accompanied with prayer. Then the Levitic choir, to the accompaniment of stringed instruments, sang the psalm of the day, divided into three sections. At the end of each, priests blew three blasts on the silver trumpets, and the people prostrated themselves. This ritual goes back at least to Hasmonæan times, and the music and singing no doubt formed a part of the daily service long before sections of the present Psalter were in use. After the public sacrifice, private sacrifices began.

TEMPLE BAR. A noted gateway between Fleet Street and the Strand, London, built in 1670 by Wren, and marking the boundary of the city. Here the sovereign, on entering the city, was obliged to ask from the Lord Mayor permission to pass. The structure was removed in 1878 to make a way for the enormous traffic and its place was supplied by the memorial bearing statues of Queen Victoria and of Edward VII, then Prince of Wales.

TEMPLE CHURCH. The church connected with the former house of the Knights Templars in London, and the only portion of the original group of buildings remaining. It consists of a Norman round church, 58 feet in diameter, dating from 1185, with a choir added in 1240. It has a richly painted ceiling and interesting tiled flooring, and contains nine monuments of Templars. See **TEMPLE, THE**.

TEMPLER UND JÜDIN, tēm'plēr unt yū'dīn (Ger., Templar and Jewess). An opera by Marschner (q.v.), first produced at Leipzig, Dec. 22, 1820.

TEMPLE SOCIETY. See **FRIENDS OF THE TEMPLE**.

TEMPLETON. A town in Worcester Co., Mass., 15 miles west by south of Fitchburg, on the Boston and Albany Railroad (Map: Massachusetts, C 2). Noteworthy features are the

Templeton Inn, State School for the Feeble Minded, Hospital Cottages for Crippled Children, and the Boynton Public Library. There are manufactories of chairs, baby carriages, playground apparatus, and post-office furniture. Pop., 1900, 3489; 1910, 3756. Templeton constituted part of the grant given the survivors of King Philip's War (see PHILIP, KING), and was once known as Narragansett Number Six.

TEMPLE UNIVERSITY. An institution founded in Philadelphia in 1888. It had its beginning in the desire to provide opportunities for study to ambitious young men who were obliged to study at night. Two years after its founding the increase in the number of students necessitated the removal to a separate building. In 1891 the power to confer degrees was conferred upon the institution, and in the autumn of the same year a day department was opened. On Dec. 12, 1907, the charter was amended, changing the name of the college from Temple College to Temple University. The Theological School was formed in 1893, the Law School in 1895, the Medical School in 1901, and in 1907 the Philadelphia Medical College was federated with the university. In 1916 there were 18 departments with 66 different courses offered to the students. The university conducts classes morning, afternoon, and evening during the academic year. The courses include those from kindergarten grades up to the highest university grades. These are given to the young people of the city for a normal fee, and with hours convenient to those who are employed either day or night. The university is nonsectarian, but is kept under a strong moral and religious influence. The total attendance in all departments of the university in 1915 was 3579. Of these 987 were in the Department of Commercial Education, 606 in the College of Liberal Arts and Sciences, 182 in the Department of Theology, 243 in the Department of Elementary Education, and 511 in the Preparatory Department. The remainder were divided among the other courses. The faculty numbered 290. The library contains about 9200 volumes. The university has no endowment. The college grounds and buildings are valued at about \$565,000. The annual income is about \$150,000. The president in 1916 was Russell H. Conwell, D.D., LL.D.

TEMPO (It., time). The degree of rapidity with which a piece of music is to be executed. The rhythmical proportions of notes, as indicated by their form, give them only a relative value, and have no reference to the absolute speed at which the entire composition is to be played. The varying rates of speed at which different compositions or their divisions are to be played are usually indicated by certain terms called *tempo marks*. These terms are not always used with exact precision, and sometimes apply more to the character than to the absolute speed of performance. The following are the most common terms, in the order of increasing speed: *Grave*, *Lento*, *Largo*, *Adagio* (slow); *Andante*, *Moderato*, *Allegretto* (moderate); *Allegro*, *Vivo* (vivace), *Presto* (fast). Gradual increase in speed is indicated by *accelerando*, *stringendo*; gradual decrease by *rallentando*, *ritardando*.

The tempo is indicated with far greater exactness by references to the beats of the metronome (q.v.). It is not, however, uncommon for composers to express the tempo by reference to some well-known musical form which has a characteristic movement, as tempo di marcia, tempo

di valse, tempo di minuetto, etc. Schumann and Wagner discarded the Italian nomenclature and indicated the tempo by means of German terms. In this they have been followed by a few other composers, but the German terms are not well enough known to be free from a certain vagueness. The Italian terms came into use at the beginning of the seventeenth century. Before that, the means of expressing the general speed at which a composition was to be played were very limited. In mensurable music (q.v.) each note had a certain average time value (integer valor); but in the course of years the unit of measure changed so frequently that great confusion ensued. In transcribing works of the sixteenth century in modern notation all notes must usually be reduced to about half their face values; in still older works the reduction should be to a quarter or an eighth of the original value. *Tempo rubato* (stolen time) characterizes a performance to which a restless movement is imparted by protracting one note beyond its proper duration, and curtailing another so that the aggregate duration of each measure remains unchanged. *Modification of tempo* is a term first used by Richard Wagner, in his article "Ueber das Dirigieren," to indicate that a composition cannot be played throughout in strict metronome time. This is especially true in dramatic music, and throws the responsibility for interpretation upon the conductor (q.v.). For detailed information regarding the above Italian terms, see the separate articles. See RUBATO, TEMPO.

TEMPORALISM. In philosophy a term coined to designate a philosophic system which lays emphasis on the fundamental character of time in the constitution of the universe, as opposed to the philosophies which slur over or deny the validity of time, such as the philosophies of Spinoza and the Hegelians. William James, H. Bergson, and A. O. Lovejoy in recent philosophy are uncompromising temporalists. Consult Lovejoy, "The Problem of Time in Recent French Philosophy," in *Philosophical Review* (Boston, 1912). See TIME.

TEMPORAL POWER (Lat. *temporalis*, relating to time) OF THE POPE. The sovereign power which the Pope possessed as ruler of the Papal States (q.v.), which, although modified in its exercise by his spiritual character, was in substance the same as that of any arbitrary sovereign. Many of the mediæval sectaries held the incompatibility of the spiritual with the temporal power in the same person, not only in relation to the Pope, but also as to the other ecclesiastics who were feudal lords. Such were the doctrines of the Vaudois, of Pierre de Bruys, and above all of Arnold of Brescia (qq.v.). Through the centuries which followed, the anti-papal controversies turned so entirely upon doctrine that there was little room for the discussion of this question, and it is a mistake to suppose that it entered into the conflict of Gallican and Ultramontane principles. Even the great Gallican champion Bossuet (q.v.) not only admitted the lawfulness of temporal sovereignty, but contended that it was in some sense necessary to the free exercise of his spiritual power, and to the independence of his ecclesiastical government. It was not until the aggression of the French Republic upon Rome, and the annexation of the papal provinces called the legations to the Cisalpine Republic, and afterward to the Kingdom of Italy, by Bonaparte, that the con-

trovery assumed practical interest. For a few years all of the papal territories were in the hands of Napoleon. More recently, upon the incorporation of the whole of the Papal States in the Kingdom of Italy, the question once more agitated the Catholic world, and is still a practical one. Most Roman Catholics, while admitting that the possession of temporal sovereignty is no essential part of the privileges of the successor of St. Peter, regard the possession of a sovereignty independent of any particular sovereign as the means providentially established for the protection of the spiritual independence of the Pope, and of the free exercise of his functions as spiritual ruler of the Church.

TEMRYUK, тѣм-рыук'. A seaport in the Province of Kuban, Ciscaucasia, Russia, on an inlet of the Sea of Azov, 90 miles west of Ye-katerinodar (Map: Russia, E 5). It has an extensive export trade in grain and flour. Pop., 1910, 17,731.

TEMUCO, тѣм-уко'. The capital town of the Province of Cautín, Chile, 140 miles southeast of the port of Concepción, with which it has railway communication, on the north bank of the river Imperial or Cautín (Map: Chile, E 5). The town has tanneries and breweries and carries on an important trade with the Araucanians of the vicinity. Pop., 1910, 16,037.

TEN, COUNCIL OF. See COUNCIL OF TEN.

TENAFLY, тѣн'а-ли. A borough in Bergen Co., N. J., 16 miles north of New York City, on the Erie Railroad (Map: New Jersey, E 2). It contains the Mary Fisher Home for the Aged, the Rethmore Home for Children, and the Happy Land Home for Children. Tenafly is essentially a residential place, but has manufactures of shades and decorative cloths. Pop., 1900, 1746; 1910, 2756; 1915 (State census), 3050.

TENAILLE, тѣ-на-и'. In fortification, a low work situated in the reëntering angle formed in the enceinte ditch by the curtain and flanks of the bastioned system. It is isolated from these parts of the enceinte by a ditch, and is designed to serve as a mask, protecting the scarp walls of this reëntering angle from fire, as well as the outlets to the enceinte ditch. A tenailed line, the reëntering angles of which are between 90 and 100 degrees, and the salient angles not less than 60 degrees, forms a tenailed system. Consult Mahan, revised by James Mercut, *Permanent Fortifications* (New York, 1888). See FORTIFICATION.

TENANCY, JOINT. See JOINT TENANCY.

TENANCY AT SUFFERANCE (OF. *tenance*, from Lat. *tenere*, to hold, retain). A legal term defining the occupation of land. When a tenant enters upon land lawfully, but continues in possession through the neglect of the landlord, he is a tenant at sufferance. Such is a holding over after a lease has expired, or the possession of land under a parol agreement of sale.

The distinction between such a tenancy and a tenancy at will has been lost sight of in modern law. The statutes of various states have defined the relationship of landlord and tenant, and in what manner a tenancy may be terminated and possession recovered. See LANDLORD AND TENANT; TENANCY AT WILL.

TENANCY AT WILL. A tenancy which is terminable at any time by either the landlord or the tenant. The term is used indiscriminately with tenancy at sufferance (q.v.), but the latter

means a holding without the expressed consent of the landlord, and the former a tenancy whose duration is uncertain. The death of either party or the alienation of the land, by deed or written lease, effects a termination of the tenancy. At common law a tenant at will was not entitled to notice to quit. It is now usually required. Any knowledge brought home to the tenant that may be construed as a notice to quit is sufficient, such as a demand of possession. Modern statutes provide the exact steps to be taken to dispossess a tenant at will. There being no definite term, assignments of leases at will are not valid, and operate as a notice of the tenant's election to terminate the tenancy. See LANDLORD AND TENANT.

TENANCY BY ENTIRETY. See ENTIRETY, TENANCY BY.

TENANCY IN COMMON. An interest or estate in real or personal property resting in joint possession and held by several persons at the same time by several and distinct titles. See COMMON, TENANCY IN; JOINT OWNERSHIP; and consult authorities referred to under REAL PROPERTY.

TENANT FOR LIFE. See LIFE ESTATE.

TENANT RIGHT. In English law a custom which is recognized in some districts in Ireland, under which a tenant is conceded the right to continue to occupy land upon which he has made improvements, practically indefinitely without the payment of an increased rent. By the Land Act of 1870 the custom was recognized. See LANDLORD AND TENANT.

TENASSERIM. The southernmost division of Lower Burma (see BURMA), bordering on Siam, and comprising the districts of Salwin, Amherst, Tavoy, Thaton, Toungu, and Mergui (Map: Burma, C 4). Tenasserim is a narrow strip of coast about 500 miles long, with a varying breadth of from 40 to 80 miles, extending from the Pakchan River northward to the Salwin. Area, 36,086 square miles. Pop., 1901, 1,137,776; 1911, 1,406,264.

TEN BRINK, JAN. See BRINK, JAN TEN.

TENCH (OF. *tenche*, Fr. *tanche*, from ML. *tenca*, Lat. *tinca*, *tenci*). A small European cyprinoid carplike fish (*Tinca vulgaris*), an inhabitant of ponds and stagnant waters. It is deep yellowish brown and usually about a foot long. Its flesh is poor. See PLATE OF CARPS AND ALLIES.

TENCIN, тѣн'сѣн', CLAUDINE ALEXANDRINE GUERIN DE (1681-1749). A French novelist, prominent in the literary society of the Regency. She was born at Grenoble, and was placed in the Convent of Montfleury as a novice, whence a sympathetic Lothario rescued her. She next appeared at Paris as an unscrupulous friend of Cardinal Dubois (1714), gathering about her a crowd of admirers, among them Fontenelle, Law, and the Regent. With the death of the Regent Orléans (1723) her influence waned. In 1726 she suffered a brief imprisonment in the Bastille because a desperate lover had killed himself in her house. Later her reputation revived; she became decorous and popular with her former friends, including Duclos, Lamotte, Marivaux, Marmontel, Montesquieu. She wrote three novels, mingling history with fiction: *Les mémoires du comte de Comminges* (1735), *Le siège de Calais* (1739), and *Les malheurs de l'amour* (1747), the last a bit of psychic autobiography. The strength of these tales lies in their scenes of dread and gloom. Her nearest literary an-

alogue is Madame de La Fayette (q.v.). Madame de Tencin was the mother, through one of her many illicit connections, of D'Alembert (q.v.). Her correspondence with her brother, Cardinal de Tencin (1680-1758), appeared in Paris in 1780, that with the Duke de Richelieu in 1806. Alleged *Mémoires secrets* were published by Barthélemy (Grenoble, 1790). Tencin's *Œuvres*, with those of Madame de Fontaines, were published by Garnier (Paris, 1864).

TEN COMMANDMENTS. See DECALOGUE.

TENDA, tēn'dà, COL DL. A pass over the Maritime Alps in Italy near the boundary of France and 25 miles from the Mediterranean coast (Map: Italy, A 2). Its altitude is 6145 feet, and it carries the railroad from Cuneo to Ventimiglia. The carriage road from Cuneo to Nice passes here through a tunnel nearly two miles long and lighted by electricity.

TENDAI-SHU, tēn-dī'shū (Chin. *T'ien-tai Tsung*, name of a mountain in China where the founder of the sect studied). A sect of Japanese Buddhists, established towards the end of the eighth century by a Japanese priest named Dengyo Daishi. Like all Japanese sects, it is of the Northern School, and is based upon the *Saddharma Pundarika*, or Lotus of the Good Law. Salvation lies in the perception of the original and absolute Buddha, of whom the historic Buddha is one manifestation. The means of salvation are meditation and wisdom. It has an exoteric teaching for the vulgar, while its esoteric doctrines are reserved for the monks, although the highest truths are recognized as transcending human comprehension. The sect is eclectic, and various Buddhas are worshiped in its temples. It completed the triumph of Buddhism in Japan by declaring that the Shinto deities are manifestations of Buddha. As it attempted in its teachings to reconcile contradictory doctrines, it gave rise to schism and became the mother of many sects. Its centre was on the mountain near Kyoto called Hiei-zan. Its priests, though devoted by profession to meditation, became very warlike in the Middle Ages. Nobunaga (q.v.) in 1571 A.D. destroyed the monastery, and killed the inhabitants. The sect never regained its commanding position. Consult Nanjō, *Short History of the Twelve Japanese Buddhist Sects* (London, 1887); W. E. Griffiths, *The Religions of Japan* (New York, 1895); G. W. Knox, *The Development of Religion in Japan* (ib., 1907).

TEN'DENCY (from Lat. *tendens*, pres. p. of *tendere*, to stretch, tend; connected with Gk. *telkein*, *teinein*, to stretch). A term in psychophysics denoting the nervous disposition which underlies some phase of mental constitution. Thus, perseverative tendency is the tendency of a nervous impression to persist, and of the correlated mental formation to reëmerge. Associative tendency is a connection between two impressions such that, if the one is reëxcited the other tends to be excited. Determining tendency (q.v.) represents a set of the nervous elements such that a course of successive associative tendencies is directed to some single end.

Tendencies are either natural, i.e., based on inheritance and transmitted through the nervous system, or they are acquired during the lifetime of the organism. The conditions for setting up impressional and associative tendencies are the secondary laws of association (see ASSOCIATION OF IDEAS), and determining tendencies are acquired either through habit or as the result

of some salient experience. See DISPOSITION; HABIT; MEMORY; MENTAL CONSTITUTION; TEMPERAMENT.

TEN'DER (from ME. *tender*, OF, Fr. *tendre*, from Lat. *tendere*, to stretch, extend). As a legal term the formal offer to perform an obligation under such circumstances as to make no further act necessary on the part of the person making the tender.

The term is frequently used with reference to the payment of money, but it includes any act, such as an offer to perform or to deliver goods. If the obligation is to pay money it must be made in legal tender (q.v.). The rule has been relaxed in some states and a tender of a check or bill of exchange is good unless the debtor rejects the tender on the ground that it is not lawful money. If the creditor prevents or specifically waives the tender the necessity is dispensed with. If the tender is a fulfillment of the obligation it is a complete defense to an action.

The debtor must keep the tender good and be ready at all times to perform. By statutes in many states, even after action is brought, he may pay into court the sum he admits to be due with interest and costs up to date. The sum so paid becomes the property of the creditor. If he does not accept it he proceeds at the risk of having costs awarded against him should the court determine such tender was sufficient. Consult A. P. Hunt, *Treatise on the Law of Tender* (St. Paul, 1903). See LEGAL TENDER; MORTGAGE; PLEDGE.

TENDILLA, COUNT OF. See MENDOZA, ANTOINE DE.

TEN'DON (from ML. *tendo*, *tendon*, from Lat. *tendere*, to stretch, extend). A term employed in anatomy to designate the structure of white fibrous tissue reaching from the end of a muscle to bone or some other structure which is to serve as a fixed attachment for it, or which it is intended to move. In accordance with their form, tendons have been divided into the three following varieties: (1) Funicular, or ropelike, as the long tendon of the biceps muscle of the arm; (2) fascicular, as the short tendon of that muscle, and as most tendons generally; and (3) aponeurotic, or tendinous expansions, sometimes of considerable extent, and serviceable in strengthening the walls of cavities, as, for example, the tendons of the abdominal muscles.

The tendons begin by separate fasciculi from the end of each muscular fibre, and they similarly terminate by separate fasciculi in distinct depressions in the bones, besides being closely incorporated with the periosteum. Tendons, together with their sheaths, are subject to acute and chronic inflammations and to tumor formation. The ordinary acute form of inflammation known as acute tenosynovitis is usually brought about by injury, such as a blow or by overuse. The chronic form of inflammation is usually tuberculous, though a rheumatic diathesis sometimes occurs. The tumors commonly observed in tendons are small fibrous and cartilaginous enlargements. Such growths occasionally assume a malignant character. When separation of a tendon occurs either by rupture or incision, if the divided ends are not too widely separated, repair takes place by the deposition of new fibrous tissue, closely resembling true tendon tissue. This repair is usually complete at the end of three weeks.

TEN'DRAC. See TENREC.

TENDRIL (Fr. *tendrille*, from *tendre*, tender, from Lat. *tener*, delicate; connected with *tenuis*, Gk. *ῥαβός*, *tanaos*). A slender, usually cylindrical organ of higher plants used for climbing. As to their origin, tendrils may occupy the position of leaflets, or of leaves, normally subtended by branches, or of branches usually subtended by leaves. The last two sorts, however, are not always easily distinguished. Some tendrils are coiled when young, unrolling as they mature; others are merely bent, or straight, or variously folded. At maturity they are usually slightly hooked near the apex.

Structurally, tendrils contain vascular bundles, surrounded by a cortex of thin walled and somewhat elongated parenchyma cells, covered by a delicate epidermis. (See HISTOLOGY.) Physiologically, they are sensitive to friction, often remarkably. Sensitiveness is ordinarily greatest on the concave side of the curved tip, though some tendrils are sensitive on the flanks and others sensitive on all sides. In tendrils sensitive on the concave flank a single stroke on this flank is followed by a rapid growth on the convex flank exactly opposite, also a great increase in the rate of growth in the middle line. This reaction is followed a little later by an autotropic straightening. Therefore, the total result of a single stroke leaves the tendril unaltered in shape. It is only by repeated strokes along much of the concave flank that the tendril finally closely grasps the support. The petioles of some leaves, e.g., *Clematis*, show a similar but less acute sensitiveness to friction, making one

TENDRILS OF BRYONIA.

a, a tendril that has attached itself and is coiling, with reversal of coils in centre; b, a recently attached tendril, the unequal growth just beginning; c, one just attached; d, one just straightened out; e, one still coiled from the bud.

turn about a support. *Uncaria* has short conical hooks, which are stimulated by contact and friction to grow in such a way that they enlarge greatly and curve about a support. Tendrils of wall-climbing ivies often form glandular disks that attach them. After a tendril has laid hold of an appropriate support the portion between the support and the axis of the plant is brought under strain, to which it responds by unequal growth on opposite flanks (on one side). By this means it is thrown into a spiral with one or more points of reversal (a mechanical necessity when a once straight cylindrical body

elongates on one side and so coils up). The coils develop mechanical tissues, and the most perfect tendril thus becomes a strong, uniformly coiled, elastic spiral spring which supports the plant. See LIANAS.

TENEBRÆ (Lat., darkness). A service in the Roman Catholic church; the matins of Thursday, Friday, and Saturday in Holy Week, generally sung on the preceding evening. The name is taken from the opening of the Responsorium following the fifth lesson on Good Friday, *Tenebræ factæ sunt*. The service consists of sixteen psalms and a canticle from the Old Testament, sung with their proper antiphons in fourteen divisions, nine lessons, nine responses, the canticle Benedictus, and the Miserere. Most of the service is in unisonous plain chant. At the conclusion of each psalm and antiphon one of the fifteen candles in the triangular candlestick used for this special service is extinguished with ceremony. During the singing of the Benedictus the six altar candles are put out one by one. The only light remaining is the candle at the apex of the candlestick. This is removed and carried behind the altar. After the singing of the antiphon, *Christus factus est pro nobis obediens usque ad mortem*, a silence follows during which the Paternoster is whispered in secret; after the Miserere a prayer is made and the candle is brought from behind the altar. Then, according to the rubric, "all rise and depart in silence."

TENEDOS. An island in the Aegean Sea, five miles from the northwest coast of Asia Minor. Its situation near the entrance of the Dardanelles gives it strategic importance (Map: Greece, G 4). Area, 16 square miles. The only town which bears the name of the island is inclosed by walls and has an old castle and remains of the storehouses erected by Justinian. The surface of the island is uneven and rocky, but the soil is fairly fertile. Wine is the most important product, about 5,000,000 gallons being annually exported. Population, about 4000, two-thirds of whom are Greeks. Tenedos was successively under the control of Persia, Athens, Rome, the Byzantine emperors, and Venice. It figured in the Trojan War. Since 1455 it has been a Turkish possession, and is included in the Archipelago Vilayet.

TENEMENT (Lat. *tenementum*, a holding, fief, from *tener*, to hold, retain). In the strict legal sense, anything of a permanent nature, corporeal or incorporeal, which may be held or be an object of tenure (q.v.). In the law of real property the term is used in a broad sense and denotes any estate or interest in land. Popularly, tenement means any rented house. See REAL PROPERTY.

TENEMENT-HOUSE AND HOUSING REGULATION. See TOWN PLANNING AND HOUSING.

TENEMENT-HOUSE LAW. The name by which are known various laws passed by municipalities in an effort to prevent unhealthy congestion of population. Perhaps the best known of these is the New York Tenement House Law of 1901, sometimes known as the "New Law." See APARTMENT HOUSE; BUILDING LAWS; CITY PLANNING; HOUSING PROBLEM; TOWN PLANNING AND HOUSING.

TENEMENT-HOUSE PROBLEM. The problem of the making possible a healthful human existence under the conditions of dense population in our modern cities. With the

growth of great cities, a double movement of population takes place. The well-to-do are driven from former residential districts by the encroachments of business, while working people crowd into their vacated houses. Rear tenements are built behind the old houses; new structures are put up solely for use as tenements; and the whole process is left in the hands of private builders and landlords, ill regulated by the municipality, until its two most obvious evils, the danger from epidemics and the danger from fire, force themselves upon public attention.

The first step in reform is legislation compelling the destruction or renovation of existing dwellings that are unsanitary, but it is equally important to provide for rehousing the displaced population, and to see that new tenements are properly built. These problems have been attacked by sociologists and legislators in nearly all centres where there is great congestion of population and are discussed under APARTMENT HOUSE; BUILDING LAWS; CITY PLANNING; HOUSING PROBLEM; TOWN PLANNING AND HOUSING.

TENERANI, tã'nã-rã'ně, PIETRO (1789-1869). An Italian sculptor, born at Torano, near Carrara. He studied at the Carrara Academy and later in Rome under Thorvaldsen, to whom he became a favorite assistant, and by whom he was strongly influenced. Tenerani was appointed professor at the Academy of St. Luke and was the leader of Roman art during the middle of the nineteenth century. His work is in the classicist style and is characterized by dignity, refinement, and harmony of line. Among his best-known sculptures are the group "Cupid and Venus" (Chatsworth); the bas-reliefs of "Charity" (Castle Ashby Church, Northamptonshire); the "Deposition from the Cross," in the Lateran (Rome); an "Angel of the Resurrection," in Santa Maria sopra Minerva, Rome (replica in the Friedenskirche, Potsdam); and the tomb of Pius VIII in St. Peter's. He was one of the first Italian sculptors to use modern costume for his fine portrait statues, which include those of Bolívar (Colombia, South America) and of Pellegrino Rossi (Carrara).

TEN'ERIFFE' (Sp. *Tenerife*). The largest of the Canary Islands (q.v.), a little west of the centre of the group, between the islands of Palma and Gran Canaria (Map: Spain, F 4). Area, 782 square miles. It consists of a nearly circular main portion from which a peninsula projects northeast. The latter consists of ancient, eroded, and forest-covered mountains, while the main portion rises into the magnificent Peak of Teneriffe or Pico de Teyde, a dormant volcano 12,192 feet high. The base of this enormous cone consists of pasture land interspersed with forests of chestnut and oak, but the steep upper slopes are covered with volcanic

scoriae, the summit being capped with snow in winter. The last serious eruption of the volcano occurred in 1910. The climate is mild and healthful, and dates, coconuts, and other tropical and northern fruits are cultivated, as well as grain, cotton, sugar, and grapes. Pop., 1900, 137,302; 1910, 180,307. The capital of the island and of the whole archipelago is Santa Cruz de Tenerife (q.v.).

TENERIFFE, MARQUIS OF. See WEYLER, N. V.

TENESMUS (Neo-Lat., from Lat. *tenesmos*, from Gk. *τενεσμός*, *tenesmos*, a straining at stool, from *τελννν*, *teinein*, to stretch). Pain referred to the rectum or bladder, due to the spasmodic contraction of the sphincter ani or sphincter vesicæ, and associated with an unsuccessful desire to evacuate the bowels or bladder. Rectal tenesmus is a constant symptom of dysentery (q.v.), and may accompany hemorrhoids, fissure, fistula, or malignant disease of the lower rectum. Causes of vesical tenesmus are chiefly cystitis (q.v.) and pressure on the bladder. Treatment will depend on the disease of which tenesmus is a symptom, but cold or hot applications, enemas containing laudanum, or suppositories of opium, cocaine, belladonna, or hyoscyamus will relieve the pain.

TEN'IA. See TAPEWORM.

TENIERS, tẽ-nẽrs'; often, as Fr., *te-nyã'*, or, as Eng., *tẽn'yẽr*, DAVID, the Elder (1582-1649). A Flemish genre and landscape painter. He was born at Antwerp, and studied with his brother Juliaen, under Rubens, and then with Elsheimer at Rome. Many of his early subjects, painted in the manner of Elsheimer, were landscapes with mythological figures, of which eight are in the Vienna Museum. He essayed also religious and mythological subjects, but his chief importance is as a genre painter, particularly of peasant scenes, kermesses, and the like, rendered with wholesome humor and in an individual style. Typical examples of his work are the "Temptation of Saint Anthony" (Berlin Museum); "Peasants Carousing in Front of a Tavern" (Darmstadt Gallery); and "A Dutch (properly Flemish) Kitchen" (Metropolitan Museum, New York). He is well represented also at Brussels, Munich, Dresden, St. Petersburg, Madrid, and in the National Gallery, London.

TENIERS, DAVID, the Younger (1610-90). The principal genre painter of the Flemish school. He was born at Antwerp, the son and pupil of the preceding. Before he was twenty his work bore the stamp of maturity, and in 1633 he entered the guild as master. His early manner and choice of subjects is represented by such examples as "The Prodigal Son" (Pinakothek, Munich), "The Five Senses" (Brussels Museum), "A Merry Repast" (Berlin Museum), and "The Misers" (1634, National Gallery, London). The delineations from peasant life, which thenceforth were his chief productions, show the influence of Adrian Brouwer, although there is no evidence of Teniers having been his pupil. Of more than 100 such pictures which Teniers painted, some of the most characteristic are: the "Interior of Village Inn," "Flemish Tap-Room" (1643); "Peasants' Dance" (1645); "The Smokers" (1650, all in the Pinakothek, Munich); "Hour of Rest" (Amsterdam), "Smoking Club" (Dresden), and "Backgammon Players" (1641, Berlin). Brouwer's spirit also prevails in subjects like "The Dentist" and "The Barber Shop" (both in Cassel), "The Village

Doctor" (Brussels); also in various treatments of "The Alchemist" (The Hague and Dresden), and of the "Temptation of Saint Anthony" (Brussels, Dresden, and—dated 1647—Berlin).

In 1637 Teniers married Anna Breughel, the daughter of Jan Breughel and ward of Rubens, who was one of the marriage witnesses. Soon after the death of Brouwer in 1638 the influence of Rubens became apparent in Teniers's coloring, which changed to a warm golden tone with rich and luminous local colors, and in the dramatic life animating his large compositions. This phase is well exemplified by a "Peasants' Dance" (1640, Berlin) and the "Flemish Kirmess" (1641, Dresden, Vienna, Madrid; 1652, Brussels and Amsterdam). Especially remarkable for the number of figures is "The Great Italian Fair" (Munich), and interesting portrait groups are represented in "The Artist and his Family" (c.1645, Berlin) and "Teniers in Front of his Castle near Perck" (National Gallery, London). In 1642 he was commissioned to paint for St. George's Guild an "Archers' Festival" (St. Petersburg), containing 45 characteristic portrait figures. A few scenes from military life are depicted in the fine "Guard Room" (Amsterdam), "Robbers Plundering a Village" (1648, Vienna), and "Relief of Valenciennes by the Spaniards" (Antwerp). His few religious paintings are unimportant.

After Teniers had, about 1643, become lord of the manor of Dry Toren (Three Towers), near Brussels, he seems to have been more than ever absorbed in rural life and work, as may be seen in the "Cow Stable," and "Goat House" (Vienna), especially noteworthy for their chiaroscuro. In 1644 he was chosen head of the painters' guild in Antwerp, appointed court painter to Archduke Leopold William, Regent of the Netherlands. He removed to Brussels in 1650. He depicted notable events in the life of the Archduke and his consort, Isabella, including the "Shooting Match at Brussels" (1652, Vienna), containing more than 470 figures. As director of Leopold's gallery he was in charge of extensive purchases, and he painted a series of interiors, faithfully representing these treasures to the minutest detail (Munich, Vienna, Madrid, and Brussels). Among the works of Teniers's later period are rural scenes and landscapes, besides his parodistic monkey pictures, of which three are in the Pinakothek, Munich. Unique among his works is the "Sacrament of the Miracle of St. Gudule" (Berlin), painted on white marble, the grain of which is visible through the colors. The Metropolitan Museum, New York, possesses a "Marriage Festival" and a "Temptation of Saint Anthony," and four others, two being landscapes after Bassano.

Teniers left in all about 900 paintings. Consult: Alfred von Würzbach, "David Teniers der Jüngere," in Robert Dohme, *Kunst und Künstler des Mittelalters*, vol. xx (Bielefeld, 1877); Adolph Rosenberg, "David Teniers der Jüngere," in *Künstler Monographien*, No. 8 (ib., 1895); *Masters in Art*, vol. viii (Boston, 1907); Roger Peyre, *David Teniers: Biographie Critique*, in "Les Grands Artistes" (Paris, 1911); Oscar Schellekens, *Les trois David Teniers* (Termonde, 1912).

TENIMBER. A group of islands in the Malay Archipelago. See TIMORLAUT.

TENINO, tā-nē'nō. A tribe of Shahaptian stock (q.v.) formerly claiming most of the Deschutes River country of northern Oregon,

and now gathered with other tribes upon Warm-spring reservation in the same region. In 1855 they made their first treaty with the government, and agreed to come upon their present reservation. See SHAHAPTIAN STOCK.

TEN KATE, JAN J. L. See KATE, JAN J. L. TEN.

TEN'LIE. See JACKAL.

TEN'NANT, CHARLES (1768-1838). A British chemist. He was born in Ochiltree, Scotland, and followed the trade of bleaching. While experimenting, he found that by passing chlorine into lime suspended in water, a product was obtained that possessed similar properties to the javelle water, then generally used as a bleaching agent. The new product was found to be much the cheaper. He was given a patent for his process in 1798, but was unable to protect it against frequent infringement. Later he patented a process for making bleaching powder by passing chlorine over slaked lime, a method that is still of commercial value and extended use. In 1800 he founded the St. Rollox Chemical Company in Glasgow.

TENNANT, FREDERICK ROBERT (1866-). A British theologian, born at Burslem, Staffordshire. He was educated at Caius College, Cambridge, and after teaching held various livings in the Church. At Cambridge he was Hulsean lecturer in 1901, lecturer on the philosophy of religion in 1907, and lecturer on theology and fellow of Trinity College after 1913. His publications include: *The Origin and Propagation of Sin* (1902; 2d ed., 1906); *Sources of the Doctrine of the Fall and Original Sin* (1903); *The Concept of Sin* (1912).

TENNANT, SMITHSON (1761-1815). An English chemist. He was born in Selby, Yorkshire, and was educated at Edinburgh and Cambridge (M.D., 1790). Devoting himself to scientific investigation, especially in agriculture and chemistry, he made a famous discovery of the elements iridium and osmium, which he found in the residues obtained in the purification of native platinum. In 1813 he was called to a chair of chemistry in Cambridge.

TENNANT, WILLIAM (1784-1848). A Scottish poet. He was born at Anstruther, Fifeshire, Scotland. A cripple almost from his birth, he naturally turned to study. In 1799 he entered the University of St. Andrews, which he left after two years to become clerk to his brother, a corn agent. The business proving unsuccessful, he was glad to accept in 1813 the situation of parish schoolmaster at Dumino, a small village about four miles from St. Andrews, with a salary of £40 a year. In 1812 he had published his *Anster Fair*, a poem of much sprightliness and humor. The piece gradually made its way, aided by a highly laudatory notice in the *Edinburgh Review*, from the pen of the then omnipotent Jeffrey. In 1816 Tennant became teacher of a school at Lasswade, near Edinburgh, whence three years afterward he was transferred to the Dollar Academy in Clackmannanshire. His attainments as a linguist were by this time extraordinary. In 1834 he was appointed professor of Oriental languages in the University of St. Andrews. In connection with his new duties he published a *Syrino and Chaldee Grammar* (1840). He died at Devon Grove, Oct. 14, 1848. Besides other miscellanies in verse, Tennant published: *The Thane of Fife, a Poem* (1822); *Cardinal Beaton, a Tragedy* (1823); and *John Baliol, a Drama* (1825). None of these later

*

DAVID TENIERS—THE RUSTIC WEDDING
FROM THE PAINTING IN THE PINAKOTHEK, MUNICH

*

productions increased the literary reputation which his first work had won for him. Consult Conolly, *Life of William Tennant* (Edinburgh, 1861).

TENNENT, GILBERT (1703-64). An American Presbyterian minister, born in County Armagh, Ireland. In 1718 he came to America with his father, William Tennent, who is known as the founder of a theological school at Neshaminy, Pa., called, because of the way it was housed, the Log College. Many eminent clergymen were trained there. Gilbert early assisted his father, studied medicine and theology, and was ordained pastor of a church in New Brunswick, N. J., in 1726. This connection he continued until 1743, though traveling and preaching with Whitefield in New England for several months. Then he founded and became pastor of a church in Philadelphia, with which he remained until his death. In 1753 he visited England with President Davies to obtain aid for the College of New Jersey (later Princeton) and raised \$1500. He published many sermons. For notices of Gilbert and other prominent members of the Tennent family, consult W. B. Sprague, *Annals of the American Pulpit*, vol. iv (New York, 1858).

TENNENT, SIR JAMES EMERSON (1804-69). A British traveler, politician, and author, born at Belfast, Ireland. He traveled through the Levant and Greece in 1824-25, and was a Liberal member of Parliament from 1832 to 1834, but from the latter year until 1845 was a Liberal-Conservative and follower of Sir Robert Peel. In 1842 he secured the passage of the bill granting copyrights to designers. He was secretary to the India Board (1841-43); civil secretary to the Ceylon colonial government (1845-50); and shortly after his return to England, again entered Parliament (1852). There he was successively secretary for the Poor Law Board (1852) and a joint secretary of the Board of Trade (1852-67). After resigning the latter post he was made Baronet. Under his original name of Emerson, to which he had added his wife's name, Tennent, Sir James published a number of books, including: *A Picture of Greece in 1825* (1826); *Christianity in Ceylon* (1850); *Ceylon: An Account of the Island* (2 vols., 1859); *Sketches of the Natural History of Ceylon* (1861); and *The Story of the Guns* (1865).

TENNESSEE, tĕn'ē-sē'. A south central State of the United States, popularly called the Volunteer State. It lies between lat. 34° 59' and 36° 41' N. and between long. 81° 37' and 90° 17' 27" W., and has an extreme length of 491.12 miles and an extreme breadth of 113.55 miles; its area is 42,022 square miles, of which 335 are water. It ranks as the thirty-fifth State in size.

Topography. The surface is divided into seven well-marked topographical regions. The easternmost is a belt with a maximum width of 10 to 15 miles—the Appalachian Mountain region. It is formed by the Great Smoky and Unaka Mountains, whose main ridges average 5000 feet in elevation and in places exceed 6000 feet. Mount Guyot has an elevation of 6636 feet. Next westward is the Great valley of East Tennessee, a depression 30 to 60 miles wide, consisting of an alternate succession of parallel ridges and valleys. Next to the west is the Cumberland plateau, with an average elevation of about 2000 feet and an extreme elevation of 3550 feet. The eastern edge of this plateau is a straight, abrupt scarp, but its western edge has been deeply crenulated by headwater stream

erosion. Next is the highland rim or plain, with an elevation of about 1000 feet along its eastern border and 600 or 800 feet along its western margin, which lies, for the most part, a few miles west of the Tennessee River in its northern course across the State. Within the highland plain and 300 to 400 feet below its level, in middle Tennessee, there is an oval depression about 125 miles long and 60 miles wide, known as the central basin. West of the highland plain is the West Tennessee plain, 600 to 800 feet high on its eastern border, with a westward slope to 300 or 400 feet where it overlooks the alluvial plain of the Mississippi. This latter is a narrow belt, largely swampy, with a depressed area in the north containing Reelfoot Lake.

Hydrography. The drainage of the entire State reaches the Mississippi River. The eastern portion is drained by the Tennessee River, which flows southwestward into Alabama, then turns and flows northward across the State. The Cumberland, heading in southeastern Kentucky, flows southwestward into the central basin, turns northward, like the Tennessee, and flows across western Kentucky to the Ohio. The West Tennessee plain is drained directly into the Mississippi through the Wolf, Hatchie, Forked Deer, and Obion rivers. The Cumberland and Tennessee, with a few of the larger tributaries of the latter in East Tennessee, are navigable, but are undergoing further improvement. Much power has been developed in the upper part of the Tennessee River and much more awaits development both on it and on the Cumberland.

Climate. The climate is usually mild and equable. The mean annual temperature is 58° F., and the variation from this is not over 2 or 3 degrees in any section, except the Appalachian region, where the mean is 45° F. July, with a mean of 78° F., is the hottest month, and January, with a mean of 38° F., the coldest. The maximum rarely exceeds 100° F., but has reached 106° F.; and the minimum seldom falls below 10° F., though zero is reached occasionally, and -30° F. has been recorded in the Cumberland plateau. The annual rainfall averages about 50 inches and is well distributed geographically. The average annual snowfall is about 8 inches. The prevailing winds are from the south and southwest.

Soils. The soils of the various topographic regions differ greatly because of differences in the nature of the underlying rocks. The alluvium of the Mississippi and other river bottoms forms the richest soil. The uplands along the Mississippi bluffs have a fertile soil of loess and brown loam that to the east becomes sandy, and near the Tennessee River is in places barren. Where the rocks of the highland plain are siliceous shales the soils are poor, but where they are limestone fertile soils result. The central basin and the eastern valley have very fertile limestone soils; the Cumberland plateau is poor and sandy; and the Appalachian region thin and stony on steep slopes and rich and deep in coves.

Flora. Numerous species of oak, as well as poplar (*Liriodendron tulipifera*), chestnut, maple, beech, hickory, walnut, locust, persimmon, and dogwood are common throughout the State. In the higher mountains white pine, birch, ash, and hemlock are also found. In the Cumberland plateau short-leaf pine is common. Red cedar is common in the central basin, and in the river swamps of the west cypress, red gum, swamp oak, and cottonwood are characteristic.

About 55 per cent of the area of the State is forested. The most valuable timber is in the mountain coves and the Mississippi swamps.

Geology. Differences in the kind and attitude of the rocks correspond with, and are largely responsible for, differences in topography. The only igneous rocks are small areas of Archean granite, gneiss, and schist in the northern half of the high ranges of the eastern boundary. Elsewhere along this eastern border the rocks are much folded and metamorphosed siliceous sediments of Cambrian age. The rocks of the Great valley are chiefly of Cambrian and Ordovician age, though the Silurian and Devonian also occur. Limestones and dolomite form the valleys and sandstones, cherts and shales the intervening ridges. The rocks of the Cumberland plateau are of Pennsylvanian age, chiefly sandstones and shales. They and all to the west of them are flat-lying, while all to the east are highly folded and faulted. Mississippian limestones and shales form the highland plain, and with Silurian and Devonian rocks form the rim, while Ordovician limestones form the floor, of the central basin. The Silurian and Devonian rocks are prominent in the western valley of the Tennessee River. The West Tennessee plain consists of unconsolidated sands and clays, the eastern part of which overlap the Paleozoics of the highland plain and are of Cretaceous age, while farther west they are of Tertiary and more recent age.

Mineral Resources. A belt of limonite iron ore occurs in the western part of the highland plain, while another occurs along the eastern edge of the Great valley, and elsewhere in this valley are large deposits of zinc, marble, and bauxite, which along its western side is an important belt of red hematite. Large copper deposits occur in the extreme southeast. The Cumberland plateau contains a number of valuable coal seams, while phosphate is found in the central basin and large clay deposits occur in West Tennessee. In 1914 Tennessee ranked twenty-fifth among the States in value of mineral products. Coal is the most important of the minerals, and in 1914, 5,943,258 tons, valued at \$6,776,573, were mined. Copper ranks second among the State's minerals, and in 1914 there were produced 18,737,656 pounds, valued at \$2,492,108. The metal is obtained from pyritic ores, from which a large quantity of sulphuric acid is obtained as a by-product. In the production of phosphate rock Tennessee ranks second in the Union, and in 1914 produced 483,203 tons, valued at \$1,822,770. Clay products were produced to the value of \$1,546,315. The production of iron ore, chiefly hematite and brown ore, amounted to 330,214 tons, valued at \$466,523. The pig iron produced was valued at \$2,150,452. This is not included in the total of the State's production. Quarrying is another of Tennessee's important mineral industries. The principal products are marble and limestone, the former of which stands in high repute for interior decoration. The value of the stone products in 1914 was \$1,932,462. Other mineral products of varying importance are clay products, zinc, mineral waters, and silver, cement, and lime. The total value of the mineral production in 1914 was \$19,645,213.

Agriculture. The total land area of Tennessee is approximately 26,679,680 acres, of which 20,041,657 were in farms in 1910, 10,890,484 acres being improved land. The number of farms in that year was 246,012, averaging 81.5

acres. The total value of all farm property, including land, buildings, implements, and machinery, domestic animals, and bees was \$612,520,836. The average value of land per acre was \$18.53 in that year. Of the total number of farmers in 1910, 144,951 were owners and managers and 101,061 tenants. The white farmers numbered 207,704 and the nonwhites 38,308, of whom 73,504 and 27,557 respectively were tenants. The total acreage operated by whites was 18,435,579 and by nonwhites 1,606,078.

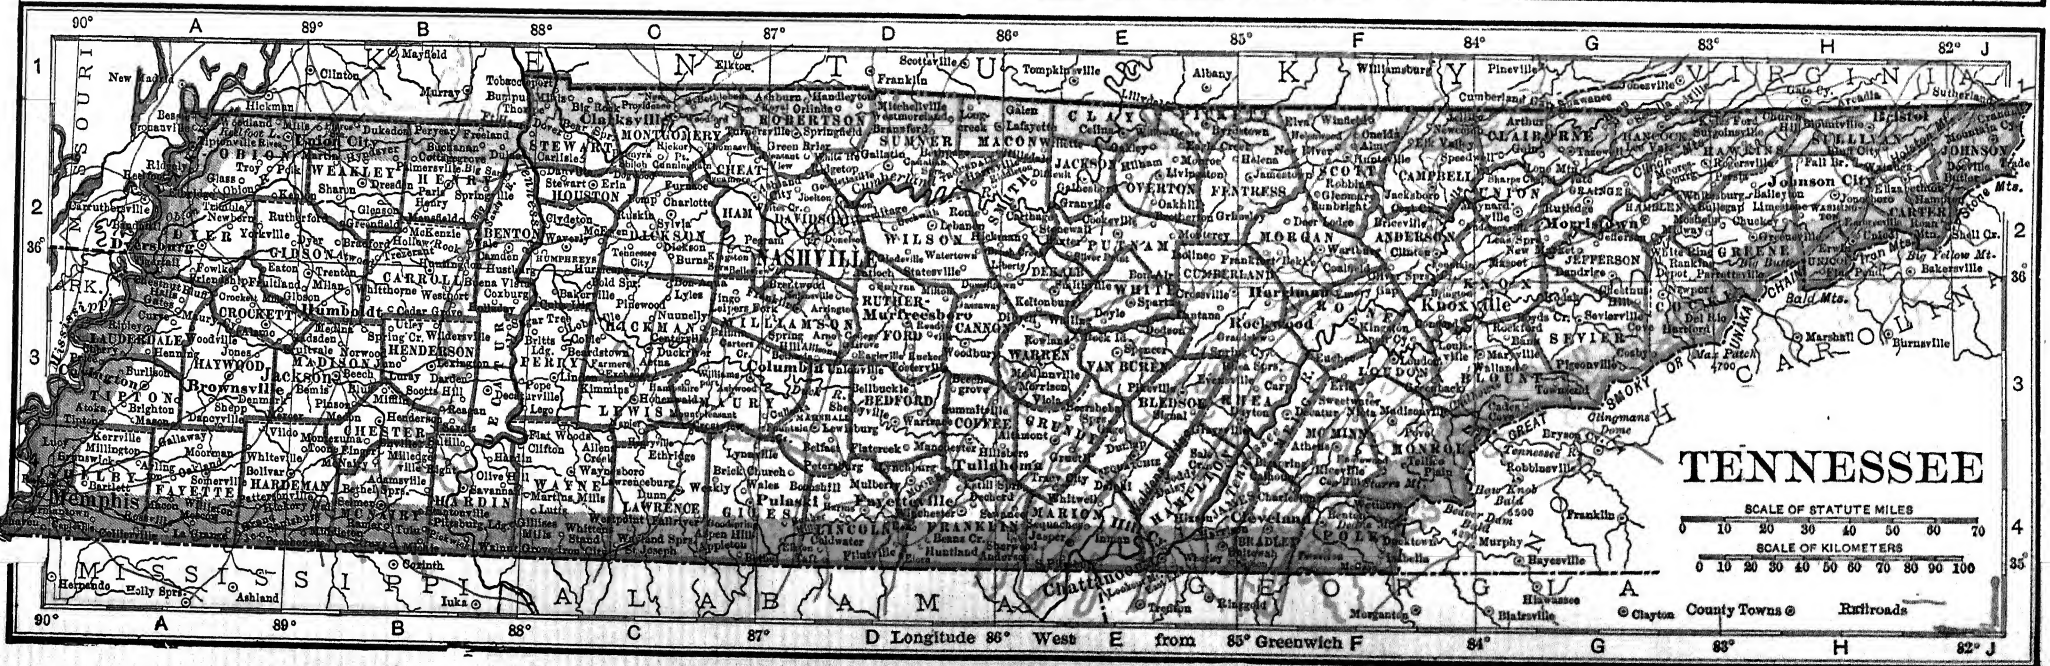

The acreage, production, and value of some of the principal crops as estimated by the United States Department of Agriculture for 1915 are as follows:

CROPS	Acreage	Production in bushels	Value
Corn.....	3,500,000	94,500,000	\$54,810,000
Wheat.....	860,000	9,030,000	9,752,000
Oats.....	357,000	8,746,000	4,373,000
Rye.....	18,000	189,000	195,000
Potatoes (Irish).....	36,000	3,168,000	1,996,000
Sweet potatoes.....	27,000	2,835,000	1,673,000
Hay.....	950,000	* 1,396,000	19,404,000
Tobacco.....	92,900	†69,675,000	4,390,000
Cotton.....	780,000	‡ 295,000	15,957,000

* Tons. † Pounds. ‡ Bales of 500 pounds gross weight.

The total value of all crops in 1909 was \$120,706,211. The leading crops in that year in order of importance were corn, cotton, hay and forage, wheat, tobacco, cottonseed, and oats. In 1909 corn had an acreage of 3,146,348 and a production of 67,682,489 bushels, valued at \$45,819,093. The acreage of cotton harvested was 787,516, and the production amounted to 264,562 bales, valued at \$17,966,517. Under hay and forage were cultivated 1,052,816 acres, which produced 1,077,836 tons, worth \$12,617,538. Wheat had an acreage of 619,861, the production amounting to 6,516,539 bushels, valued at \$6,913,335. The area cultivated for tobacco was 90,468 acres, from which were produced 68,756,599 pounds, valued at \$5,661,681. To potatoes were devoted 40,963 acres; the production was 2,922,713 bushels, valued at \$1,790,233. Sweet potatoes and yams had an acreage of 26,216 and a production of 2,504,490 bushels, estimated at \$1,625,056. Vegetables other than potatoes, sweet potatoes, and yams were grown over 100,055 acres, the production being valued at \$7,015,686. Small fruits produced in 1909 amounted to 13,895,493 quarts, valued at \$923,613. The acreage devoted to these was 12,539. Strawberries were the most important of the small fruits. Of the orchard fruits, apples and peaches were the most important. The total production in 1909 was 6,484,550 bushels, value \$3,459,077. Other fruits grown were grapes, pears, plums, cherries, quinces, mulberries, and figs. Total of sorghum cane and sirup produced in 1909 was \$1,146,000.

Live Stock and Dairy Products. In 1910 the total number of domestic animals reported was 4,465,500, valued at \$106,608,122. The United States Department of Agriculture estimated that on Jan. 1, 1916, horses numbered 349,000, value \$35,249,000; mules numbered 272,000, value \$30,736,000; milch cows numbered 366,000, value \$14,457,000; other cattle numbered 518,000, value \$11,707,000; sheep numbered 661,000, value \$2,710,000; swine numbered 1,531,000, value \$10,411,000. The production of wool in 1915 was 1,953,000 pounds. In 1910 the number of

fowls was reported as 8,056,145, value \$3,757,337. These produced 39,352,433 dozens of eggs, value \$6,793,640. The milk produced was reported at 117,101,970 gallons, and the butter made at 39,827,906 pounds. Total value of all milk, cream, and butter fat sold and butter and cheese made in 1909 was reported at \$8,715,441.

Forest Products. Tennessee is one of the most active lumbering States of the South. In 1908 there were about 15,000,000 acres of forest land whose trees represented over 100 varieties. (See *Flora*.) The number of active mills reported in 1913 was 1155, which produced 872,311 M feet board measure. Forest products produced on farms in 1909 were valued at \$8,510,710. The total value of lumber and timber products in 1909 was \$30,457,000. About 83 per cent of the products were hard wood. Most of this was oak, in the production of which Tennessee led the Union in that year. It also led in the production of yellow poplar and hickory.

Manufactures. In 1909 Tennessee ranked twenty-sixth in the Union in value of its manufactured products and the value per capita was \$82. The following table gives the more important details regarding manufactures for the 10 leading industries in 1909 and 1904:

SUMMARY OF MANUFACTURES FOR 1909 AND 1904

THE STATE — TEN LEADING INDUSTRIES

INDUSTRY	Census	Num-ber of establish-ments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manu-fac-ture
			Total	Wage earners (average number)				
All industries.....	1909	4,609	87,672	73,840	\$167,924	\$28,252	\$180,217	\$76,201
	1904	3,175	69,287	60,572	102,439	22,806	137,960	58,608
Cars and general shop construction and repairs by steam-rail-road companies.	1909	17	5,884	5,506	4,035	3,252	6,777	3,661
	1904	16	4,939	4,760	2,029	2,617	5,839	2,861
Cotton goods, including cotton small wares.	1909	17	3,164	3,078	7,454	857	5,201	1,857
	1904	16	2,362	2,294	5,113	531	3,561	1,320
Flour-mill and gristmill products	1909	454	2,658	1,577	8,511	559	29,070	3,784
	1904	387	2,429	1,595	6,927	591	25,351	3,439
Foundry and machine-shop products.	1909	124	4,694	4,041	9,253	2,006	9,190	4,630
	1904	100	3,716	3,313	4,616	2,482	6,124	3,270
Hosiery and knit goods.....	1909	22	3,229	3,117	3,055	724	3,565	1,445
	1904	16	1,855	1,810	1,160	341	1,628	659
Iron and steel, blast furnaces....	1909	13	1,268	1,143	7,122	519	4,653	1,272
	1904	13	1,486	1,358	5,688	546	3,428	819
Lumber and timber products....	1909	1,977	26,283	22,389	30,159	6,966	30,457	16,816
	1904	1,122	19,705	17,277	20,431	6,456	26,864	15,274
Oil, cottonseed, and cake.....	1909	20	957	806	3,371	290	6,583	1,392
	1904	20	819	701	2,914	245	3,744	660
Patent medicines and compounds and druggists' preparations.	1909	76	998	433	2,225	148	3,515	2,174
	1904	47	739	489	1,317	143	2,789	1,888
Printing and publishing.....	1909	413	4,442	2,914	6,493	1,701	7,173	5,219
	1904	310	3,373	2,330	4,415	1,231	5,091	3,768

The production of lumber and timber products is the most important industry in value of products, number of persons employed, and number of establishments. In 1909, 1,223,849 M feet board measure of rough lumber, 31,179,000 lath, and 35,392,000 shingles were produced. (See *Forest Products*.) In 1909 the flour and grist mills produced 2,999,501 barrels of white flour, valued at \$17,218,719; 1,981,746 barrels of corn meal and corn flour, valued at \$6,505,710; and 26,720,930 pounds of hominy, valued at \$441,371.

Of the total number of wage earners 64,648 were male. The wage earners under 16 years of age numbered 2445 of whom 813 were female. The prevailing hours of labor for about half the wage earners are 60 a week, and for about one-fourth from 54 to 60 a week. Leading cities and

the value of their products in 1909 are: Memphis, \$30,241,519; Nashville, \$29,649,697; Chattanooga, \$16,036,455; Knoxville, \$8,149,377, and Jackson, \$2,709,773. For further details, see these titles.

Transportation. Considerable water transportation is obtained on the Mississippi, Tennessee, and Cumberland rivers. A number of trunk-line railroads cross the State, most of them centring at Memphis and Nashville. The total mileage of all railroads in 1915 was 4165. The principal roads and their mileage are the Nashville, Chattanooga, and St. Louis, 900; the Louisville and Nashville, 861; the Southern, 764; the Tennessee Central, 292; the Cincinnati, New Orleans, and Texas Pacific, 142.

Banks. The first bank in the State was the Nashville Bank, established in 1807, with a capital of \$200,000. In 1838 the Bank of Tennessee was organized with a capital of \$5,000,000, all of which was to be supplied by the State, partly from funds on hand and partly by sale of bonds. It started with an actual capital of only \$2,073,355, which was all the State could get together. In 1866, by order of the Legislature, the Bank of Tennessee was formally placed in liquidation, when its assets of \$12,478,483 were found to

consist mainly of Confederate bonds, certificates, treasury bonds, etc. In 1883 the State finally assumed the liability for the bank notes, and

ITEMS	National banks	State banks
Number	116	404
Capital.....	\$14,375,000	\$14,897,911
Surplus.....	5,753,000	5,625,392
Cash, etc.....	5,178,000	13,190,955
Deposits.....	62,932,000	62,778,993
Loans.....	73,387,000	62,904,763

they were redeemed for special certificates of indebtedness. The depositors of the bank, including the State school fund, never realized any-

thing. The constitution prohibits the State forming a bank or even holding stock in one. The condition of the various banks in 1914 is shown on page 99.

Government. The constitution adopted in 1870 has not been amended in any important particulars. Amendments which may be proposed in either house must be passed by two consecutive assemblies and submitted to the people for approval. The Legislature, however, may not propose amendments to the constitution oftener than once every six years, but it may at any time submit to the people the question of calling a convention to alter, reform, or abolish the constitution.

Legislative.—The legislative authority is vested in a general assembly, consisting of the Senate and House of Representatives, members of which hold office for two years. The membership of the House of Representatives must never exceed 99. Senators are proportioned among the counties and districts and must not exceed one-third the number of Representatives.

Executive.—The supreme executive power is vested in the Governor, elected for two years, who must be 30 years of age, and a resident of the State seven years before his election. The Secretary of State is appointed by joint vote of the General Assembly and commissioned for a term of four years.

Judiciary.—The judicial power is vested in a supreme court, and a circuit court, chancery, and other inferior courts. The Supreme Court consists of five judges, of whom not more than two may reside in any one of the grand divisions, and who are elected by the qualified voters. Candidates must be 35 years of age and must have been residents of the State for five years. The term of service is eight years.

Suffrage and Elections.—Every male citizen 21 years of age or over, who has been a resident of the State for 12 months and of the county for six months, is entitled to vote. A State board of elections has general charge of conducting all elections. In all counties of 50,000 inhabitants and over, and in all civil districts of 2500 inhabitants or over, registration is an essential for voting. General registrations are held every two years. A corrupt practices act was passed in 1907.

Local and Municipal Government.—The unit of local government is the county. County officers are coroner and ranger. New counties may be established by the Legislature to consist of not less than 275 square miles, with a population of at least 700 qualified voters. Cities and towns are permitted to adopt a commission form of government. In 1916 the cities of Chattanooga, Knoxville, Memphis, Nashville, Bristol, Jackson, Lenoir, Lebanon, Murfreesboro, and Springfield had adopted this form of civic administration.

Miscellaneous Statutory and Constitutional Provisions.—The Legislature has no power to grant divorces, but may authorize the courts of justice to grant them. Intermarriage between whites and negroes is forbidden. No person shall at any time be required to perform any duties in the State on any day set apart by his religion as a day of rest. Gambling on horse races is prohibited. The State is under prohibition. See *History*.

Finances. The history of the public debt constitutes the most important and interesting part of the financial history of the State. The first

debt was created in 1832 and 1838 for the purpose of establishing State banks. Between 1840 and 1850 the State inaugurated the system of public improvements. Bonds were issued to turnpike and railroad companies for construction, and first mortgages were the usual guarantees. In 1861 the total amount of bonds outstanding was over \$18,000,000, and a war loan of \$3,000,000 was added. The four years of the Civil War destroyed the sources of State income, made payment of interest impossible, and swelled the total indebtedness considerably. In 1865 it rose to \$25,277,406, out of which \$5,169,740 was interest overdue. The current interest charges alone amounted to \$1,185,048, while the revenue was far below it, taxation inadequate, and the amount actually collected considerably less than the sum assessed. Most of the companies to which the bonds were issued failed to pay the interest. The carpet-bag régime that followed the Civil War did not improve matters. New bonds to the amount of \$3,408,000 were issued to 14 railroad companies in 1868, interest remained unpaid, and in 1869 the total debt reached \$30,896,504. Measures of relief were then passed by the Legislature; sale of the delinquent roads was authorized, and the solvent railroads were permitted to pay their debts in State bonds which were below par. By these means the debt was rapidly reduced to \$27,920,386 in 1874. Yet even then the State was unable to meet its obligations. Repudiation began to be talked of towards 1880, and, frightened by this agitation, the bondholders began to offer various plans of settlement. A plan of refunding at 50 per cent was agreed to by the bondholders and the Legislature in 1879, but was rejected by popular vote.

In that year the debt question was the main campaign issue, and the repudiation party lost. A final settlement was reached in 1883, when the State debt proper was scaled down 20–24 per cent and the railroad guarantee bonds 50 per cent. The total debt was reduced by this operation from \$28,000,000 to about \$15,000,000. The conversion was completed in 1890. On Dec. 20, 1914, the total State debt was \$11,752,667. The cash balance on Dec. 20, 1912, was \$785,120, the balance on Dec. 20, 1914, was \$172,410. The receipts during this period amounted to \$9,166,870 and the disbursements to \$9,779,579.

Militia. Males of militia age in 1910 numbered 428,088. The organized militia in 1915 included 110 officers and 1703 enlisted men. It consisted of a regiment of infantry, two separate battalions, a separate company of colored troops, a troop of cavalry, and a detachment of sanitary troops, including a field hospital.

Population. The population of Tennessee by periods is as follows: 1790, 35,691; 1810, 261,727; 1830, 681,904; 1850, 1,002,717; 1870, 1,258,520; 1890, 1,767,518; 1900, 2,020,616; 1910, 2,184,789; 1915, 2,271,379; 1920, 2,337,885. In 1910 the State ranked seventeenth in the Union, the density per square mile being 52.4. The urban population was 441,045. In that year there were 1,711,432 whites and 473,088 negroes; foreign-born whites formed only 0.8 per cent of the total. By sex the population was divided into 1,103,491 males and 1,081,298 females. Of the native population 13.5 were born outside of the State, most of whom came from Mississippi. The males of voting age numbered 552,668 in 1910. Memphis is the largest city; its population in 1910 was 141,105 and in 1915 (est.) 146,113. Other cities with their populations in 1910 and as estimated

for 1915 are Nashville, 110,364 and 115,978; Chattanooga, 44,604 and 58,576; Knoxville, 36,346 and 38,300; Jackson, 15,779 and 17,669.

Education. In 1910 the percentage of illiteracy in the population ten years of age and over was 13.6 per cent. The total number of illiterates in 1910 was 221,071. Among native whites of native parentage the percentage of illiteracy was 9.7 in 1910, among negroes it was 27.3. Of the school population 563,158 were native whites, 10,099 were foreign-born whites, and 163,397 were negroes. The report of the State Superintendent of Education for 1914 shows that on June 30 of that year the school population of the State was 776,895. The total enrollment in the public schools on the same date was 593,437. The total expenditure for schools during the year was \$6,064,353. The total enrollment of white children in 1914 was 468,106 and of colored children 115,381. The average daily attendance of whites was 346,676 and of colored children 83,077. There were in the State, in 1914, 134 high schools, in which were 492 teachers. The pupils in these schools were 9950, with an average daily attendance of 7400. Legislation aiming to bring about the consolidation of schools has been in force since 1912. There is a compulsory educational law. A uniform examination law for teachers was put into effect in 1914. Industrial work in high schools and in elementary schools in some instances has been inaugurated with satisfactory results. Several counties employ supervisors for rural schools. Preferential schools have also been established in several counties. State institutes are held each year for white and colored persons.

There are four normal schools in the State: the East Tennessee State Normal School at Johnson City, the Middle Tennessee State Normal School at Murfreesboro, the West Tennessee State Normal School at Memphis, and the Agricultural and Industrial State Normal School for colored pupils at Nashville. There are a large number of institutions of collegiate rank. The most important of these are the University of Tennessee, which is a part of the State system of education, situated at Knoxville, the University of Chattanooga at Chattanooga, Lincoln Memorial University at Cumberland Gap, Cumberland University at Lebanon, Maryville College at Maryville, Vanderbilt University at Nashville, Burritt College at Spencer, Milligan College at Milligan, and Carson and Newman at Jefferson City. These are all coeducational. Colleges for men only are King College at Bristol, Southwestern Presbyterian University at Clarksville, Christian Brothers College (Roman Catholic) at Memphis, and the University of the South at Sewanee. Colleges for women are Sullins College at Bristol, Howard College for Young Ladies at Gallatin, Memphis Conference Female Institute at Jackson, Tennessee College at Murfreesboro, Ward-Belmont College for Young Women at Nashville, Boscobel College at Nashville, Synodical College for Females at Rogersville. Colleges for negroes are Knoxville College at Knoxville, Fisk University at Nashville, and Waldon University at Nashville.

Charities and Corrections. Charitable and correctional institutions under the control of the Board of State Charities include the Eastern Hospital for the Insane and the Tennessee Deaf and Dumb School at Knoxville, Western Hospital for the Insane at Bolivar, the Central Hos-

pital for the Insane, the Tennessee Reformatory, the Tennessee Industrial School, Tennessee School for the Blind, and the two State prisons, all at Nashville, and a branch prison at Petros.

History. Probably De Soto (q.v.) reached the Mississippi at the present site of Memphis in 1541. La Salle, about 1682, built a fort at this point, and called it Fort Prud'homme. The place was again occupied by the French in 1714. The grant by Charles II to the Lords Proprietors of Carolina of the territory between lat. 29° and 36° 30' N. in 1665 included this territory. (See NORTH CAROLINA.) The first English settlement was Fort Loudon, built in 1756, at the suggestion of Governor Loudon of Virginia, and garrisoned by royal troops, but afterward captured by the Cherokees. Before this, however, Dr. Thomas Walker with a party of Virginians had named the Cumberland River and Mountains, and Daniel Boone (q.v.) and others had entered the wilderness, then regarded as a common hunting ground by the Cherokees, Creeks, Miamis, Choctaws, and Chickasaws. In 1768 the Iroquois, who claimed sovereignty by conquest, ceded their claim to the English, and in 1769 William Bean's cabin on the Watauga marked the first settlement. James Robertson (q.v.) and others came in 1770, another settlement was made near Rogersville in 1771, and soon after Jacob Brown opened a store on the Nolichucky. After the defeat of the Regulators (q.v.) in North Carolina a number of settlers came, supposing the territory to be Virginia soil. When the territory was found to be within North Carolina, the inhabitants of the first two settlements met in 1772 and formed the Watauga Association (q.v.), which served as a form of government for several years. In 1775 Col. Richard Henderson (q.v.) bought from the Indians the territory between the Cumberland and the Kentucky rivers. More settlers came in 1778-79 and in 1780 a compact of government was drawn up at Nashborough, by Colonel Henderson, who had been Chief Justice of North Carolina, and James Robertson, who had been one of the signers of the Watauga Association. These two compacts were much alike and served their purpose excellently.

The Watauga settlers in 1775 or 1776 gave the name Washington District to their colony, and in 1776 it was annexed to North Carolina, though some had dreamed of a separate State. The number of settlers increased rapidly, and nearly 500 men under John Sevier (q.v.) and Isaac Shelby (q.v.) went across the mountains and took part in the attack on the British under Ferguson, at King's Mountain (q.v.), in 1780. All this time the settlers were harassed by severe Indian wars. In 1784 North Carolina ceded to the general government all the territory of the present State on condition that the cession be accepted within two years, but retained until that time full sovereignty. The inhabitants, indignant at being transferred without their consent, and thinking that they had been abandoned, elected delegates from each military company, who met at Jonesboro, Aug. 23, 1784, and formed the State of Franklin, or Frankland; John Sevier was chosen Governor. Congress ignored the request to be recognized as a State and North Carolina promptly repealed the act of cession and asserted its jurisdiction. Civil war was averted by the tact of the North Carolina governors. Confusion, however, reigned, as there were two bodies of officers, and many settlers neglected to

pay taxes to either, though furs, skins, and other articles were made legal tender by the infant State. At the expiration of Sevier's term in 1788 the State of Franklin ended. In this attempt at statehood the Cumberland settlers did not join. Davidson County was laid out in 1783 and the Davidson Academy (now the University of Nashville) was founded in 1785. Indian troubles threatened the life of the settlement, and the intrigues of the Spaniards, who still held Louisiana and the Mississippi, made the position more difficult. See MCGILLIVRAY, ALEXANDER.

In February, 1790, North Carolina again ceded the territory to the general government, stipulating that all the advantages of the Ordinance of 1787 (q.v.) should be preserved to the inhabitants, except that slavery should not be prohibited. The act of government for the territory south of the Ohio was passed in April, 1790, and the seat of government was moved from Rogersville to Knoxville. The Indians were severely punished in 1794 and the Spanish influence was broken. In the same year the first territorial assembly met. In 1795, as the territory was found to contain more than 60,000 white inhabitants, a constitutional convention was called, which met in January, 1796. A constitution for the State of Tennessee modeled after that of North Carolina was adopted without submission to popular vote; the first General Assembly met March 28, and the State was admitted June 1, 1796. Almost from the date of admission there was a sharp distinction between East and Middle (West) Tennessee, which was recognized in the appointment of the judiciary. In wealth and material progress the mountainous eastern part lagged. The western part of the State began to fill up after 1818, Memphis was laid out in 1819, and three sections came now to be recognized in law. The State's progress was rapid, though growth was almost entirely along agricultural lines. Construction of internal improvements began early. Turnpike roads were built in 1804, and after 1823 roads and canals were pushed forward. The first railroad was chartered in 1831, but the Memphis and Charleston road was not built until 1857. Much State aid was voted the railroads, and the redemption of the bonds issued for this was a political issue as late as 1892. The eastern part of the State did not share equally in these benefits.

There was a strong Union party in Tennessee at the outbreak of the Civil War, and in February, 1861, the people refused to hold a convention to consider secession, but with President Lincoln's call for troops sentiment changed, and through the influence of Governor Harris the State declared itself by popular vote out of the Union, June 8, though East Tennessee had voted against secession more than two to one. On June 17 a Union convention of delegates from the eastern counties and a few middle counties met at Greeneville and petitioned to be allowed to form a separate State. The request was ignored by the Legislature, and the presence of a Confederate army prevented further action on the part of the Unionists. During the war the State furnished about 115,000 soldiers to the Confederate cause and 31,092 to the Federal army. When the advance of Federal troops drove Governor Harris from Nashville, Andrew Johnson (q.v.), who had refused to resign his seat in the United States Senate on the secession

of the State, was appointed military governor. He attempted to reorganize the State in 1864, and set up Lincoln electors, who were rejected by Congress. In 1865 the radical Legislature proceeded to extreme measures. Suffrage was extended to negroes under the Constitution of 1834, which gave that right to every freeman. The State was readmitted July 23, 1866, but there was much disorder. The Ku-Klux Klan (q.v.) appeared, and in 1869 nine counties in Middle and West Tennessee were declared under martial law. For a time after the war the recovery of the State was slow, but more recent development has been exceedingly rapid. The principal events have been the conflicts between convict and free labor in the mines in 1891-93, and the Tennessee Centennial Exposition (q.v.), held at Nashville in 1897.

The vote for President in 1908 was Bryan, 135,819; Taft, 118,519; for Governor, Patterson, Democrat, 113,913; G. M. Tillman, Republican, 113,033. A State-wide prohibition bill was passed over the Governor's veto in 1909, and the same Legislature enacted measures prohibiting the manufacture of intoxicants within the State after Jan. 1, 1910.

Opposition to Governor Patterson divided his party with the result that the governorship went to the Republicans in the election of 1910. Captain B. W. Hooper defeated Robert L. Taylor by a vote of 133,999 to 121,674. Governor Hooper was reelected in 1912, defeating Benton McMillin. In the presidential election of that year Wilson received 135,399 votes, Taft, 60,674, and Roosevelt, 53,986. The Democrats regained their strength and in the election of 1914 Thomas C. Rye defeated Governor Hooper by a vote of 136,816 to 115,821.

In the presidential elections Tennessee chose Democratic-Republican electors from 1796 to 1824. In 1828 and again in 1832 the only issue was Jackson, and the voters were almost unanimous for him. In 1836, however, Hugh Lawson White, the States-Rights Democrat, was successful in spite of Jackson's efforts. From 1840 to 1852 Whig electors were chosen, Clay receiving the vote in 1844, though Polk was a resident of the State. In 1856 the vote was cast for Buchanan. The constitutional Union ticket headed by John Bell was successful in 1860. The State voted for Grant in 1868. The State has been consistently Democratic since then, with the exceptions of 1880 and 1910 when Republican governors were elected. From the State have come many men of national reputation, including three Presidents, Jackson, Polk, and Johnson.

TENNESSEE, THE. A formidable Confederate ram crippled by the *Hartford* of Admiral Farragut's fleet, and taken in Mobile Bay on Aug. 5, 1864.

TENNESSEE, UNIVERSITY OF. A coeducational State institution, founded in 1794 as Blount College. Its title was changed in 1807 to East Tennessee College, in 1840 to East Tennessee University, and in 1879 to its present name. The institution comprises a graduate department, a college of liberal arts, a college of engineering, a college of agriculture, a college of law, a school of commerce, and a school of education, all located at Knoxville; and a college of medicine, a college of dentistry, and a school of pharmacy, located at Memphis. There are the usual four-year courses in arts, engineering, agriculture, commerce, medicine, etc. In addition to these there is a three years' course in law and one in dentistry, and two years' courses in agriculture, pharmacy, and preliminary to medicine. Short courses are offered to farmers, extending through six weeks in the winter. The Summer School of the South is conducted at the University of Tennessee. It has very successful sessions, the attendance generally reaching nearly two thousand, this number having been several times exceeded. The

University has a liberal system of accrediting schools, whose certificates are accepted in place of the usual entrance examinations. Tuition in liberal arts, engineering, agriculture, commerce, and education is free to Tennesseans. The attendance in 1916 was about 1200, and the faculty numbered over 200. The library contained about 40,000 volumes. The endowment was about \$425,000, and the income about \$250,000. The grounds and buildings are valued at more than \$1,000,000. The President in 1916 was Brown Ayres, Ph.D., LL.D., D.C.L., who was elected in 1904.

TENNESSEE CENTENNIAL EXPOSITION. An exposition held in Nashville, Tenn., May 1 to Oct. 30, 1897, to celebrate the one hundredth anniversary of the admission of the State into the Union. The site covered about 200 acres, and a characteristic feature of the landscape plan was the sward planted with the famous blue grass of the region. The buildings, of which there were over a hundred, included those devoted to agriculture, commerce, education, fine arts, history, machinery, minerals and forestry, and transportation, as well as those in which the special exhibits pertaining to children, negroes, the United States government, and women were shown. The total attendance was 1,786,714, of which the total paid attendance was 1,166,692. The total receipts were \$1,101,285, and the disbursements \$1,101,246. Consult Justi, *Official History of the Tennessee Centennial Exposition* (Nashville, 1898).

TENNESSEE RIVER. The largest tributary of the Ohio River. It is formed by the confluence of the Holston and the French Broad rivers, about four miles east of Knoxville (Map: Tennessee, F 3). Thence it flows southwestward, enters into Alabama about 40 miles below Chattanooga, Tenn., and after crossing the northern part of Alabama again enters Tennessee in Harding County, whence it flows northward across Tennessee and Kentucky, and enters the Ohio at Paducah, about 40 miles above Cairo. Including the Holston, its length is about 1200 miles. Its drainage basin includes about 39,000 square miles. A canal having been constructed (1889) around the Muscle Shoals, between Florence and Decatur, Ala., the main stream is now navigable for 673 miles from its mouth. Its chief affluents are the Clinch, Hiwassee, Sequatchie, Elk, and Duck rivers. The river takes its name from the old Cherokee Indian town, Tennessee, which stood near the present town of Lenoir, Tenn.

TENNIEL, tēn'yel, SIR JOHN (1820-1914). An English cartoonist and illustrator. He was born in London, and was practically self-taught. In 1845 he won a prize in the competition for the decoration of Westminster Palace, with a cartoon, "Allegory of Justice," the success of which also secured for him the commission to paint a fresco, Dryden's "Saint Cecilia," in the House of Lords, but he soon devoted his time entirely to work in black and white, upon which his success rests. From 1851 to 1901 he was cartoonist for *Punch*, executing about 2300 cartoons, and also innumerable small drawings and designs for *Punch's Almanac* and *Punch's Pocket-books*. His work is characterized by correct draftsmanship, and by originality and freshness of invention, combined with dignity of conception. His satire is genial, and the statuesque beauty of his ideal subjects shows German influence. He was knighted in 1893. Among

his principal book illustrations are those for *Æsop's Fables* (1848); Moore's *Lalla Rookh* (1861); Lewis Carroll's *Alice's Adventures in Wonderland* (1866) and its sequel, *Through the Looking Glass* (1870); the *Ingoldsby Legends*; and his classical illustrations to the *Legendary Ballads*. In collaboration he illustrated: *Poets of the Nineteenth Century* (1857); *Poe's Works* (1859); the *Arabian Nights* (1863); *Legends and Lyrics* (1865).

TENNIS. A game played with racquet and ball in a covered court, inclosed by four walls. A net with each end higher than the middle is stretched across the court midway between the end walls. The divisions made by the net are termed the "service side" and the "hazard side." Points of vantage reserved for the spectators include the "dedans," an opening, covered with netting, in the wall at the service end. The main wall (on the right of the service side) is clear, with the exception of a buttress (called the "tambour") on the hazard side. The other three walls have penthouses, whose roofs slope downward. The walls should be 30 feet high, the length of the court about 94 feet, and its width about 31 feet at the dedans wall and about 30 feet at the grille wall, exclusive of the penthouses. The racquets used are strong and heavy, with long handles, large face, and a bulging side. The interior of the ball is of cloth and it is therefore heavier, though of the size and of the same color as the lawn-tennis ball.

The play is too complicated to be described here in detail, but in a general way it may be explained that, to be fairly served, the ball must be struck from the service court directly onto the roof of the left penthouse; or to the wall above it, and must then rebound into the hazard side in the court bounded by the pass line and the winning (last) gallery; otherwise it is a pass or a foul. If the ball goes to the grille side of the pass line the play is termed a "pass." Unless a pass has occurred, the striker-out may volley a service, provided the ball has not touched the penthouse on the grille side, and if there is no danger of injuring the server. The serve is counted as in lawn tennis (q.v.). Consult *Court Games*, edited by F. R. Toombs, in "Spalding's Athletic Library" (ib., issued annually), and "Tennis" in the *Encyclopædia of Sport* (London, 1911). SEE LAWN TENNIS.

TENNIS ELBOW. See NEUROSIS.

TENNO, JIMMU. See JIMMU TENNO.

TENNYSON, ALFRED, first BARON TENNYSON (1809-92). The most representative English poet of Victoria's reign. He was born on August 6, 1809, at Somersby, in Lincolnshire, a village of which his father was rector. Two of his brothers also displayed no slight poetic gifts, Frederick (q.v.), and Charles, afterward known as Charles Tennyson Turner (q.v.). Alfred spent four years (1816-20) at the grammar school of Louth, a few miles from his home, and for the next eight years his education was directed by his father, a man of some literary talent. He roamed the country round, delighting in the rural charm of the neighborhood, and laying the foundations of that full and minute knowledge of nature for which his verse is conspicuous, read extensively, and tried his hand in the manner of Pope, Thomson, Scott, Moore, and Byron. Fragments of this early work found their way into *Poems by Two Brothers* (1827; reprinted 1893), written in conjunction with his

brother Charles. In 1828 the two brothers entered Trinity College, Cambridge, to which Frederick had gone a year earlier. At the university Tennyson was associated with a remarkable group of young men, most of whom formed the famous society known as The Apostles. To this group belonged Thackeray, Spedding, Trench, Monckton Milnes, afterward Lord Houghton, Merivale, Alford, and Arthur Henry Hallam, son of the historian, who discerned his friend's genius and in 1829 told Gladstone that Tennyson "promised fair to be the greatest poet of our generation, perhaps of our century."

In that same year, with *Timbuctoo*, a poem in blank verse, Tennyson won the Chancellor's gold medal, and while still in residence published the epoch-making volume of *Poems, Chiefly Lyrical*. In 1830, when the slim little book appeared, poetry seemed to be dead, and the novel, under the impulse of the unprecedented success of the *Waverley* series, held the field. Showing the influence of Coleridge and Keats, the poems in this volume were by no means essentially imitative; rather, they contain in germ nearly all of Tennyson's great original qualities. In the same year he traveled in the Pyrenees with Hallam, and there, in the valley of Caunterets, he wrote parts of "Enone."

He left Cambridge without a degree in February, 1831, for various reasons, but chiefly the ill health of his father, who died a few weeks later. The family, however, remained at Somersby for six years longer. The second volume of *Poems* (1833) contained many of his choicest minor pieces: "The Lady of Shalott," "The Miller's Daughter," "The Palace of Art," "The Lotus-Eaters," and "A Dream of Fair Women." Except by his friends, the collection was not well received; Lockhart wrote an especially brutal review in the *Quarterly* for April. In September a lifelong sorrow fell upon the poet in the death of Hallam, his dearest friend, who was engaged to his sister Emily. For ten years he remained silent, reading largely, revising old poems, and writing new ones. By 1836 he had definitely given his heart to his future wife, Emily Sarah Sellwood, the sister of his brother Charles's wife. But, though deficiency of income seemed an insuperable bar to marriage, and though her relatives forbade even correspondence, Tennyson had no thought of deserting the art to which his life belonged to take up a profession more lucrative.

In 1842 he gained his public with *Poems* in two volumes, representing a wide range of theme and metrical structure. Here first appeared "Morte d'Arthur," the first sketch of the *Idylls of the King*; "Ulysses," "Locksley Hall," "Godiva," "Break, break, break," and "The Two Voices." Tennyson's place in English poetry was now secure; but fortune seemed far off. His capital was shattered by a strange investment in wood-carving machinery; and in 1845 Peel was moved by Lord Houghton to grant him a civil-list pension of £200. In 1847 appeared *The Princess*, a romantic medley in musical blank verse, marked by his "curious felicity" of style, and containing, in its third (1850) edition, some wonderful lyrics. The year 1850 has been called his *annus mirabilis*. In June he published *In Memoriam*, a tribute to the memory of Arthur Hallam. At first not well understood, it has now definitely taken its place with *Lycidas*, *Adonais*, and *Thyrsis* among the great English elegies. In the same month he married Miss

*

TENNYSON
FROM AN ETCHING BY PAUL RAJON

Sellwood (with whom, he said afterward, "the peace of God came into my life"); and in November he was appointed poet laureate, succeeding Wordsworth. He settled with his bride at Twickenham, where he lived until (in 1853) he leased and shortly afterward purchased the estate of Farringford, near Freshwater, in the Isle of Wight, where he was wont to live for a part at least of each year for the rest of his life. After 1870 he divided his time between Farringford and Aldworth, a house which he built on Blackdown Hill, near Haslemere.

In 1855 appeared *Maud*, and *Other Poems*. "Maud," a great favorite with Tennyson, puzzled the critics, who tried to find in it the result of the author's own experience, though it is rather a vivid dramatic conception, rare with Tennyson. "No modern poem," said Jowett, "contains more lines that ring in the ears of men." The same volume contained the popular "Brook" and "The Charge of the Light Brigade." Returning to Arthurian legend, Tennyson published in 1859 four of the *Idylls of the King*; others were added in 1869, and in 1872 they were arranged in sequence, with a completion in "Balin and Balan" (1885). Though his conception of the Arthurian romances has been severely criticized, and though it must be confessed that his favorite heroes have here something of the aspect of carpet knights, the *Idylls* still remain on the whole a fine achievement and in scattered passages quite above criticism. *Enoch Arden* (1864) was the most immediately popular of all his volumes; sixty thousand copies were sold, and the title poem was translated into eight languages: From the epic Tennyson turned to the drama, producing *Queen Mary* (1875), *Harold* (1876), and *Becket* (1844). Besides these imposing historical pieces are *The Falcon* (1884), *The Cup* (1884), *The Promise of May* (1886), and *The Foresters* (1892), of which *The Cup* was the most successful as an acting play. Tennyson's productive imagination continued active throughout his last years. His last volumes were *Ballads and Other Poems* (1880), containing "Rizpah" and "The Northern Cobbler"; *Tiresias and Other Poems* (1885); *Demeter and Other Poems* (1889), containing "Crossing the Bar"; and the posthumous *Death of Enone and Other Poems* (1892).

In 1884, after some hesitation, the poet accepted a peerage. He died at Aldworth, Oct. 6, 1892, and was buried in Westminster Abbey.

No English poet has produced masterpieces in so many different kinds as Tennyson; he is the representative figure in literature of the Victorian era, because he touched and reconciled a greater number of its diverse interests than any other writer. Yet he is in constant protest against the individualism which that period inherited from the Romantic revival. The most salient feature of his mental attitude is his sense of law; it is the "reign of law" as shown by modern science which most attracts him to scientific subjects. The consummate artistic excellence of his verse, resembling in many of its qualities that of Vergil, gives him an abiding place in literature. No better example exists in English of the eclectic style made up of elements inherited from many of his great predecessors, emulating "by turns the sweet felicity of Keats, the tender simplicity of Wordsworth, the straightforward vigor of Burns, the elusive melody and dreamlike magic of Coleridge, the stormy sweep of Byron, the large majesty of

Milton"; and he expressed, with such an instrument, a teaching which was uniformly pure, noble, and consoling.

Rawnsley, *Memoirs of the Tennysons* (New York, 1912); Oliver Huckel, *Through England with Tennyson* (ib., 1913).

TENNYSON, CHARLES. See TURNER, CHARLES TENNYSON.

TENNYSON, FREDERICK (1807-98). An English poet, brother of Alfred Tennyson (q.v.), born at Louth, in Lincolnshire. In 1827 he left Eton, as captain of the school, and went up to

Trinity College, Cambridge, where he graduated in 1832. He passed most of his time for many years on the Continent, living for a long period at Florence. In 1859 he settled in the Isle of Jersey, where he remained until 1896. He then removed to Kensington, where he died. With his brothers, Alfred and Charles, Frederick wrote verse before his college days. To their *Poems by Two Brothers* (1827) he contributed four poems. In 1854 he published *Days and Hours*, which contained several beautiful and noble lyrics. In 1890 appeared *The Isles of Greece*; in 1891, *Daphne and Other Poems*; and *Poems of the Day and Year* (1895). His *Shorter Poems*, with an introduction by Charles B. L. Tennyson, were collected in 1913. Alfred Tennyson said that his brother's poems "were organ-tones echoing among the mountains."

TENNYSON, HALLAM, second **BARON TENNYSON** (1852-). Eldest son of the poet, Alfred, Lord Tennyson (q.v.). He was born at Twickenham, was educated at Marlborough College, and at Trinity College, Cambridge, and studied law at the Inner Temple, after which he was for some years his father's private secretary. To the *Contemporary Review* for November, 1876, he contributed a translation of the old English song of *Brunanburh*, which was afterward turned into verse by his father. In 1880 he edited, with an introduction, the sonnets and lyrics of his uncle Charles Tennyson Turner (q.v.); and in 1897 he published the authorized life of his father, under the title *Alfred, Lord Tennyson: A Memoir*. Governor of South Australia from 1899 to 1902, he was then Governor-General of the Commonwealth of Australia for two years. He received the G.C.M.G. and honorary degrees from Oxford and Cambridge. In 1908 he brought out the Eversley edition of his father's complete works, which contained notes by his father and by himself; and in 1912 appeared *Tennyson and his Friends*, edited by him, a work abounding in personal anecdote and literary reminiscence.

TENOCHTITLAN, tē-nōch'tēt-lān'. The ancient capital of the Aztecs, occupying the site of the present city of Mexico (q.v.).

TENOR (OF. *tenour*, *teneur*, from ML. *tenor*, chief melody, highest male voice to which this was assigned, Lat. *tenor*, a holding, tone, accent, from *tenere*, to hold, retain). In music, one of the classes into which voices are divided in respect to their compass. It is the highest adult male voice, with an approximate range from c to a'. Music for tenor voices is generally written in the treble clef, or an octave higher than its true pitch. The sign of the C clef is also often used, but it is not placed on the second line, but second space, so that the music is read as in the treble clef, but an octave lower. Two classes of tenors can be recognized, the heroic and lyric tenors (*tenore robusto*, *tenore di grazia*). The heroic tenors have something of the sonorous quality of the barytone in the lower register.

TE'NOS, or **TINOS**, tē'nōs. An island in the Ægean Sea belonging to the Cyclades (q.v.) and known as one of the most productive in the group (Map: Greece, G 6). It has an uneven surface and covers an area of 79 square miles. On the south coast is the little town of the same name, called also Hagios Nikolaos (St. Nicholas). It is on the site of the ancient town of Tenos, the remains of whose temple of Poseidon were laid bare in 1902. The chief industries are

wine making and marble quarrying. Corn grows in abundance and fig exportation is important. Pop., 1906, 12,300. Tenos played an active part in the struggle between the Greeks and Persians, as well as in the Greek revolution of 1821-27.

TENOTOMY (from Gk. *ténōn*, *tenōn*, tendon, from *telvōn*, *teinein*, to stretch, strain + *tomē*, *tomē*, a cutting, from *teueiv*, *temnein*, to cut). The division of a tendon; a surgical procedure which usually has for its object the relief of some variety of deformity by severing a permanently contracted muscle at its tendinous portion. The affections in which tenotomy is most frequently found useful are clubfoot (q.v.), contractions of the extremities following paralysis, deformity from contraction of the palmar fascia, wryneck (q.v.), ankylosis of the joints, and strabismus (q.v.).

TEN PERSECUTIONS OF THE CHRISTIANS. See PERSECUTIONS OF THE CHRISTIANS, THE TEN.

TEN'REC (Malagasy name). An insectivore of the African family Centetidae. Of the seven genera and many species, the best known is the tenrec (also spelled tendrac and tanrec), which is about a foot long, and owes its specific name (*Centetes caudatus*) to having no tail. Its hairs are rather spiny, but actual spines appear only in the young, which have three lines of them along the back, shed at the time of the arrival of the permanent teeth. The tenrecs are nocturnal animals, natives of Madagascar and the Mascarene isles. Three other species exist. They feed mainly on earthworms, æstivate during the hot season, and produce many young, sometimes more than 20. The flesh is edible, and the animal is so useful in the destruction of worms and insects that it has been introduced into Mauritius and Bourbon. See Plate of PORCUPINES AND HEDGEHOGS.

TENSA. See TÆNSA.

TENSE. In grammar (q.v.), the change in the form of a verb which marks the time of the action. See CONJUGATION; VERB; GRAMMAR; PHILLOLOGY, *Syntax*.

TENSKWATAWA, tēn-skwi'tā-wā, or **ELK-SWATAWA**, ēlk-swī'tā-wā (the open door) (c.1775-1834). A Shawnee prophet, younger brother of Tecumseh (q.v.). He attracted no special notice in his tribe until November, 1805, when, at the ancient town of Wapakoneta, in what is now northwestern Ohio, he made public proclamation of a vision during a recent trance, in which he claimed to have been taken up to the spirit world and to have received there a revelation from the God of the Indians, by which they were commanded to return to their primitive condition and customs. In a short time his followers were numbered by the thousands throughout the region of the Ohio valley and the upper lakes. He was believed to be the living incarnation of Manabozho (q.v.), the great culture god of the Algonquian race. In the spring of 1808 he removed, together with his brother, from Greenville, Ohio, to a more central location on the Wabash just below the entrance of the Tippecanoe, the new settlement being familiarly known as Prophet's Town. Here the prophet continued to preach, but the battle of Tippecanoe, Nov. 7, 1811, broke his power and prestige. His followers scattered to their tribes until again summoned to battle by the English. Everywhere denounced as a liar and deceiver, he finally found refuge with the Wyandot. On the outbreak of the War of 1812 he

crossed over into Canada, but returned when peace was declared and rejoined his tribe in Ohio, removing with them to the West in 1827.

TENSON. See TENZON.

TENT. A portable structure of canvas, skin, or other fabrics, designed for shelter. Animal skins and foliage doubtless formed the earliest coverings, for which textile fabrics have been substituted. In the Book of Genesis the patriarchs are represented as dwelling in tents, probably the same as the modern Arab tents, large rude structures, low, but covering a considerable space of ground. The early Greek and Macedonian military tents were small coverings of skin, each tent sheltering two soldiers. The Romans used two sorts of tents, one of canvas, constructed with two upright poles and a ridgepole between, similar to the camping tent of to-day; the other resembling a light hut—a wooden skeleton, covered by bark, hides, thatch, or other material affording warmth or protection. This latter type, it may be presumed, was only employed in the winter or for more permanent camps. Each tent sheltered ten soldiers with their *decanus*. Possibly the tent has reached its highest perfection in Persia, where there are many tribes who dwell in tents. They are nearly hemispherical, over a wooden framework, and covered with felt, with worked hangings covering the entrance. The Chinese lower classes also live much in tents, and while their construction is invariably of matting, they are usually of great size and comfortable in design. Modern military tents are made of cotton canvas, and latterly, since the adoption of the khaki and olive-drab color and its wide use in military uniforms, tents made in this color have been very largely employed both in England and in America as being cooler than those of white canvas. The largest military tents are those used for hospital purposes. They are oblong in shape, with high side walls. The tent most commonly used in military camps is conical or pyramidal, about 12 feet in diameter and 10 feet high, affording sleeping accommodation to about 16 men. In the United States army five kinds of tents are employed: hospital, wall, A, pyramidal, and shelter. Where possible a fly or outer roof is used over the tent proper. The shelter or "dog tent" is a small, easily carried contrivance which affords a degree of shelter for two men. Whether field troops should be supplied with tents or not is a much discussed question. In a thickly settled country they may not be needed. They are needed, however, under conditions requiring the semipermanent occupation of a sparsely settled region (e.g., the Mexican border, 1914-16). The leading consideration is one of transportation, as the tentage of a modern army would add enormously to the transport facilities needed. See ENCAMPMENT.

TENTACULITES, tĕn'tāk-ŭ-lĭ'tēz (Neo-Lat. nom. pl., from *tentaculum*, tentacle, feeler, from Lat. *tentare*, to touch, test, try). An important genus of fossil shells found in Silurian and Devonian rocks and often so abundant that they constitute the greater portion of thin limestone beds. The shells are of delicate, elongate conic form with the outer surface marked by regular transverse striations of either the same or alternate sizes, and also by very delicate longitudinal lines in the hollow between the striations. The species range from $\frac{1}{4}$ to 3 inches in length. See PTEROPODA.

TENT CATERPILLAR. The larvæ of four

species of silk-spinning moths of the genus *Malacosoma* (formerly *Clisiocampa*). The female of the apple-tree tent caterpillar (*Malacosoma americana*), a dull reddish-brown moth with two oblique pale stripes on the fore wings, lays eggs in ringlike masses fastened to small twigs of apple, cherry, thorn, etc. The caterpillars hatch in early spring in the nearest fork of the twigs and spin a web or tent in which they live in company, but which they leave when hungry, to feed upon leaves. The tent is enlarged as the creatures grow. They hibernate in the egg stage. The eggs are easily seen in the winter and may be destroyed and the caterpillars killed just at nightfall within the tents by burning or spraying with kerosene. The so-called forest tent caterpillar, or forest army worm (*Malacosoma disstria*), has similar habits, but the ring of eggs is perfectly cylindrical instead of being rather elliptical as with the former. Both of these species are of Eastern distribution. On the Western coast the larva of *Malacosoma constricta* infests fruit trees in the late summer, and the larva of *Malacosoma californica* is found upon oaks early in the season. An incredible amount of damage is done by these larvæ every year to forest and fruit trees in America.

TENTERDEN, CHARLES ABBOTT, first BARON (1762-1832). An English lawyer and jurist, born at Canterbury. Abbott graduated at Corpus Christi College, Oxford, in 1785, and soon afterward was made a fellow. After being a student of the Inner Temple he was called to the bar in 1796. He joined the Oxford circuit, and rapidly acquired a lucrative practice. He published, in 1802, his treatise on *Merchant Ships and Seamen*, in all respects the best-written book which had till then appeared on one department of English law and still a standard authority. In 1816 he accepted a puisne judgeship in the Court of Common Pleas; and in 1818 he was knighted, and chosen to succeed Lord Ellenborough as Chief Justice of the King's Bench. He was raised to the peerage in 1827 as Baron Tenterden of Hendon.

TEN THOUSAND, RETREAT OF THE. See ANABASIS; XENOPHON.

TEN THOUSAND A YEAR. A novel by Samuel Warren (1841).

TENURE (OF, Fr. *tenure*, from Lat. *tenere*, to hold, retain). The manner in which a person holds or owns real property. The word implies something less than an absolute and unqualified ownership. Before the development of the feudal system, an individual could own a piece of land absolutely, and such allegiance as he might owe to a superior power was a personal matter. However, at the very basis of the feudal system were the ideas of protection and service, of the dominion of the King and the dependence and subordination of the subject. Out of these ideas originated the feudal doctrine that the King should own all the land, and that his subjects were only entitled to hold such portions of it as he might parcel out to them, and on such conditions as he might impose. The Anglo-Saxons held their lands allodially, i.e., by absolute and unqualified ownership; but when the Conqueror assumed the throne he parceled out the country to his men as if it were his private estate and introduced the intricate feudal tenures which had grown up on the Continent. See FEUDALISM.

With respect to their character and dignity, tenures under the feudal system in England may be classified as free and base or nonfree tenures.

The most common of the free tenures was that by knight's service, which involved allegiance, military service, and other duties to the King or overlord. This tenure was created by a solemn ceremony, in which the prospective tenant was said to pay homage to his lord, who thereby became bound to protect him in exchange for his promises of service and fealty. The chief service was performed by actual military duty when necessary, although at a later period a practice of making payments or sending substitutes, instead of the personal service, was sanctioned. Other heavy burdens incident to this tenure were known as reliefs, aids, wardships, and marriage (q.v.), which yielded a large revenue to the great men of the realm.

Less common, but of greater dignity, was the tenure by grand serjeanty, which involved some personal service to the King, usually something other than military duty, as to be his cupbearer, chief justice, standard bearer, etc. Petty serjeanty did not usually involve personal service, but some tribute, such as rendering to the King annually a weapon or a pair of spurs. See **GRAND SERJEANTY**.

Lands were frequently conveyed to the clergy on condition that they sing masses for the souls of the poor or distribute alms at certain intervals. This was known as tenure by frankalmoin or free alms. In early times such land also remained subject to the burdens of feudal tenure.

As the rigor of the feudal system relaxed tenure by socage became the common and popular manner of holding land. See **SOCAGE**.

Gavelkind, borough English, and burgage tenures were merely forms of socage tenure, changed somewhat by local custom. The Statute of Military Tenures in 1640 converted the military tenures into free and common socage.

During the Norman era there existed in England a large class of people known as villeins, who were practically serfs, and were generally attached to the land. They were given small plots to cultivate and were required to perform the most menial services for the lord at his will. This was known as the tenure of villeinage and was a base or nonfree tenure. It became the custom, however, to note the succession of a son to his father, and the character of services performed by the latter, on the rolls or records of the court baron of the manor. By this custom the services required of villeins in each manor assumed a more certain and definite character, and they were said to hold by virtue of a "copy of the rolls of the court." At a later period the payment of rent in some form was substituted for menial services, and the copyhold tenant, as he came to be called, became a respectable member of the community. Many copyhold tenures still prevail, and the old practice of resorting to the "custom of the manor" to ascertain their character or incidents still obtains.

In the United States most of the lands originally granted by the crown and proprietors of plantations were held in free and common socage, and a modified form of this tenure still obtains in a few States. In most of the States, however, all feudal tenures have been abolished and lands are held allodially, i.e., absolutely and subject only to the right of eminent domain in the State.

TENURE IN CHIVALRY. See **CHIVALRY**, **COURT OF**; **FEUDALISM**; **KNIGHT**; **TENURE**.

TENURE OF OFFICE ACT. A measure growing out of the controversy between Congress and President Johnson and passed over his veto on March 2, 1867, providing that the consent of the Senate should be necessary to the dismissal of any officer appointed by and with the advice and consent of that body. Cabinet officials were also included in this. This was a complete reversal of the policy of the government with regard to removals from office, and the President's disregard of the law in removing Secretary E. M. Stanton (q.v.) was the main cause of his impeachment by the House of Representatives. (See **IMPEACHMENT**; JOHNSON, ANDREW.) With the accession of General Grant to the presidency in 1869 the more objectionable features of the Act were stricken out, and finally, in 1887, the Act as a whole was repealed.

TENU-TERU. See **TERU-TERU**.

TENZON, tén'zon, or **TENSON** (Prov. *tenso*, from Lat. *tensio*, stretching, contention, from *tendere*, to stretch). In Provencal poetry, a debate in verse between two poets, and hence a special metrical form adopted for the purpose. See **PROVENCAL LITERATURE**.

TEOCALLI, tā'ō-kil'yē (Nahuatl, house of the god). The ancient Mexican term for a temple and place of sacrifice and worship. The *teocallis* were commonly low, truncated, four-sided pyramids of earth, stone, or adobe brick, with a small temple on the flat summit. There was also as a rule a sacrificial stone on the summit, where public sacrifices were made. The term has come to be applied more specifically to the *teocalli* of the city of Mexico. This famous structure, completed in 1487, was a double pyramid with one temple to the Aztec god of war, *Huitzilopochtli*, and the other to the god of rain, called *Tlaloc*. The *teocalli* was in the *Teopan* or temple inclosure, a great ceremonial centre which also contained many smaller temples. Human sacrifice reached the most horrible extreme on the sacrificial stones of this *teocalli* that it ever reached anywhere in the world. *The Codex Telleriano-Remensis*, an Aztec document, records that 20,000 captives were sacrificed at the dedication ceremonies of the great *teocalli*.

TEOS (Lat., from Gk. *Téus*). An ancient Ionian city on the west coast of Asia Minor, situate on a peninsula projecting into the Gulf of the Cayster, northwest of Ephesus. Here was a celebrated temple of Dionysus and a theatre, of which remains still exist, while the walls of the modern town of Siglajak contain many interesting inscribed stones from the ancient site. Teos was prosperous till the Persian conquest, when a large part of its inhabitants withdrew to their colony of Abdera (q.v.) in Thrace. It was the birthplace of the lyric poet Anacreon (q.v.). The place regained some importance in Roman times.

TEOSINTE, tē'ō-sin'tē (Mexican name), *Euchlaena mexicana*. A tall, spreading, leafy

annual closely related to maize or Indian corn. It is a native of the warmer parts of Mexico and Central America, from whence it has been introduced as a forage crop. The plant requires a rich, moist soil and a long, hot season. In its native habitat it grows rapidly, often attaining a height of 10 to 15 feet in a few months. The stalks bear tassels of staminate flowers and a number of small, flattened, poorly filled ears, the grain of which seldom matures farther north than lat. 30°. On account of its extensive tillering (30-50 stalks often springing from a single root) and its very leafy habit, teosinte produces as much green fodder upon a given area as any other grass. The stalks are tender, and the whole plant is readily eaten by stock. The plants may be cut several times during the season, but a single cutting just before the advent of autumn frosts is said to yield about as much forage as the more frequent cuttings. Teosinte grows best in the United States in the region of the Gulf coast. In Texas, where it is grown for green forage and hay, it produces three crops a year and matures seed only in the extreme southern part of the State. An analysis of the green fodder shows it to contain: water, 66.77 per cent; ash, 3.97; protein, 2.54; fibre, 12.33; nitrogen-free extract, 13.60; fat, 0.79. Consult C. V. Piper, *Forage Plants and their Culture* (New York, 1914).

TEOTOCHI, ISABELLA. See ALBRIZZI, COUNTESS D'.

TEPARY. See BEAN.

TEPEHUAN, tã'pã-hwãn' (mountaineer, or conqueror). A brave and warlike tribe of Piman stock (q.v.) formerly occupying a considerable territory in the Sierra Madre, south of the Tarumari (q.v.), but now restricted to the mountainous region in the extreme northwestern portion of Durango, with adjoining portions of Chihuahua and Sinaloa, Mexico. In former times they were reputed the bravest people of Mexico, and they are still extremely jealous of their tribal rights. They are an industrious, agricultural people, living in houses of logs or stone set in clay mortar, or frequently utilizing the mountain caves for shelter. They cultivate cotton, which they weave into fabrics of beautiful texture and colors. They are now reduced to a mere remnant.

TEPIC, tã-pëk'. A territory in western Mexico (Map: Mexico, F 6, 7). Area, 11,275 square miles. The surface is low on the coast and mountainous toward the eastern frontier. Agriculture is the chief industry, the principal products being wheat, coffee, tobacco, and sugar. Gold, silver, copper, and lead are found. Pop., 1910, 171,173, mostly semi-independent Indians. Capital, Tepic (q.v.). The Nayarit population long resisted the Spanish sway and were not subdued until 1722, and then only nominally. In 1872 they rebelled against the Mexican government, but were subdued after a bloody struggle. The Territory of Tepic was organized in 1889.

TEPIC. The capital of the Territory of Tepic, Mexico, 28 miles east of the port of San Blas, with which it is connected by a railway (Map: Mexico, F 7). Situated on a plateau 3069 feet above the sea, it commands a fine view of the Pacific; its climate, mild and healthful, attracts many summer residents from San Blas. It has cotton and cigar manufactures. Pop., 1910, 16,778. It was founded in 1531 by Nuño de Guzmán.

TEPIDARIUM. See BATH.

TEPLITZ, or **TÖPLITZ**, tẽp'lits. A town of Bohemia, Austria, 46 miles northwest of Prague, in the valley of the Biela, between the Erzgebirge and the Mittelgebirge ranges (Map: Austria, C 1). It is a favorite watering place, famous for its hot springs, which range in temperature from 97° F. to 120° F.; they are almost free from mineral properties and are visited as an aftercure by patients from Marienbad, Carlsbad, etc. The most important building is the castle of Prince Clary, which, with its surrounding park and gardens, constitutes the chief resort of the town. Tepplitz has important manufactures of machinery, hardware, buttons, cotton and india-rubber goods, chemicals, glass, pottery, and sugar. The springs have been celebrated since the eighth century. The town is known for the treaty of alliance signed here Sept. 9, 1813, by the monarchs of Russia, Prussia, and Austria against Napoleon. Pop., 1900, 24,117; 1910, 26,775.

TERAI. See TARAI.

TER'AKTOG'ENOS KUR'ZII. A large tree, 40 to 60 feet in height, belonging to the family Bixacæ. It is most abundant in Chitlagong and Burma, the seeds furnishing the true chaulmoogra oil, instead of *Gynocardia odorata*, as formerly reported. The seeds are marketed largely in Calcutta and are found in two forms, mature brown seeds rich in oil and immature seeds black in color, poor in oil. Chaulmoogra oil has long been used in India for cutaneous diseases, and it has attained some repute in the treatment of rheumatism, scrofula, and leprosy (qq.v.).

TERAMO, tã'rã-mô. The capital of the Province of Teramo, Italy, 32 miles northwest of Chieti, at the confluence of the Tordino and Vazzola rivers (Map: Italy, D 3). It lies amid attractive mountain scenery, and has interesting Roman remains. The fourteenth-century cathedral was restored in 1898. The Church of Sant' Agostino is a handsome Gothic structure. Pottery, leather, fine furniture, straw hats, and cream of tartar are manufactured. The Gran Sasso d'Italia is often ascended from here. Pop. (commune), 1901, 24,563; 1911, 24,312.

TER'APHIM. A Hebrew word, plural in form but of obscure origin, designating a certain kind of images used for oracular purposes. The teraphim appear to have been of various shapes, in some instances small enough to be hidden in the camel litter—as in the story of Rachel's theft of the teraphim belonging to her father, Laban (Gen. xxxi. 19, 34), while in others they had a human form and were large enough to be used as a substitute for a man, as in the story of Michal's successful deception of her father, Saul, by placing a teraph in David's bed (1 Sam. xix. 13-16). The reverence paid to the teraphim as household deities lent a persistence to the practices connected with them that survived even Josiah's reform (2 Kings xxiii. 24), and we find teraphim in vogue even in the Greek period (Zech. x. 2). Connected in some way with ancestor worship, it is not unlikely that there is some relationship between teraphim and Rephaim (q.v.)—the shades of the dead. Consult Schwally, *Das Leben nach dem Tode* (Giessen, 1892); I. Ben-zinger, *Hebräische Archäologie* (2d ed., Tübingen, 1907).

TER'ATOL'OGY. The study of the abnormal

structures of plants, arising from any cause. Conspicuous among causes are parasitic fungi and insects, resulting in hypertrophies, some of which are known as galls. Many unusual structures arise in plants, however, which cannot be referred to such obvious causes. See MALFORMATION; MONSTROSITY.

TERBIUM, tēr'bi-ūm (Neo-Lat., from *Ytterby*, in Sweden). A very rare metallic element discovered by Mosander in 1843, but first isolated from other metals, in the form of its pure oxide, by Urbain in 1904. It was originally found with erbia, yttria, and other rare earths, in the mineral gadolinite from Ytterby, Sweden. The chemical symbol of terbium is Tb; its atomic weight is 159.2. It forms a white oxide of the formula Tb_2O_3 and a dark-brown peroxide of the formula Tb_2O_4 .

TERBORCH, tēr'bōrk (TER BORCH, TERBURG), GERARD (1617-81). One of the most eminent genre and portrait painters of the Dutch school. Born at Zwolle, he was first instructed by his father, an artist of some ability. In 1632 he went to Amsterdam, and in 1634 he was at Haarlem, the chief pupil of Pieter Molyn. The influence of the grand master of Haarlem, Frans Hals, is noticeable in his first dated picture, "Consultation" (1635, Berlin Museum). To the same period may be assigned the "Knife-Grinder's Family" (ib.), and "Boy with a Dog" (Pinakothek, Munich). In 1635 he went to England, where he painted several portraits of William III; in 1649 he was at Rome, and in 1645 again at Amsterdam. Thence in 1646 he went to Münster, Westphalia, where he painted his most celebrated work, the "Peace Congress of Münster" (1648, National Gallery, London), containing 60 likenesses, a perfect specimen of miniature portrait painting, and one of the most imposing historical works in Dutch art. Accompanying Count Pefferanda, one of the Spanish envoys, to Madrid, he achieved high success, and is credibly reported to have portrayed Philip IV. By 1650 he was back in Holland. In 1654 he settled at Deventer, where he resided till his death. Terborch's work falls into two stylistic periods—an early, resembling that of the earlier Amsterdam genre painters, Codde, Duck, and Duyster; and a later, beginning with 1651, strongly reminiscent of Metzu. A comparison of his paintings before and after the Spanish visit does not confirm the supposed influence of Velazquez. From 1651 till 1680 he painted a series of genre and small portrait subjects, unexcelled in Dutch or any other art. Among the best known are: "The Reading Lesson," "An Offer of Money," and "The Concert" (all in the Louvre); "The Despatch" (The Hague); "Paternal Admonition" (c.1655, Amsterdam and Berlin); "Trumpeter Delivering Love-Letter" (Munich); "Officer Writing Letter" and "Officer Reading Letter" (both in Dresden); and the "Guitar Lesson" (National Gallery, London). From 1669 his style became more delicate and simple, as may be seen in such works as: "The Music Lesson" (1660, Louvre); "Lute Player" (Antwerp, Cassel, and Dresden); "The Concert" (Berlin); "Lady Washing Her Hands" (Dresden); "Paring an Apple" (Vienna); and "The Letter" (Buckingham Palace, London), one of his most distinguished delineations. A striking example of fine modeling and masterly textures is "The Smoker," in the Berlin Museum. His "Meeting of the Town Council"

(1667, Town Hall, Deventer) ranks next to his Münster picture as regards the number of figures. He painted also a large number of excellent single portraits, about 180 of which survive, masterly alike in characterization and in execution. Perhaps the most celebrated of these is the portrait of himself at The Hague. There are four excellent examples in the Berlin Museum, and one in the Metropolitan Museum, New York, which possesses also "A Lady Playing the Theorbo" (Altman collection) and "The Toilet," a wonderful arrangement in rose, loaned by J. P. Morgan. Terborch is one of the most perfect technicians in Dutch or any art. He excels in all pictorial qualities, line, composition, color, treatment of light, and atmosphere. His exquisitely finished detail never distracts from the general effect, and his textures are especially fine. Consult: Michel, *Terburg et sa famille* (Paris, 1888); Rosenberg, *Terborch and Jan Steen* (Leipzig, 1897); *Masters in Art*, vol. ii (Boston, 1901); Wilhelm Bode, *Great Masters of Dutch and Flemish Painting* (New York, 1909); Hofstede de Groot, *A Catalogue of Dutch Painting* (London, 1913).

TERCE. See BREVIARY.

TERCEIRA, tēr-sā'ē-rā. The second largest island of the Azores (q.v.) (Map: Portugal, B 4). Area, 223 square miles. It is of volcanic origin. The coast is lined with precipitous cliffs of lava and the diversified surface attains a maximum altitude of 3500 feet in Caldeira de Santa Barbara. Wine, lumber, and archil are produced and largely exported. Angra do Heroismo (q.v.), the chief town of the island, is also the seat of government for the entire group. The population of Terceira in 1900 was 48,920.

TER/CEL. See PEREGRINE FALCON.

TER-CENTENNIAL EXPOSITION AT JAMESTOWN. A military, naval, marine, and historic exhibition in commemoration of the first permanent settlement of English-speaking people in America, on Hampton Roads, near Norfolk, Virginia, held from April 26 to Nov. 30, 1907. A site at Sewall's Point covering 400 acres of land space, with three miles of water front, was selected on which buildings were erected chiefly in the Colonial style of architecture for the purpose of displaying exhibits pertaining to army and navy, art, food products, historic art, machinery and transportation, manufactures and liberal arts, medicine, sanitation and hygiene, mines and metallurgy, mothers and children, the negro, United States government, and Virginia manufactures. State buildings, as well as an Auditorium and Convention Hall, and an Arts and Crafts Village, contained Colonial articles in metals, woods, and fabrics. The history of the United States from the settlement of Jamestown was portrayed. The government appropriated \$1,575,000 in aid of the exhibition, and of this amount \$50,000 was for a permanent monument at Jamestown.

TEREBRATULA (Neo-Lat., nom. pl., diminutive of Lat. *terebratus*, p.p. of *terebrare*, to bore, pierce). A name properly applicable to certain species of the Mesozoic and Tertiary fossil shells which are closely allied to *Terebratula phillipsi* of the Middle Jurassic. This group appeared in the Devonian, and, with a great expansion during the Mesozoic, it continues to the present day. As a rule the shells have a pentagonal or oval outline, with both valves convex, the ventral beak prominent and arching over the

dorsal beak and perforated by an unusually large foramen. The earlier species are smooth-surfaced shells, while those of the Mesozoic are sometimes striated and in a few instances plicated.

TEREDO. A small Lamellibranch mollusk of the genus *Teredo*. The common shipworm (*Teredo navalis*) is found widely distributed throughout the oceans, where it inhabits long and complicated borings which it makes in submerged piles of wharfs, floating logs, or the exposed bottoms of wooden ships. Wood which is attacked by teredos is soon rendered useless, and much damage is done by them annually, especially in tropical waters. The only absolute protection against the attack of the teredo is mechanical, such as sheathing the wood with copper, or with broad-headed short iron nails. Impregnating the wood with preservatives (creosote, etc.) has been tried with widely varying results. See SHIPWORM.

TEREK, tēr'ek. A river of southeast Russia, one of the chief streams flowing from the Caucasus. It rises in a glacier near the summit of Mount Kazbec at an altitude of nearly 14,000 feet, and descends the north slope of the Caucasus in a tumultuous course through deep and narrow gorges. It then turns east, and after a flow of 400 miles, enters the Caspian Sea through a large delta. The river is navigable 254 miles for small vessels.

TEREK. A province in the eastern part of north Caucasia (see CAUCASUS) bordering on the Caspian Sea. Area, about 28,153 square miles (Map: Russia, F 6). It is bounded on the south by the Caucasus Mountains, many of whose highest peaks it contains. The interior is occupied to a large extent by the offshoots of the main chain and slopes towards the Terek and the coast, which is low and marshy. The region is watered by the Terek and its tributaries, and abounds in mountain lakes. In the lowlands along the coast and the Terek the climate is very unhealthy. Hence most of the settlements are found in the mountainous districts. Terek produces few minerals aside from petroleum, which is obtained in increasing quantities in the Grozny oil field, which in 1913 yielded 3275 tons per day. At Pyatigorsk (q.v.) are the best known of the mineral springs. Agriculture gives occupation to about 80 per cent of the inhabitants, but only a small portion of the cultivated land is utilized. The chief products are wheat, corn, rye, and hemp. The output of wine is extensive. The natives keep large numbers of horses and sheep. Pop., 1912, 1,231,600. Capital, Vladikavkaz (q.v.).

TERENCE (PUBLIUS TERENTIUS AFER) (c.190-c.159 B.C.). A Roman writer of comedies. He was born at Carthage, but was of African (not Phœnician) origin. He was brought to Rome as the slave of the Roman Senator Terentius Lucanus, who gave him a good education, and finally manumitted him. His first play was the *Andria*, staged in 166 B.C. Its success introduced its author to the most refined society of Rome, where his engaging address and accomplishments made him a particular favorite. His chief patrons were Lælius (q.v.) and the younger Scipio (q.v.). After living with them in great intimacy for some years he went to Greece, where he spent a year in studying the Greek comedies of Menander, Diphilus, Apollodorus, and others, and adapting them in Latin for the Roman stage. He never returned.

He is supposed to have died by drowning. Six comedies are extant under the name of Terentius: *Andria*, *Hecyra*, *Heautontimoroumenos*, *Eunuchus*, *Phormio*, and *Adelphi*. Terence preserved a sort of charmed life throughout the dark ages when classical literature was almost forgotten, and on the revival of letters was studied as a model by the most accomplished playwrights, e.g., by Molière (q.v.). For his influence on English comedy see the introduction to the edition of the *Heautontimoroumenos*, by F. G. Ballentine (Boston, 1910). His language is pure, almost immaculate. Though he is inferior to Plautus in comic power, he is more than his match in consistency of plot and character drawing, in tenderness, in wit, and in metrical skill. The best text editions are those of Wagner (Cambridge, 1869), Umpfenbach (Berlin, 1870), Dziatzko (Leipzig, 1884), and Fleckeisen (ib., 1901). Good annotated editions of individual plays are those of the *Andria* by H. R. Fairclough (Boston, 1901); *Adelphi*, by K. Dziatzko (2d ed., rev. by R. Kauer, Leipzig, 1903); *Phormio*, by Dziatzko (4th ed., rev. ed., by E. Hauler, Leipzig, 1913); *Eunuchus*, by P. Fabia (Paris, 1895). A convenient annotated edition of all six plays is that by S. G. Ashmore (Oxford, 1908). The ancient Scholia to Terence by Donatus (q.v.) were edited by P. Wessner, 3 vols. (Leipzig, 1902-05). There are English translations by Colman (London, 1841); Riley (New York, 1859); Sargeant (London, 1912); and of the *Phormio* by M. H. Morgan (Cambridge, Mass., 1894). Consult W. Y. Sellar, *The Roman Poets of the Republic* (3d ed., Oxford, 1889); W. S. Teuffel, *History of Roman Literature* (Eng. trans., from 5th Ger. ed. by G. C. W. Warr, London, 1891); Martin Schanz, *Geschichte der römischen Literatur*, vol. i, part i (3d ed., Munich, 1907); J. W. Duff, *A Literary History of Rome* (New York, 1909); M. S. Dimsdale, *A History of Latin Literature* (New York, 1915).

TERENTIANUS MAURUS, tēr'ēn'shī-ā'nūs mā'rūs. A Roman poet, a native of Mauretania (q.v.), who flourished at the end of the second century A.D. We have three poems by him, in hexameters, on prosody and the various metres, entitled *De Litteris*, *De Syllabis*, and *De Metris*. This work was much used by later writers. It has been edited by Santen and Van Lennep (with commentary, Utrecht, 1825), Lachmann (Berlin, 1836), Gaisford (Oxford, 1855), and, best of all, by H. Keil, in his *Grammatici Latini*, vol. vi (Leipzig, 1871-74). Consult Martin Schanz, *Geschichte der römischen Literatur*, vol. iii (2d ed., Munich, 1905); W. S. Teuffel, *Geschichte der römischen Literatur*, vol. iii (6th ed., Leipzig, 1913).

TERESA, SAINT (1515-82). A famous Carmelite nun and mystical writer. She was born at Avila, in Old Castile. In her eighteenth year she entered a convent of the Carmelite Order in her native city, making her solemn vow on Nov. 3, 1534. In this convent she continued to reside for nearly 30 years. After a time her religious exercises reached a most extraordinary degree of asceticism. She began her work of reforming the Carmelite Order in the Convent of Avila, but afterward obtained permission from the Holy See, under the direction of Peter of Alcántara, to remove with her little community to St. Joseph's, a small and very humble convent in the same city, where she established in its full rigor the ancient

Carmelite rule, with some additional observances. This new convent was established in 1562. The general of the Carmelite Order, J. B. Rossi, was so struck with the condition of the convent that he urged upon her the duty of extending throughout the Order the reforms thus successfully initiated. Teresa entered upon the work with great energy, and succeeded in carrying out her reforms. (See CARMELITES.) She died at Alba, Oct. 4, 1582, and was canonized by Gregory XV in 1622, her feast being fixed on October 15. The third centenary of her death was celebrated with great splendor in 1882. Her works consist, besides her famous letters, mainly of ascetical and mystical treatises. Complete editions in Spanish were published at Madrid in 1877 and 1881; an excellent French edition is that of Bouix (Paris, 1859). English translations of her *Life* are edited by David Lewis (4th ed., New York, 1911) and by J. J. Burke (ib., 1911). Consult also: H. J. Coleridge, *Life and Letters of Saint Teresa* (3 vols., London, 1881-96); Alexander Whyte, *Santa Teresa* (New York, 1898); H. H. Colvill, *Saint Teresa of Spain* (ib., 1909); Alice, Lady Lovat, *Life of Saint Teresa* (St. Louis, 1912).

TEREUS, tĕr'ĕ-ŭs. See PHILOMELA.

TERGOES, tĕr'gōŭs'. A seaport of the Netherlands. See GOES.

TERGOVISTE, tĕr'gō-vish'tĕ, or TARGUVISHTĒA. The capital city of the District of Dimbovitza, Rumania, 50 miles northwest of Bucharest, on the right bank of the Jalomitza (Map: Balkan Peninsula, E 2). As the former capital of Wallachia it had a population of 60,000 in the sixteenth century. The town is now an important strategic point. Pop., 1900, 9393.

TERHUNE, tĕr-hūn', MARY VIRGINIA (HAWES) (1831-1922). An American novelist and journalist, born in Richmond, Va., of New England ancestry. She married in 1856 Rev. Edward P. Terhune of Brooklyn, was editorially connected with *Babyhood*, *Wide Awake*, *Saint Nicholas*, and *The Home-Maker*, and published under the name of Marion Harland many domestic manuals, social essays, sketches of travel, novels, and short stories, among which may be noted: *Alone, A Tale of Southern Life and Manners* (1854); *Husks* (1863); *Sunnybank* (1866); *At Last* (1870); *Common Sense in the Household* (1872), one of her best-known books; *Judith* (1883); *A Gallant Fight* (1888); *Dr. Dale* (1900), with Albert Payson Terhune; *When Grandmama was Fourteen* (1905); *Distractions of Martha* (1906); *Where Ghosts Walk* (1st series, 1908; 2d series, 1910); *Marion Harland's Autobiography* (1910); *Looking Westward* (1914); *The Long Lane* (1915).

TERLIZZI, tĕr-lit'sĕ. A town in the Province of Bari delle Puglie, Italy, 20 miles west by north of Bari and about 7 miles from the Adriatic. It has an ancient castle. It is active commercially. Wine and almonds are leading products. Pop. (commune), 1901, 23,232; 1911, 22,874.

TERM (OF. *terme*, from Lat. *terminus*, OLat. *termo*, *termen*, boundary, limit). In the law of real property, the time during which a tenant is entitled to enjoy an estate, according to his lease. The word is also sometimes employed to denote the estate or interest of the tenant. See LANDLORD AND TENANT.

TERM. See LOGIC.

TERM, CONNOTATION OF A. See CONNOTATION.

TERM, OF COURT. In practice the word "term"

denotes a period in which a court holds a session. Under the common-law system in England the judicial year was divided into four terms, the names of which indicated the time of the year in which they were held, viz.: Hilary term, Easter term, Trinity term, and Michaelmas term. These terms were abolished by the Judicature Acts. In the United States the terms of court are arranged with reference to the number of judges available and the probable volume of judicial business to be disposed of. It is usual, however, to have a vacation of several months during the summer. The phrase is also used in the United States to describe the parts of the court, such as trial and special terms. The tendency of the modern system of courts is to divide the parts or terms according to the nature of the litigation.

TERMINAL, RAILWAY. See RAILWAYS, Yards and Terminals.

TERMINALIA. See TERMINUS.

TERMINAL SUGGESTION. See HYPNOTISM.

TERMINER. See OYER AND TERMINER.

TERMINI IMERESE, tĕr'mĕ-nĕ ĕ'mā-rā'zā. A city on the north coast of Sicily in the Province of Palermo, on the San Leonardo, 21 miles east-southeast of Palermo (Map: Italy, D 6). Though of archaeological interest the modern town is flourishing but dull. It contains a collection of pictures and a few antiques, besides a library and school of seamanship. There are extensive tunny and sardine fisheries. The exports include Sicilian macaroni (for which the town is famous), besides wine, olive oil, fruits, grain, and rice. The warm saline springs are much frequented for bathing. Pop. (commune), 1901, 18,650; 1911, 20,319. Termini Imerese, the Roman *Termae Himerenses*, was founded by the Carthaginians in 407 B.C., after the destruction of the ancient Ilimera (q.v.), the ruins of which are still to be seen. It had become largely Hellenized when it was captured by the Romans in the First Punic War.

TERMINOLOGY, MEDICAL. See NOSOLOGY.

TERM INSURANCE. See LIFE INSURANCE.

TERMINUS (Lat., boundary, limit). A Roman divinity presiding over public and private boundaries. His only sanctuary was in the Temple of Jupiter, on the Capitol, where he was honored in the form of a boundary stone, above which was an opening in the roof, that his rites might be performed, as ritual required, in the open air. Terminus has been regarded by some as an early god who later yielded to Jupiter, by others as a later schematizing offshoot from the original conception of Jupiter as the guardian of all boundaries. The Terminalia seems to have been simply a festival of neighbors at their common boundary lines. We hear of annual sacrifices also at the frontier (real or assumed), but dedications to Terminus are unknown before the days of the Empire. "Termini" or "terminal figures" are names applied to boundary marks consisting of a stile or upright stone carved at the top into the likeness of the head of the god. Such stones were imitated in the Renaissance in Italy as decorations for the corners of parterres or other garden divisions. Consult W. W. Fowler, *Roman Festivals* (London, 1899); Georg Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

TERMITE (from Lat. *termes*, *tarmes*, wood-worm; connected with *terere*, Gk. *relpeiv*, *teirein*, to rub). Any one of the insects of the order

Isoptera, comprising those forms known as white ants. They are not at all related to the true ants, but their general appearance and the fact that they live in societies have given them the popular name. For an account of the community life and of the different castes of the termites, see INSECT, *Social Insects*.

The order Isoptera, which is most numerously represented in the tropics, includes only the single family Termitidae, whence their common name "termite." They undergo practically no transformation. The young when it hatches from the egg is an active, crawling creature

AMERICAN NORTHERN WHITE ANT (*Termes flavipes*).
1, adult male; 2, worker; 3, soldier; 4, supplementary queen. (After Mariatti.)

with six legs, much resembling the adult except in size. All species are social, and the communities consist of both wingless and winged individuals. The males and females which are winged have very long membranous longitudinally veined wings, in repose lying flat along the back, extending far beyond the abdominal tip. The hind wings are of nearly the same shape and size as the front wings, and across the base of each wing is a line of weakness indicating where the wing breaks after the nuptial flight. The nests, often built of earth, are hard and persistent, and sometimes more than 12 feet high. These ant hills are divided into chambers and galleries, and there are generally two or three roofs within the dome-shaped interior. The thick walls are perforated by passages leading to the nurseries and storehouses. Termites sometimes attack the woodwork of houses and soon reduce the thickest timbers to a mere shell. Those species which live in trees sometimes construct nests of great size, like sugar casks, of particles of gnawed wood cemented together and very strongly attached to the branches.

In the United States there are comparatively few species, and only one (*Termes flavipes*) which has a northward range. This is the common white ant found frequently living in the joists and other large timbers of houses. In these they make innumerable tunnels, running usually with the grain of the wood, so that, although a great deal of the substance of the wood is devoured, the main longitudinal fibres support the building structure for a long time. In fact, their presence in many houses would not be noticed except for the spring flight of the

winged males and females. This species is probably native to North America, although it was accidentally introduced into Europe. A species known as *Termes tubiformans* occurs in Texas, and makes tubes around the grass stems and stems of other plants, while their nests are placed deep in the ground.

The origin of a new termite colony occurs after the nuptial flight, when the female's (queen's) wings break off; her body swells with eggs, grows enormously, and egg laying commences. Unlike the true ants or any of the other social Hymenoptera, the young require very little care from the workers. Just as with the true ants and other social insects, there are many termitophilous or guest insects to be found in the nests of termites. The damage done by termites in tropical regions is very great. In Central America it is almost impossible to erect wooden telegraph poles which will last for any length of time, as they are tunneled by these insects and fall very soon. Consult David Sharp, "Insects," in *Cambridge Natural History*, vol. v (London, 1895), and L. O. Howard, *The Insect Book* (new ed., New York, 1914).

TERMONDE, tēr'mōnd'. See DENDERMONDE.

TERN (Dan. *terne*, Icel. *perna*, tern), or SEA SWALLOW. One of a group, the Sterninae, of small gulls (q.v.), found in most parts of the world, and essentially gulls in habits and appearance. About 75 species are known, varying in size from the Caspian tern (*Sterna tschegrava* or *caspia*), which is nearly 2 feet long and 4½ feet across the wings, down to the dainty least tern (*Sterna antillarum*), which is only 9 inches long. The typical color of the terns is blue-gray above, white beneath, and black on the crown, but one or two species are pure white, some are black and white, some sooty brown, and some almost wholly black. The common tern is *Sterna hirundo*, abundant on the coasts of the whole Northern Hemisphere and of Africa. It breeds locally on the coast and in the Mississippi Valley from the Gulf States to Greenland, but, owing to incessant persecution, it selects only unoccupied sandy islets for its breeding places, and from New Jersey to Maine its only resorts now are Gull Island, N. Y., and Penikese, Weepeeket, and Muskeget Islands, Mass. The Arctic tern (*Sterna paradisæa*) is very similar. Its egg is shown on Colored Plate, EGGS OF AMERICAN GAME AND WATER BIRDS, and is typical of tern's eggs generally. The gull-billed tern (*Gelochelidon nilotica*) of the Southern States, a cosmopolitan species; the roseate tern (*Sterna dougalli*) of the Atlantic coast; the sooty tern, or egg bird, of the West Indies (*Sterna fuliginosa* or *fuscata*), also southern; and the elegant tern (*Sterna elegans*) of the Pacific coast from California southward, are the most interesting among the 15 or 16 other North American species.

TERNATE, tēr-nā'tā. A small but important island of the Moluccas, situated off the west coast of the island of Gilolo (Map: East India Islands, G 5). Area, about 25 square miles. It consists of an active volcanic peak, rising 5600 feet above the sea. The chief town, Ternate, has a population of about 9000 and a good harbor. It is the seat of the Sultan of Ternate, who has large dominions in Celebes, and is the capital of the Dutch Residency of Ternate, which embraces the northern Moluccas and parts of New Guinea and Celebes. Its climate

is peculiar, owing to the difficulty of determining whether its one season is dry or wet. See *MOLUCCAS*.

TERNAUX-COMPANS, tār'nō' kōn'pān', HENRI (1807-64). A French historian, bibliographer, and diplomatist, born in Paris. He is best known for his remarkable collection of books and manuscripts on the early history of America, collected during diplomatic employment in Spain, Portugal, and Brazil. He was also once a member of the French Chamber of Deputies. He published a catalogue of Americana before 1700, *Bibliothèque américaine* (1836); also translations of documents in his collection in 20 volumes, *Voyages, relations et mémoires originaux pour servir à l'histoire de la découverte de l'Amérique* (2 series, 1836-40); and other works of less significance.

TERNAY, tār'nā', CHARLES LOUIS D'ARSAE DE (1722-80). A French naval officer, born at Ternay, in Normandy. He entered the navy in 1738 and fought at Louisbourg in the French and Indian War. In 1762, in command of a squadron, he attacked Newfoundland, and captured St. John's and several British vessels. He was Governor of the island of Bourbon (1772-79). In 1780 he commanded the French fleet that brought over to America Count Rochambeau and his forces. He died at Newport soon after his arrival.

TERNI, tēr'nē. A city in the Province of Perugia, Italy, 59 miles south by east of the city of Perugia, on the Nera River, near its confluence with the Velino (Map: Italy, D 3). The many Roman remains, including an amphitheatre, sculptures, baths, inscriptions, etc., are interesting. The city has a large government arsenal and extensive iron and steel interests. Woolen goods, brick, olive oil, and wine are also manufactured. Near by are the famous falls of Terni, in the Velino River—the Cascade delle Marmore—with a total descent of 650 feet, supplying power to the city. Pop. (commune), 1901, 30,641; 1911, 32,754. Terni, the ancient Interamna, was of considerable importance under the Romans.

TERNINA, tēr-nē'nā, MILKA (1864-). An Austrian dramatic soprano, born at Vezisce (Croatia). At 12 she began her vocal studies with Madame Winterfeld, and in 1880 she entered the Vienna Conservatory, where for two years she studied with Günsbacher. While still a student she made her début at Agram as Amelia in Verdi's *Ballo in Maschera*. From 1883 she sang successfully at Leipzig, Graz, and Bremen. In 1890-99 she was a member of the Court Opera at Munich, where she soon was acknowledged one of the foremost interpreters of Wagner's heroines. In 1896 she made her American début with Mr. Damrosch's company, and instantly won marked favor. In 1899-1904 she was one of the principal attractions of the Metropolitan Opera House, where she sang Kundry in the first American performances of *Parsifal*. After 1899 she appeared frequently in Bayreuth. Owing to ill health her appearances after 1906 were rare. Although in the front rank of the great Wagner interpreters, she won scarcely less fame as a lieder singer, especially in the songs of Brahms.

TERNSTRÖMIA/CEÆ (Neo-Lat. nom. pl., from Ternströmia, named in honor of the Swedish naturalist Ternström). A family of dicotyledonous trees and shrubs, including about 16 genera and 160 species, natives of warm and

tropical regions. The best-known representatives are the tea (q.v.) plant and camellia (q.v.). The family is represented in North America by *Stewartia* and *Gordonia* (q.v.), the latter being called loblolly bay or tan bay. Another name of the family is Theaceæ (tea family), which is coming into common use.

TERPANDER (Lat., from Gk. Τέρπανδρος, *Terpandros*). A Greek musician who lived in the seventh century B.C. He was born at Antissa, in the island of Lesbos, went to Sparta, and in 676 was crowned victor in the first musical contest at the feast of Apollo Carneius. He established there the first musical school in Greece and is credited with the enlargement of the compass of the lyre to an octave. He was the first to set poetry regularly to music.

TERPENES. Unsaturated compounds of the composition (C_5H_8) yielded by plants or built up by organic synthesis. They are divided into the following groups: *Hemiterpene*, C_5H_8 , consisting of isoprene chains from which the well-known geranial or citral is a derivative. *Terpenes*, $C_{10}H_{16}$, ring forms, familiar as pinene and limonene. *Sesquiterpene*, $C_{15}H_{24}$, contained in oils of clove, cedar, hops, patchouli, etc. *Polyterpenes*, $C_{30}H_{48}$, principally occurring as caoutchouc or rubber. *Isoprene* or methyl butadiene, C_5H_8 , is chiefly important as the starting point for the synthesis of rubber. By heating two or more equivalents of the compound in the presence of weak acetic acid from 100-200° C. (212-392° F.) rubber is formed. According to Pickles, *Journal Chemical Society* (London, 1910), rubber consists of a long chain made up of isoprene links— $CH_2 \cdot CCH_3 \cdot CH \cdot CH_2 \cdot CCH_3 \cdot CH \cdot CH_2$ —etc. See RUBBER; SYNTHETIC RUBBER.

The terpene, $C_{10}H_{16}$, group contains two important hydroaromatic forms, limonene and pinene. The former is monocyclic and absorbs two molecules of halogen acid or four atoms of halogen, the latter is bicyclic and absorbs one molecule of halogen acid or two atoms of halogen. Pinene occurs in American oil of turpentine as the dextrorotary form (australene) and in German or French turpentine as the levorotary type (terebenthene). Both occur in various essential oils—rosemary, sage, juniper, etc. Pinene combines with dry hydrogen chloride to form an addition product known as artificial camphor. On heating the hydrochloride with alcoholic potash, camphene, an isomer of pinene, is formed. The same result is obtained by the action of strong sulphuric acid on turpentine. By oxidation with chromic acid camphene yields camphor, $C_{15}H_{10}O$.

Limonene occurs in two optically active forms: dextralimonene in orange, lemon, and caraway oils; levulimonene in firwood oil. Both form liquid hydrochlorides with two molecules of HCl, and take four atoms of bromine. By mixing equal quantities of the dextro and levo forms a racemic type is obtained; this is called dipentene and occurs in Russian and Swedish turpentine. Carophyllene of cloves, humulene of hops, cedrene of cedar oil, and conimene of incense resin are among the sesquiterpenes isolated and studied. See HYDROCARBONS.

TERPSICHORE, tērp-sīk'ō-rē (Lat., from Gk. Τερψιχόρη, fem. of τερψιχόρος, *terpsichoros*, delighting in the dance, from *terpsis*, enjoyment + *choros*, *choros*, dance). In Greek mythology, one of the nine Muses (q.v.). She presided over the choral dance. In the later assignment of functions to the Muses, she was

regarded as the Muse of the lesser lyric poetry, and was distinguished by the lyre.

TERQUEM, tär'kän', OLRY (1782-1862). A French geometer, born at Metz of Jewish parents. In 1804 he was called to Mainz as professor of mathematics in the Lyceum, and afterward to a similar position in the school of artillery. Returning to Paris in 1814, he was appointed librarian in the artillery depot at Saint-Thomas-d'Aquin. Terquem was a distinguished geometer and is well known for his *Nouvelles annales de mathématiques*, a publication which he founded together with Gerono in 1842, and which is still continued. He also wrote a work entitled *Bulletin de bibliographie, d'histoire et de biographie mathématiques* (7 vols., 1855-61).

TERRACE (Fr. *terrasse*, from It. *terraccia*, *terrazzo*, terrace, from *terra*, from Lat. *terra*, earth). 1. In geology, a stretch of comparatively level land along the shore of a lake or the ocean or bordering a river course and elevated some distance above water level. Terraces frequently occur in series, one rising above the other as the distance from the shore increases. River terraces owe their origin to the cutting down of flood plains; as a river channel widens and deepens the flood plain is gradually cut away until only the edges near valley walls remain. This process may be repeated several times, giving rise to a succession of terraces—the oldest having the highest elevation and being farthest removed from the river. The drift terraces so common in the northern States are remnants of flood plains that were formed when the overloaded streams of the Glacial period filled their preglacial valleys. Lake terraces mark former shore lines and are evidence of a shrinkage in the volume of the lakes. They are well marked around most of the Great Lakes, on the shores of Lake Champlain, and lakes of the Great Basin. Their abundance has suggested the term "Terrace epoch" to designate the geological period during which they were produced. See BEACHES, RAISED; LAKE; LAKE AGASSIZ; RIVER; ETC.

2. In architecture and gardening, a terrace is a level space or platform of earth or masonry, raised or embanked above the surrounding grade, or partly cut out and partly embanked on a slope to provide a horizontal surface for planting, for promenading, or for decorative buildings. In formal gardening the terrace is faced and held up by a vertical retaining wall, often of decorative design, crowned by a balustrade and provided with stairways from the next level below. English country houses are usually set on a low broad terrace projecting in front or both in front and rear. The terraces of Italian gardens are adorned with flowers, trees, grottoes, fountains, and statuary, and constitute their most distinctive feature.

TERRACINA, tär'rä-ché'nä. A city in the Province of Rome, Italy, 76 miles southeast of the city of Rome, on the Tyrrhenian Sea, and at the south end of the Pontine Marshes (Map: Italy, D 4). The ancient city occupied a commanding position on the crest of a hill overlooking the modern site. This section affords a magnificent view and has interesting remains of the Roman period, notably those of the imposing Temple of Venus, which until 1894 were supposed to belong to a palace of Theodoric the Ostrogoth, and an amphitheatre. The Cathedral SS. Pietro and Cesareo in the modern city, oc-

cupping the site of another Roman temple, is of much architectural beauty. Pop. (commune), 1901, 11,310; 1911, 11,121 (town, 7579). Terracina, the Volscian Anxur and the Latin Taracina, was of considerable military importance under the Romans.

TERRA COTTA (It., baked earth). Hard-fired earthenware, especially that which is used for architectural material.

Greece. Terra-cotta statuettes are among the most charming and dainty products of Greek art. The archaic terra cottas are numerous, especially on sacred sites. The later figurines from the fourth century B.C. and the Hellenistic period have been found in tombs at many sites, but the earlier group is best represented by the statuettes from Tanagra in Boeotia, which are strongly influenced by the art of Praxiteles and his contemporaries. In the later period the characteristics of Hellenistic art are seen in terra cottas from Asia Minor (especially Myrina), Sicily, and southern Italy. The attractiveness of these figures had led to many imitations, frequently very skillful. The ancient figures were made in molds, sometimes as many as 16 being employed for one figure; then after baking they were often retouched or engraved, and finally painted in brilliant colors on a coating of white lime. For architecture the pieces were finished in true ceramic painting, simple but excellent. In central Italy, especially in Etruria and Latium, crude brick seems to have been largely employed, and hence terra cotta was used for decorative purposes in important buildings at a time when in Greek lands it had been largely supplanted by stone. In this region also terra cotta seems to have been used much more extensively for large figures than among the Greeks.

Middle Ages and Renaissance. Throughout the Middle Ages, baked clay was used in architecture, chiefly for floor tiles, but also for roof-crests and ornamental finials. In the great plain of north Germany, where stone was rare and fictile clay abundant, a whole school of Gothic architecture in brick grew up in the fourteenth century and continued for 200 years; the decorative reliefs modeled in clay and used as capitals, friezes, etc., are of singular interest. Elaborate decorative gables and parapets were made of this material and baked so hard that they are terra cotta rather than brick. In Italy, at the time of the early Renaissance, the material is used very freely in elaborate detail in churches and in private dwellings. Another epoch of art during which terra cotta was freely employed was of the eighteenth century, when, especially in France, terra-cotta statuettes and groups were made in profusion, and vases, clocks, etc., decorated by reliefs and figures in the round, were made for decorative effect. Famous masters of this art were three sculptors of the name of Adam (Lambert Sigisbert, and his brothers Nicholas Sébastien and François Gaspard), and especially Claude Michel, commonly known as Clodion.

Nineteenth Century. In the latter half of the nineteenth century the use of terra cotta as a building material was resumed in connection with the Gothic revival and increasing demand for decorative detail. Late in the century some slight attempts were made to introduce polychromy of a permanent kind in connection with this material. Some of the best terra cotta for buildings is made in the United States; and

here also color has been sparingly used. Among its advantages as a building material are the ease with which it may be molded to any desired architectural or sculptural form and indefinitely repeated, its durability, lightness, strength, and cheapness. It may be made in almost any desired color, but is usually dark red.

Manufacture. A better grade of clay is required for terra cotta than for brick. Often-times clays from different localities must be mixed to secure the right color, while vitrifying ingredients (pure white sand, old pottery or fire brick finely ground) are added to secure partial vitrification. After weathering, the selected clay is ground or washed (see CLAY, *Clay Mining and Working*), mixed with vitrifying ingredients and water; next, the various sorts of clay are piled in layers. Vertical slices from this mass are taken to either a pug mill or rollers for tempering. The material is next sent to the molding room in cakes of convenient size. If only one piece is required, the clay may be modeled by hand, ready for baking; but if the design is to be repeated a model is made and a mold taken, into which the clay is forced by hand. After partial drying the product is turned over to the finisher, who may be more or less skilled, according to the character of the design. After drying, the forms are baked or burned, as described under KILN.

Huish, *Greek Terra-Cotta Statuettes* (ib., 1900). The Etruscan funeral urns are treated by Brunn, *I rilievi delle urne etrusche* (Rome, 1870 et seq.). On the use of terra cotta in architecture consult: Dörpfeld, *Gräber, Borrmann, and Siebold, Ueber die Verwendung von Terrakotten am Giebel und Dache griechischer Bauwerke* (Berlin, 1881). For application of ornamental terra cotta to buildings, consult F. E. Kidder, "Mason's Work," in *Building Construction and Superintendence*, part i (9th rev. ed., New York, 1909). For the manufacture of the various wall and floor fireproofing materials, roof coverings, and other clay goods often going under the name of terra cotta, also for porous terra cotta and terra-cotta lumber, see BRICK; TILE. For the application of these materials, see FIRE-PROOF CONSTRUCTION.

TERRA DEL FUEGO, tēr'ra dēl fwā'gō. A corrupted form of Tierra del Fuego (q.v.).

TERRAMARE, tēr'ra-mā'rā (from It. *terra amara*, bitter earth). The term applied to certain low mounds with level tops in the valley of the Po, which are supposed to have formed the foundations of prehistoric Italian villages. In them are found fragments of bones, pottery, tools, implements of war, and the like, which cast light on the ancient civilization of Italy in the Neolithic period. See ITALY, *Ethnology*; KITCHEN MIDDEN; LAKE DWELLINGS.

TERRANOVA, tēr'ra-nō'vā. A seaport in the Province of Caltanissetta, Sicily, 75 miles

by rail east by south of Girgenti (Map: Italy, E 6). There are tunny and sardine fisheries, and manufactures of woolen goods. The exports are grain, wine, sulphur, soda, and cotton. Terranova was built by Frederick II in the thirteenth century on the site of Gela (q.v.). The ruins of the ancient necropolis have yielded numerous vases, and the excavations of 1906 uncovered the remains of an important temple. Pop. (commune), 1901, 22,114; 1911, 22,019.

TERRAPIN (probably of North American Indian origin). Any of several species of fresh-

EDIBLE TERRAPIN, OR DIAMOND-BACK.

water or brackish-water or mud turtles of the family Emydæ, natives of tropical and the warmer temperate countries. The neck can be wholly retracted within the shell; the head is flat, and the jaws prolonged into a beak. Terrapin feed partly on vegetable food, but also devour fish, reptiles, and other aquatic animals. They swim very well, and even on land move with much greater swiftness than land tortoises. The family is represented in the United States by about 20 species. The word "terrapin" has no exact scientific significance, but in the United States it is more commonly applied to the diamond-back terrapin (*Malacolemys centrata* or *palustris*). This species is found in salt marshes from New York to Texas, and is gray with black markings. Its flesh is highly esteemed as a table delicacy, and in some places along the southern coast these turtles are reared for market in inclosures in large numbers.

TERRAZZO, tēr-rüt'sō. A kind of flooring much used in modern practice for corridors and floors of public buildings; it is composed of small fragments of marble set in a white cement and rubbed to a polish after it has set. By the use of fragments of different colors decorative effects of mosaic may be produced. The process and the name are derived from Italy, where it is called "terrazzo Veneziano." It was introduced into the United States towards the end of the nineteenth century.

TERRE, tēr, LA (Fr., The Earth). One of Zola's Rougon-Macquart novels (1887), in which the author presents a brutally realistic study of peasant life.

TERRE HAUTE, tēr'e hōt'. A city and the county seat of Vigo Co., Ind., 72 miles west by south of Indianapolis, on the Wabash River, and on the Cleveland, Cincinnati, Chicago, and St. Louis, the Vandalia, the Chicago and Eastern Illinois, and the Chicago, Terre Haute, and Southeastern railroads (Map: Indiana, C 6). Terre Haute is the seat of the Rose Polytechnic Institution, Indiana State Normal School, and St. Mary's Institute. Other noteworthy institutions include the Rose Orphans' Home, St. Ann's Orphans' Home, St. Anthony's Hospital, Union Hospital, the Elks' and Odd Fellows' lodges, the Y. W. C. A., and Rose Dispensary. The Emcline Fairbanks Memorial Li-

brary has about 47,000 volumes. The State Normal Library has 65,000 volumes. Terre Haute carries on considerable trade, being the centre of a productive region, largely devoted to agriculture, and containing valuable coal, clay, oil, and gas deposits. The various manufactures (1909 census) had \$10,371,000 capital and a production valued at \$21,793,000. There are also foundries and machine shops, flour and hominy mills, clothing factories, rolling mills, slaughtering and meat-packing establishments, car works, breweries, distilleries, planing mills, and manufactures of carriages, glass, electric motors, stoves, brick, enameled ironware, gunstocks, tools, steel castings, wheels, etc. There are three large ice plants. An important industry of the district is the raising of fine show and harness horses. For maintenance and operation the city spent, in 1913, \$692,500, the principal items being: schools, \$270,000; fire department, \$124,000; police department, \$78,000; for highways, \$64,000; and interest on debt, \$33,000. Pop., 1900, 36,673; 1910, 58,157; 1915, 64,866; 1920, 66,083. Terre Haute was founded in 1816 and was chartered as a city in 1833.

TERRELL. A city in Kaufman Co., Tex., 32 miles east of Dallas, on the Texas and Pacific and the Texas Midland railroads (Map: Texas, D 3). It is the seat of the North Texas Hospital for the Insane, and has a military college for boys, Carnegie library, and an Elks' Home. Terrell is the commercial centre of a region engaged in truck farming, cotton, wheat, and fruit growing, and having besides important cattle-raising and lumber interests. It is also known for the manufacture of cottonseed oil. It has shops of the Texas Midland Railroad, cotton gins, a cotton compress, a flour mill, a foundry, a canning factory, a manufactory of cotton goods, etc. The city has adopted the commission form of government. Pop., 1900, 6330; 1910, 7050.

TERRESTRIAL ELECTRICITY. The science pertaining to electrical phenomena exhibited by the earth and atmosphere. Under normal conditions the surface of the earth is everywhere negatively charged, and the magnitude of the charge density is such that the potential gradient, or increase of electrical potential per meter increase of altitude above the surface, amounts to about 150 volts per meter. The potential gradient shows annual and diurnal variations of very considerable amount; it diminishes with increase of altitude, and probably becomes sensibly zero at altitudes of little more than 10 kilometers, a fact which leads, by a direct application of the fundamental principles of electrostatics, to the conclusion that there is a positive charge in the atmosphere, sensibly equal in total amount to the negative charge on the earth.

The atmosphere possesses the power of conducting electricity to an extent which, though extremely small, is nevertheless sufficient to insure that nine-tenths of the charge on the earth would disappear in 10 minutes if there were no means of replenishing the loss. Although many attempts have been made to account for the permanent existence of an electrical field in a conducting atmosphere, no completely satisfactory theory has yet been evolved. See **ATMOSPHERIC ELECTRICITY**.

The conductivity of the atmosphere arises from the presence in it of positive and negative ions formed by the splitting up of neutral gas mole-

cules. These ions are of two main classes, the so-called small ions, which contribute the greater part of the conductivity, and large ions; the latter move in a unit electrical field with velocities only about 1-3000th of that of the former, and are probably formed by the combination of small ions with dust nuclei. The usual methods of measurement reveal only the small ions, and about 800 pairs of these are usually found per cubic centimeter.

Since ions, when left to themselves, recombine at a rate given by $an+n_-$ where n_+ and n_- are the numbers of positive and negative ions per cubic centimeter and a is a constant, it is necessary to suppose that in the steady state they are produced at a rate q per cubic centimeter per second, equal to this amount. If we leave the large ions out of consideration, the value of q necessary to account for the presence of the small ions is about 1.6.

Radioactive substances are known to emit radiations which possess the power of ionizing a gas (see **RADIOACTIVITY**), and the radioactive materials in the earth and atmosphere over land are known to be sufficient to account for a value of q equal to about 4.3, i.e., a value sufficiently large to provide for all of the measured ions and for some of the large ions as well. There is, however, another important source of ionization in the atmosphere.

If a vessel which has been freed from radioactive air is hermetically sealed, it is found that over land about 10 ions are produced in it per cubic centimeter per second. Calling this quantity in any particular case R , a portion of R must be considered as caused by radioactive impurities in the walls of the vessel itself, but the phenomenon which is responsible for the ionization not produced in this way is called the penetrating radiation. A part of the penetrating radiation is undoubtedly nothing more than that portion (the γ rays) of the radiation from the external radioactive materials in the soil and air which is sufficiently penetrating to pass through the walls of the containing vessel; but over the great oceans, where the radioactive material in the sea water and air is found to be insignificant in amount, values of R equal to about 4 are obtained, and these must consequently be attributed to some other cause. That the whole effect is not a result of impurities in the walls of the vessel is borne out by the fact that R increases very considerably with altitude.

The numbers of ions per cubic centimeter have been found to be as large over the great oceans as over land, or larger, a result amply confirmed by the recent extensive observations made on cruises of the yacht *Carnegie*, belonging to the Department of Terrestrial Magnetism of the Carnegie Institution of Washington. The result is at first sight surprising when it is remembered that the radioactive material, which forms so important a factor in the ionization over land, is almost entirely absent over the great oceans. It is probable that the influence of the greater value of q which must certainly exist over land is offset, as far as the measured ionic numbers are concerned, by a larger proportion of the ions produced over land going into the large type as a result of combination with dust nuclei, and it is not improbable that over the large oceans the ions are practically all of the small type.

Instrumental Appliances. The appliances

for potential-gradient measurements over land are described in the article on atmospheric electricity (q.v.). For ocean work the usual forms of "collector" are unsuitable mainly on account of the difficulty of securing satisfactory insulation. In the apparatus employed on the *Carnegie* a long brass tube, carrying a sort of parasol attachment at one end, is mounted on insulated bearings fixed to the stern rail of the ship in such a way that it can be turned in a vertical plane containing the fore-and-aft line. Relative values of the potential gradient are obtained by measuring the alteration in potential which the insulated system undergoes when it is turned through a fixed angle from an earthed position.

The values of n_+ and n_- are usually measured by drawing air at a measured rate through the space between two concentric cylinders charged to a difference of potential sufficiently high to insure that all of the ions of sign opposite to that on the central cylinder are drawn thereto as the air passes through. The central cylinder is connected to an electroscope, and the alteration in potential of the electroscope during the passage of a known amount of air, combined with a knowledge of the electrical capacity of the apparatus and the charge e on a single ion, leads directly to the evaluation of n_+ or n_- as the case may be.

The conductivities λ_+ and λ_- for positive and negative ions are respectively n_+ev_+ and n_-ev_- , where v_+ and v_- are the velocities under unit electrical field of the particular ion concerned. They are usually measured by a method similar to that for measuring n_+ and n_- , except that the space between the cylinders is wider, and the potential difference between them is less than the amount necessary to extract from the air all of the ions concerned. Under these conditions the theory of the instrument shows that the rate of alteration of the potential of the central insulated system is independent of the velocity of the air; it depends only upon λ_+ or λ_- as the case may be, on the initial potential difference between the cylinders, and on the capacities of certain parts of the instrument.

Estimates of the amount of radioactive material in the atmosphere have generally been made by utilizing the fact that a negatively charged body exposed to air containing radioactive substances collects an active deposit. (See RADIOACTIVITY.) Measurements of the activity of the deposit obtained under specified conditions in this way afford a rough means of obtaining relative values of the amount of active material in the atmosphere. More accurate measurements of an absolute nature are made by drawing the air over coconut charcoal; the charcoal absorbs the emanation, which may subsequently be expelled by heat and measured by its effect in producing ionization in a suitable vessel.

The intensity of the penetrating radiation is usually ascertained by measuring the saturation current I in a hermetically sealed vessel of volume V , provided with an insulated central electrode connected to an electroscope. The value of R is then equal to I/Ve , where e is the electronic charge (4.7×10^{10} E.S.U.).

Upper Atmosphere. Our knowledge of the electrical conditions in the upper atmosphere is very small, and is for the most part a matter of conjecture, but many considerations suggest that at great altitudes the conductivity is enormously greater than at altitudes which are attainable. The chief sources of ionization in the upper at-

mosphere are probably the ultra-violet light from the sun, and the negatively (and possibly positively) charged particles generally supposed to be emitted by that body. These corpuscles, entering the vicinity of the earth's magnetic field, will be deflected thereby according to known laws, and by following out the consequences of this view, Birkeland has formulated a theory (illustrated by many laboratory experiments) in which the aurora is explained by the entrance into our atmosphere of high-speed negative corpuscles from the sun. In order, however, to account for the necessary magnitude of the magnetic deviation, and for the extension of the aurora to low altitudes, it is necessary to postulate that the negative corpuscles have energies very much greater than we are familiar with in laboratory experiments. These difficulties are to some extent lessened by supposing, as Stoermer and Vegard have done, that the particles concerned are, at any rate in part, positively charged atoms of great energy, similar to or identical with α rays.

Estimates of the altitude of the aurora are attended with considerable uncertainty; some claim to have observed it at altitudes as low as 10 or even 1 kilometer. Stoermer has recently made precise measurements of the parallax of its beams and arches, by taking, at stations a few kilometers apart, simultaneous photographs of the aurora and of the brightest stars appearing through it. The altitudes obtained range from 40 kilometers to 260 kilometers. More recently Stoermer has employed the cinematograph to facilitate the following of rapid changes in the aurora.

Earth Currents. During periods of sun-spot activity and magnetic storms (see TERRESTRIAL MAGNETISM) earth currents may attain values sufficiently great to render them a source of serious trouble in telegraphy, but during undisturbed periods they are very small, the potential difference which causes them being only of the order of magnitude of 0.1 volt per kilometer. The general direction of the earth current in Europe seems to be from southwest to northeast.

Earth currents have so far been investigated mainly by measuring the current obtained in a wire terminating in two large plates embedded in the soil at a considerable distance apart; the product of the current so obtained and the resistance of the wire gives the potential difference between the plates, which is the quantity of primary interest. Lines ranging in length from a few meters to thousands of kilometers have been employed, but naturally the electrolytic effects at the plates become a source of serious trouble in the case of the shorter lines. The most extensive series of observations on earth currents are those of Weinstein, extending over a period of eight years and made on two telegraph circuits, one from Berlin to Dresden, 120 kilometers nearly N.S., and the other from Berlin to Thorn, 262 kilometers nearly E.W. The normal earth currents show decided diurnal variations, which are related in a very remarkable way with the diurnal variation of the horizontal intensity of the earth's magnetic field.

TERRESTRIAL EQUATOR. See EQUATOR, TERRESTRIAL.

TERRESTRIAL MAGNETISM. The science which concerns itself with the magnetic properties of the earth and the various phenomena exhibited in consequence of these properties. That the earth has magnetic properties is shown by the behavior of a magnetic needle when freely suspended at any one place on the earth's surface; it is found to take a definite direction, to which it invariably returns when displaced. It is not known as yet whether the earth's magnetism arises chiefly from substances in the magnetized condition exhibited by the natural magnet, the lodestone or magnetic (q.v.), and by the artificial magnet (q.v.), or whether it has arisen as the result of electric currents circulating approximately in the direction from east to west within the earth. In brief, we do not know as yet whether the earth is a magnet or an electromagnet. All that we can say is that the earth acts like a magnet, and that, in consequence, it is surrounded by a magnetic field whose lines of force extend far out into illimitable space; the direction taken by the freely suspended needle, supposed above, is tangent to one of these lines of force. We do know, however, the following definite facts:

a. The systems of magnetic and electric forces which may be responsible for the earth's magnetic field are situated almost entirely below the earth's surface. Indeed, probably not over 5 per cent of the earth's field is caused by systems located in the regions above the surface.

b. The internal system of forces and about half of the external system (the 5 per cent) may be referred to a potential, i.e., if we are dealing with electric currents, they circulate in such a manner as not to cut the earth's surface. A system of electric currents cutting the earth's surface, so as to pass, e.g., from the atmosphere into the earth, or vice versa, is at present supposed to account for the remaining 2 or 3 per cent of the total magnetic field.

c. If magnetized substances cause the earth's magnetic field, then they probably would have to be confined to a stratum extending down not over 10 miles below the surface, for beyond this depth temperatures would be encountered at which, as far as we know, substances could not exist in the magnetized state. Whether or not the increase of pressure encountered as we penetrate into the earth's interior would tend to counteract the deleterious effect of increased temperature on magnetized substances is not definitely known. However, the increase of temperature with depth would be conducive to the production of a magnetic field caused by electric currents.

d. Roughly, 65 to 70 per cent of the earth's magnetic field can be represented by a formula based on some kind of uniform magnetization

(see MAGNETISM) parallel to a diameter inclined about 11.5° to the earth's axis of rotation. At present the average effective intensity of magnetization (magnetic moment per unit of volume), in C. G. S. units, is about 0.07, and the magnetic moment of the entire earth, if R be the earth's mean radius, $0.32R^3 = 0.32 \times (6.37 \times 10^8)^3 = 8.3 \times 10^{25}$. The earth's average intensity of magnetization is about $\frac{1}{10,000}$ that of very highly magnetized steel.

e. The earth's magnetic field is more or less unstable and is in a continual state of flux. External causes may, in a moment, cause a change amounting at times to as much as 5 per cent of its apparently permanent intensity of magnetization (ρ). Generally this derangement may be regarded as being caused by a demagnetizing system, the effect of which is equivalent to a diminution in ρ which may last for a comparatively long period. Thus it took the earth's magnetic field about three months to recover from the effect of the exceptionally severe magnetic storm of Sept. 25, 1909.

The earth's complex magnetic field may be resolved into the following main magnetic systems: (1) The polar system—a uniform magnetic system, symmetrical about and parallel to the earth's axis of rotation, oriented so as to cause the north end of a magnetic needle to point everywhere north, and below the horizon, in the Northern Hemisphere; (2) the equatorial system—a uniform magnetic system of about one-fifth of the strength of (1), symmetrical about and parallel to a diameter lying in the equatorial plane, oriented, did it alone exist, so as to cause the north end of a magnetic needle to point everywhere at present towards a subsidiary pole on the equator in longitude about 70° west of Greenwich; (3) the distorting, transverse system giving rise to a subsidiary magnetic field approximately of one-fifth of the strength of the combined system (d), composed of (1) and (2), asymmetrical both about the earth's axis of rotation and its equatorial plane, oriented in opposite directions in the Northern and Southern Hemispheres; (4) regional and local disturbance systems. Were systems 1 and 2 alone existent, magnetic observations at but very few places would suffice to determine the positions of the magnetic poles (see below) and to calculate in turn, with high accuracy, the values at all other places on the earth of the magnetic elements (q.v.): declination (D), inclination or dip (I), and horizontal intensity (H), or the horizontal component of the total strength of the field. Owing, however, to the effects from systems 3 and 4, no formula has as yet been established which will yield computed values of the magnetic elements with accuracy sufficient for even the purely practical purposes of the surveyor and the navigator. Nor has any one as yet succeeded in establishing laws by means of which reliable values of the magnetic elements could be predicted for any place on the basis of the existing values. Hence the need of magnetic surveys of land and ocean areas for determining by actual observation the prevalent values of the magnetic elements at sufficient places for the construction of magnetic charts.

Magnetic Charts. Nearly every civilized country has organized magnetic services for the purpose of charting the magnetic elements. The most extensive work of this kind at present is

being done by the Carnegie Institution of Washington, through its Department of Terrestrial Magnetism. This organization has as its special aim the securing of magnetic data in regions, either not within the jurisdiction of any one country, or where, for one reason or another, there are no existing data nor any likely to be obtained in the near future. Since 1905 its expeditions have been sent to almost every region of the globe, and magnetic data have been secured in all the oceans on cruises of aggregate length nine times that of the earth's circumference. The specially constructed non-magnetic

the compass direction were occurring in 1916 in the following regions: Along the northeastern coast of Brazil, where the north end of the compass was moving westward at the annual rate of about 16'; along the extreme southeastern coast of Africa, where the north end of the compass was moving eastward at the annual rate of about 14'. The largest annual change in the magnetic dip was about 18' (increase of dip of north end of needle below the horizon), and was occurring in Colombia, South America.

The curves (Fig. 3) represent those described in the course of time by the north end of freely

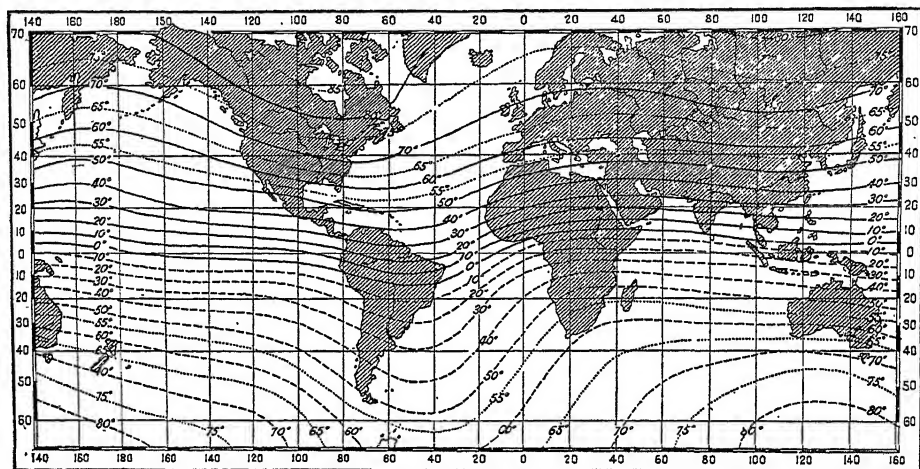

Fig. 1. Chart showing lines of equal magnetic inclination for the earth in 1905 (British Admiralty). The north end of the dip needle points below the horizon in all of the region (north magnetic hemisphere) north of the zero line (magnetic equator), and above the horizon in all the region (south magnetic hemisphere) south of the line.

vessel, the *Carnegie*, reached the parallel of 80° N., off Spitzbergen, in 1914; in 1915-16 she circumnavigated the region between the parallels 50° to 60° S. By the end of 1917 this department, it is expected, will be able to undertake the construction of world-magnetic charts, with an accuracy and detail not heretofore possible. The accompanying plate shows the lines of equal magnetic declination, or isogonic lines (q.v.), and of equal annual change for the United States in 1915, and the second plate similar lines for the earth in 1915. Under DECLINATION will be found a table of Magnetic Declinations and Annual Changes in the United States for Jan. 1, 1910. Fig. 1 shows the lines of equal inclination or isoclines (q.v.) for the earth in 1905. Similarly there are charts giving the lines of equal horizontal intensity, of equal vertical intensity, and of equal total intensity of the earth's magnetic field. See ISODYNAMIC LINES; ISOMAGNETIC LINES.

Secular Variation of the Earth's Magnetism. The various magnetic elements suffer from year to year more or less progressive changes which continue for a period the length of which is not known at present; it may be as long as 1500 years or more. It is not even known whether or not the secular change is a strictly periodic one. Suffice it to say that because of this long-period change the earth's magnetic state undergoes such remarkable changes that it is necessary, even for the purely practical purposes of navigation, to issue new magnetic charts of the earth at intervals preferably not longer than five years. The largest annual changes in

suspended magnetic needles at London, Boston, and Baltimore, the motion being viewed by an observer supposed to be standing at the point of suspension of the needle. It will be seen that the area of the London curve is considerably larger than those of the United States stations,

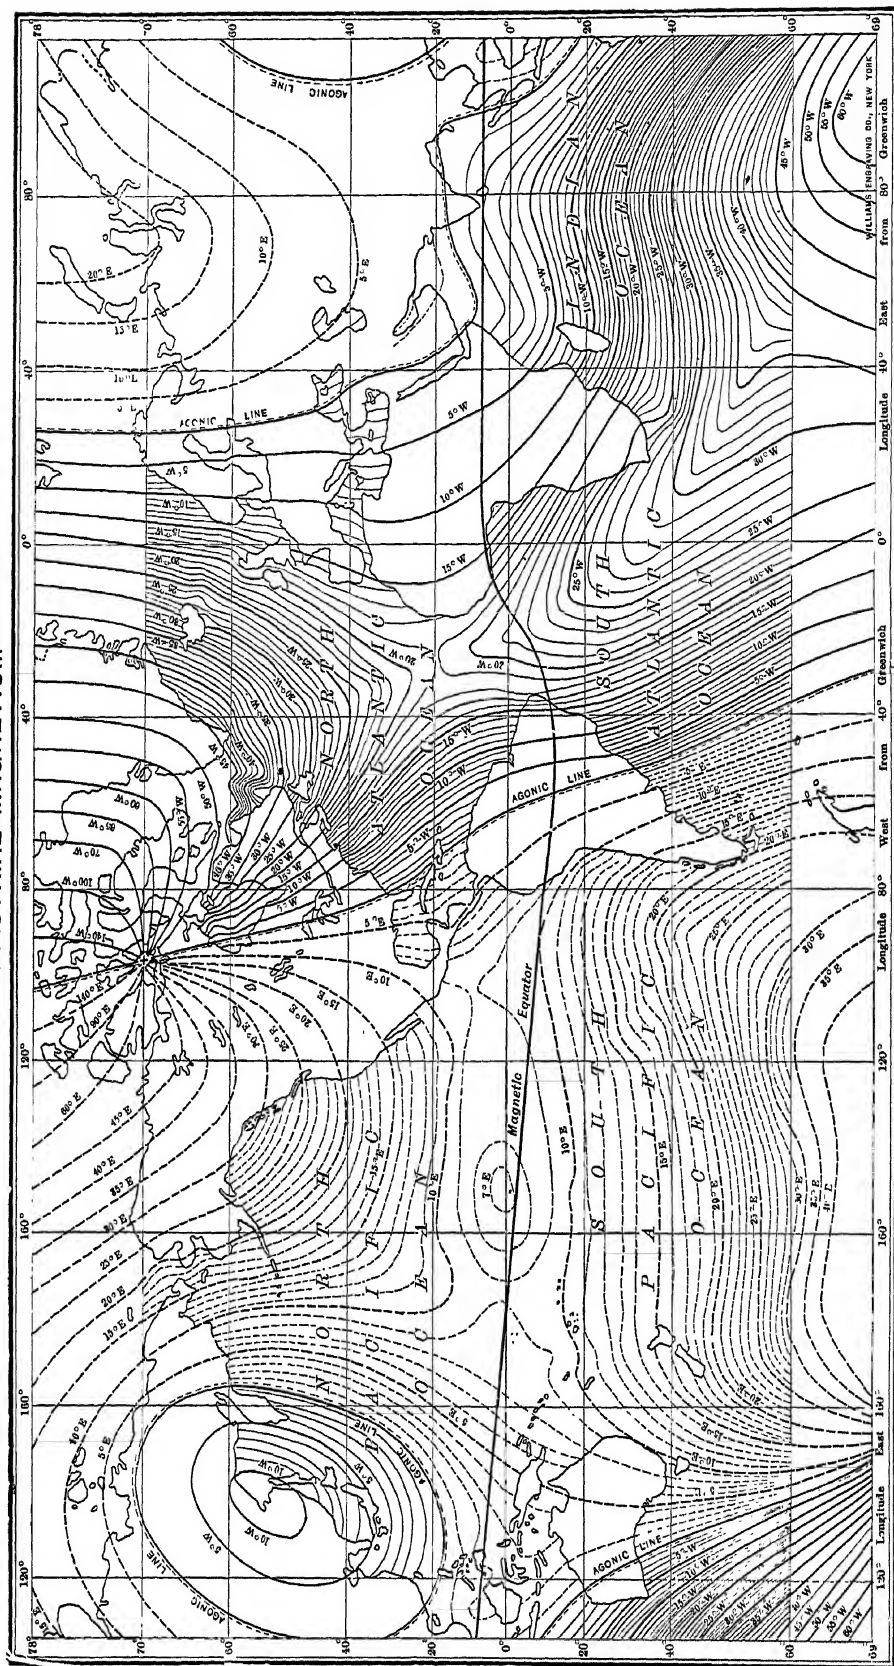

Fig. 2. Showing the direction assumed by a dip needle in various parts of the earth. Some idea of the complexity of the earth's magnetic field is gained by the amount of departure of the magnetic equator from the true equator.

or, in other words, the secular changes in declination and inclination appear to be larger for England than for the United States. However, we do not know what may have occurred in the United States prior to the date when the ob-

According to the United States Coast and Geodetic Survey.

The north end of the compass needle is moving to the westward for places east of that line at an annual rate indicated by the lines of equal annual change.

TERRESTRIAL MAGNETISM

LINES OF EQUAL MAGNETIC DECLINATION FOR THE EARTH IN 1915

Based on the United States Hydrographic Office Chart, with additions

East lines indicate west declination, and broken lines, east declination. The approximate position of the North Magnetic Pole is shown by a +; the heavy line marks the approximate

servations began, nor can we predict what the future changes will be. For example, the London curve may not close itself, if it ever does, in a simple manner; there may be introduced one or more loops of area smaller than that of

FIG. 3. Curves showing the secular change in the magnetic declination and in the inclination (dip) at London, Boston, and Baltimore. [Drawn for supposed length of freely suspended magnetic needle of about 37 centimeters, or nearly 15 inches.]

the present curve. There is some evidence that such loops may have occurred several centuries ago, and there is no reason why they may not occur again.

Table I shows the irregularities in the secular change from year to year at a typical station, Cheltenham, Md., where a magnetic observatory is in operation under the auspices of the United States Coast and Geodetic Survey.

Magnetic Poles. The approximate position of the north magnetic pole in 1916 was lat. 70° N., long. 97° W., and of the south magnetic

pole, lat. 72° S., long. 153° E. A straight line connecting these two poles would pass through the earth 750 miles distant from the centre. We do not possess observations sufficiently extensive,

or of requisite accuracy, to determine definitely the paths followed by the magnetic poles as the result of the secular change in the earth's magnetism. Nor do we know as yet the precise cause for this mysterious change. It has been shown, however, that the system of forces causing the changes is a resultant one, composed of a system inside the earth and of another above the earth's surface. It is also known now that the secular change is caused not only by a change in the direction of magnetization but likewise by a change in the intensity of magnetization. The earth's magnetic moment during the past three-quarters of a century appears to have been diminishing at the average annual rate of about $\frac{1}{2400}$ part. But it is not known whether this apparent decrease will continue.

Diurnal Variation of the Earth's Magnetism. This is one of the most striking of the earth's magnetic phenomena. The magnetic elements run through a certain course having the solar day as period, the ranges of the changes being greater in the summer months than in the winter months, and greater during periods of maximum sun-spot activity than during periods of minimum sun-spot activity. Table II shows the diurnal changes for a typical station,

Cheltenham, Md., for a summer month (August) and a winter month (January), and for the year 1912, near the epoch (in 1913) of minimum sun-spot activity. A + sign means motion of north end of compass needle to the east, motion of north end of dip needle downward, and an increase in the horizontal intensity. Thus, at Cheltenham the mean values of the magnetic elements were, in 1912: declination, $D = 5^\circ 50.0'$ west; inclination, $I = +70^\circ 39.1'$ (+ means north end of dip needle down); horizontal intensity, $H = 0.19702$ (C. G. S. unit). At 8 A.M., on the average in August, 1912, $D = 5^\circ 44.7'$ west, $I = +70^\circ 40.2'$ $H = 0.19681$. At 1 P.M.,

on the average in August, 1912, $D = 5^\circ 55.6'$ west, $I = 70^\circ 38.5'$ $H = 0.19712$. The turning points (maxima and minima) are indicated in the table by heavy black figures and italicized figures. The ranges (difference between maximum and minimum values) are given at the bottom of the table.

For a year of maximum sun-spot activity the diurnal ranges are, in general, increased, the percentage increase being greater for the winter months than for the summer months. The

Fig. 4. Showing the diurnal variation of the magnetic declination at Baldwin, Kan., in December and August, 1901.

mean annual ranges at Cheltenham were approximately 30 to 40 per cent greater in the year of maximum sun-spot activity than they were in the year of minimum sun-spot activity.

Confining attention chiefly to the diurnal variation of the magnetic declination (Fig. 4) at an average station in the Northern Hemisphere, we may say broadly that the north end of the compass needle moves eastward in the morning hours until about seven or eight o'clock, and then turns and moves westward until about one o'clock in the afternoon. For an average station in the Southern Hemisphere, the motion just described would be reversed as far as the north end of the compass is concerned, though for the south end it would be the same.

It is seen (Table II and Fig. 4) that the diurnal variation for all the elements is developed chiefly during the daylight hours. The seat of the system of forces causing the magnetic diurnal variation is chiefly above the earth's surface, though a large percentage of the variation arises also from a system situated within the earth.

Acyelic Effect. The diurnal variation is not a strictly cyclic phenomenon, i.e., the mean daily values of the magnetic elements, even on undisturbed days, are not necessarily the same on one day as they were the preceding day or as they will be on the following day. One cause of this is of course the slowly progressing change. But there is a more serious cause for acyclicism, which, if it persisted throughout the year, would give a secular change 10 to 100 times larger than is actually found, i.e., if a pair of consecutive, magnetically calm days be selected, then it is found that the mean daily value of the horizontal intensity on the second day is, on the average for the year, slightly greater than on the first day; this effect is known as the acyclic effect. On the other hand, the general effect of magnetic perturbations, or of magnetic storms, is to diminish the horizontal intensity. Now the magnetically disturbed days outnumber the quiet days at least two to one. The acyclic effect of the nondisturbed days is thus counterbalanced, in a measure, by that of the disturbed days, so that the residual effect at the end of the year is reduced, i.e., at Cheltenham,

Md., at present to about 2 or 5 per cent of the regular secular change.

Annual Variation of the Magnetic Elements. Aside from the progressive change throughout the year, caused by the secular variation, the earth's magnetic state undergoes changes varying with the season and having the year as period. The total range of these changes for the magnetic declination, or for the magnetic inclination, is usually about a minute of arc or less. The most instructive feature is best ex-

hibited by the changes in the horizontal and in the vertical intensities, when grouped as shown in Table III. A plus sign means that the value of the magnetic element was at the time numerically greater than its mean value for the year; if the vertical

intensity be given the plus sign for the northern magnetic hemisphere, and the minus sign for the southern magnetic hemisphere, then the signs in the table for this element should be reversed for the Southern Hemisphere.

It is evident from this table that the magnitude and signs of the changes depend upon the earth's motion in declination during the year, and that the changes, for the same time of year, are, on the average, of opposite signs in the Northern and Southern hemispheres. The seat of the system of forces giving rise to the annual

TABLE III

variations of the magnetic elements is chiefly above the earth's surface.

Magnetic Storms and Perturbations. These are sudden, spasmodic changes in the earth's magnetic state, of greater or less severity, occurring quite frequently. They are usually accompanied by displays of polar lights and the generation of electric currents in the earth, sufficiently strong to interfere seriously with transmission of telegraphic signals. (See TERRESTRIAL ELECTRICITY.) During periods of severe magnetic storms, such as occur most frequently near times of maximum sun-spot activity, compasses may be deflected by a whole degree and, at times, by several degrees at places even in medium latitudes. In the polar regions, during such periods, the compass deflection may be many degrees. Magnetic storms in general have a wide area of action and their effects may be felt all over the earth at nearly the same instant of

time. Sometimes, however, there are storms, usually less severe in intensity, which may be more restricted in their area of action, e.g., may make themselves felt only in the sunlit region of the globe.

Corresponding Solar and Terrestrial-Magnetic Changes. It has been known for many years that there are changes in the earth's magnetism which run an approximately parallel course with changes in the sun's activity, as indicated, e.g., by sun spottedness. In general, it is found that the ranges of the diurnal changes of the magnetic elements are larger, and magnetic storms are more frequent and more severe during the period of maximum sun-spot development than during the period of minimum development. The magnetic and solar changes here discussed follow approximately the same periods, of which the so-called sun-spot period, 11.4 years, is the chief one; subordinate periods of about 22 and 70 years are also indicated. The correspondence between these magnetic and solar changes is, however, not exact, either as regards time of occurrence or as to magnitude. The epoch of minimum sun-spot activity occurred recently in 1913, while the epoch of minimum magnetic activity of the earth had taken place the year before. Thus we cannot predict from an observed group of sun spots the precise time and severity of a magnetic storm on the earth.

There appears to be some correspondence between certain magnetic changes and changes in the solar radiation, as shown by the solar-constant values observed by the Smithsonian Institution at Mount Wilson, Cal., 1905-15. Neither sun-spot numbers, sun-spot areas, calcium flocculi, solar protuberances, nor solar-constant values, however, may be regarded as fully indicative of the character or magnitude of the agencies responsible directly, or indirectly, for the magnetic changes. It seems probable that the latter are initiated by such solar radiations and emissions (ultra-violet rays, electrically charged particles, etc.), which may ionize the upper atmospheric levels (see **TERRESTRIAL ELECTRICITY**) and thus cause an alteration in the electric conductivity at these levels. The changes in conductivity in turn may be responsible, in conjunction with the energy of the earth's rotation, for the magnetic fluctuations and magnetic storms associated apparently with solar changes.

Minor Magnetic Fluctuations. Chief among these is the lunar-diurnal variation, having as a period the lunar day, and characterized chiefly by a double oscillation, during 24 hours, like the earth's tides. The range from crest to trough of a single oscillation is usually less than one minute of arc. There is also a magnetic fluctuation dependent upon the moon's declination and phase. Some investigators also believed that they had detected with certainty a small terrestrial-magnetic fluctuation having the sun's rotation as period. The more sensitive the recording instrument, the more evidence is furnished that the earth's magnetic state is in continual flutter. Some of the elemental fluctuations have an amplitude of only a fraction of a minute of arc, or of 0.00001 part of the horizontal intensity, and a period ranging from a fraction of a second to a fraction of a minute. There are also often shown on recording instruments, even of ordinary sensitiveness, more or less rhythmic fluctuations

(pulsations) of small amplitude, lasting at times several hours.

Local Disturbances. There are a number of places, distributed over the earth, where, because of local deposits of substances affecting the magnetic needle, the magnetic elements have abnormal values. These local centres of attraction are at times sufficiently intense to cause a compass to point to them and a dipping needle to stand vertical, just as it would at the magnetic poles. Such centres may deflect compasses on board ships several miles away, and cause shipwreck, if the mariner fails to make proper allowance. These phenomena indicate interesting correlations between geological formations and regional disturbances in the earth's magnetic field. Consult Rücker and Thorpe's "Magnetic Survey of the British Isles for 1891," vol. clxxxviii, Series A, *Philosophical Transactions of the Royal Society*, London, 1896.

Instruments and Methods. The limits of this article will not permit detailed descriptions of the most modern instruments used in land and ocean magnetic surveys and at magnetic observatories, nor will it be possible to enter into the latest methods of observation. It must suffice to refer the interested reader to the articles **MAGNETOGRAPH**, **MAGNETOMETER**, **DECLINOMETER**, **DIP CIRCLE**, **COMPASS**, and to the references given below.

Solar and Planetary Magnetism. In 1913 it was shown by Hale, of the Mount Wilson Solar Observatory, that the sun, like the earth, is enveloped by a magnetic field. The sun's north magnetic pole is near the sun's true north pole, just as is the earth's north magnetic pole near its true north pole, hence the polarity of the sun's magnetic field is the same as that of the earth. The strength of the solar field, at the magnetic poles, is about 80 times that of the earth's at its poles, which is about 0.65 C. G. S. unit. If the sun at a temperature so high that no substance, as far as we know, could be in a magnetic state, nevertheless possesses a magnetic field, the question arises as to what common cause could give rise to a magnetic field for a hot body, like the sun, and a comparatively cold body, like the earth. The query first raised by Schuster as to whether every large mass rotating with sufficient speed may not be a magnet is one receiving at present much serious attention. If size, density, and angular velocity are sufficient requisites, then there is no reason why every one of our planets, or celestial bodies, may not also be endowed each with a magnetic field. And it may thus transpire that the interacting magnetic effects of the members of our solar system cannot be neglected in astronomy of precision. Even now astronomers are seeking some magnetic cause to account for outstanding motions in the moon, Venus, Mercury, and the sun, which cannot be explained on the gravitation theory alone.

Origin of the Earth's Magnetism. If it should be found possible to prove the existence of a magnetic field for another rotating body, like Jupiter, e.g., then the belief would be greatly strengthened that rotation of a large mass is the chief cause for the observed magnetic field. Unfortunately, the proof as to rotation being the chief cause appears to be beyond present laboratory appliances. There are various facts which point strongly to rotation as being the chief agency involved in the production of the magnetic fields of the earth and of the sun.

Bibliography. Bauer, *Principal Facts of the Earth's Magnetism* (Washington, 1902); Hazard, *Directions for Magnetic Measurements* (ib., 1911); Mascart, *Magnétisme terrestre* (Paris, 1900); Chree, *Studies in Terrestrial Magnetism* (London, 1912); Nippoldt, *Erdmagnetismus, Erdstrom und Polarlicht* (Berlin, 1912); *Journal of Terrestrial Magnetism and Atmospheric Electricity* (Baltimore, Md., annual); Reports of the Division of Terrestrial Magnetism, United States Coast and Geodetic Survey (Washington); also "Researches of the Department of Terrestrial Magnetism," in Carnegie Institution of Washington, *Publication No. 175* (2 vols.); these two volumes describe latest instruments and methods of observation and give results of land magnetic observations in all parts of the earth (1905-13). See ELECTRICITY; MAGNETISM; TERRESTRIAL ELECTRICITY.

TERRESTRIAL TEMPERATURE. See TEMPERATURE, TERRESTRIAL.

TERRIER (OF. *terrier*, from ML. *terrarius*, from Lat. *terra*, earth, land, so called from its scratching the ground in pursuit of prey). A small active domestic dog, used to catch rats. Sixteen distinct breeds are officially recognized, several having two subvarieties—rough-haired and smooth. The earliest authentic mention of the terrier is by Dr. Caius, who wrote a Latin treatise on the dog before 1572. He enumerates among the British dogs "the terrare," described as a hunter of the fox and badger. This breed was what is now called a fox terrier, at that time black-and-tan, or pied with white or yellow, of which a large and a small variety were bred. The larger variety became a rough-haired, strong animal, the foundation stock of the English white terrier. This breed, crossed with the bulldog, produced the bull terrier, a dog of infinite courage, out of which, however, all other bulldog characteristics have been eliminated. The fox terrier was gradually degraded into a fighting dog, and so lost caste that it became nearly extinct, but was revived about 1865, and became the most popular of all terriers as a house pet as well as useful about the stable. While in one direction all the color was being bred out of the original terrier to produce the white dog, in another direction all the white was being eliminated to produce the pure black-and-tan, until that race was perfected. From the smaller specimens of this breed came, by selection, the toy black-and-tan weighing as little as three pounds. The Welsh terrier is a large wire-haired black-and-tan; the Irish terrier is a wire-haired yellow variety, claimed to be indigenous and of the highest antiquity. The Bedlington is a wire-haired variety supposed to be a cross between the low-legged, wire-haired Dandie Dinmont and the otter hound, but it much more strikingly resembles the Irish water dog. The Airedale is a cross of the rough-haired English terrier with the otter hound; and the Boston terrier is a cross of a smooth-coated terrier with the bulldog.

In contrast to the above group of long-legged, short-bodied, up-standing dogs, with either rough or smooth coats, are the long-bodied, short-legged dogs, with a long and silky covering. This latter group were originally developed in northern Scotland. They are the Scotch, a rough wire-haired variety; the Dandie Dinmont with a woollier coat; and the Skyes and Clydesdales with long silky coats. The Yorkshire is the only English specimen of the low-bodied, silky-haired

terrier. Japan boasts the shan-tung, which is almost indistinguishable from the Skye; and the Maltese terrier, named from the island, has a coat as long and silky as a Blenheim spaniel.

The characteristics of standard varieties are as follows: The fox terrier is generally lively and of active appearance, with bone and strength in small compass, capable of speed and endurance, and weighing about 20 pounds. The head must be broad between the ears and decreasing in width to the eyes; nose tapering and black; ears V-shaped and drooping forward close to the cheek; jaws strong and muscular; legs straight and strong. The coat of the smooth variety is flat and abundant; of the wire-haired, hard, wiry, and broken. The tail, usually docked, is set on high and carried gayly, but not over the back. The bull terrier is a short-haired terrier, weighing from 15 to 50 pounds, of perfect symmetry, the embodiment of agility, grace, and determination. An all-white coat is most approved, but the American standard permits markings. The tail is left uncropped; in America cropping of the ears is permitted by the standard, but not in England. The black-and-tan is judged in three classes not exceeding 7 pounds, 16 pounds, and 20 pounds respectively. He is a typical terrier, jet black, marked with deep tan as follows: On the head the muzzle must be tanned to the nose, which is black; a bright spot of tan on each cheek, and above each eye; chin, throat, and inside of the ears, and the forelegs up to the knees are tan, with black lines up each toe, and a black thumb mark above the foot inside the hind legs. The Welsh terrier is a wire-haired variety, black or grizzle and tan in color. They are 15 inches high at the shoulder and 20 pounds in weight. The Irish terrier is a wire-haired variety, whole-colored, bright red or wheaten yellow, weighing 24 pounds, active, lively, and lithe—a gamy dog, but with the kindest disposition. The Bedlington is a rough-looking, loosely built dog, with the least general expression of the true terrier. He is 15 to 16 inches high and weighs 24 pounds. His coat is shaggy and usually dark blue. The Airedale, the latest and largest variety, weighing 40 to 45 pounds, is a wire-haired dog, with crown, back, and sides black, and face, throat, and limbs tan; the tail is docked, and the aspect square, trim, and powerful. The Boston terrier is a pet dog of recent creation, which is as much bulldog as terrier, but has lost the wrinkled face and bowed legs of the former, while retaining its brindled markings and screw tail. It weighs 15 to 30 pounds, and is judged in two classes, large and small. The Scotch terrier is a long-barreled, bow-legged, rough-haired dog, weighing from 18 to 20 pounds, with prick ears, and tail carried straight up. This dog has a very sharp, bright, and active expression. His coat is intensely hard and wiry, dense all over his body, and iron gray, grizzly, or black in color, though sometimes sandy. His feet are large, with strong claws, and he is most capable in unearthing vermin. The Dandie Dinmont is from 8 to 11 inches high, weighs from 14 to 24 pounds, and has a mixed coat of hard and soft hair, and a salt-and-pepper color. His ears are long and pendulous. The Skye terrier, a good vermin dog, and built low and long (from 8½ to 10 inches high and 22½ inches long), has two coats, the under one short, close, soft, and woolly, the top one 5½ inches long, hard, straight, flat, and free from crisp or curl. The ears and tail are

feathered with long soft hair and the tail is never carried higher than the line of the back. In color it is usually a light blue, gray, or fawn. The Clydesdale, or Paisley, is practically a little Skye with smaller ears, set high and perfectly erect. It is covered with long silky hair, hanging in a fringe down the side of the head. The Yorkshire is also practically a smaller Skye, with a more silky coat. He is judged in two classes, one under 5 pounds and another from 5 to 12 pounds. The Maltese was the lap dog of the Greeks and Romans of the classic period—a small, short-legged dog, not exceeding 6 pounds in weight, with pure white, rather transparent wavy hair, not less than 7 inches long. It is called terrier by its devotees, but it might as reasonably be called a spaniel or toy dog. It has almost if not entirely disappeared from Malta. See Dog and references there given.

TERRISS, WILLIAM (1847–97). An English actor, whose true name was William Lewin. Born in London, he studied medicine at Christ's Hospital in that city, later was in the merchant service, and after various adventures made his first appearance as an actor at Birmingham in 1867. Immediately successful, he appeared in the London theatres in the following year as Lord Cloudrays in Robertson's *Society*, and subsequently as Squire Thornhill in Wills's *Olivia* (1878); Chateau-Renaud in *The Corsican Brothers* (1880); and in Shakespearean rôles. He made an American tour with Sir Henry Irving in 1883, and one with Miss Millward in 1889. He was assassinated by a madman. His daughter, **ELLALINE TERRISS**, also became well known as an actress, playing with her husband, Seymour Hicks (q.v.). Consult Arthur J. Smythe, *The Life of William Terriss* (London, 1898).

TERRITORIAL WATERS. Waters which are subject to the jurisdiction of a sovereign state as distinguished from the high seas (q.v.). They may be divided into waters lying within the state, waters which are boundaries between states, and waters upon the coast. The law in regard to the first two classes may be definitely stated and is settled. Waters lying within a particular state are subject only to the jurisdiction of that state. When, however, they are the means of communication between two portions of the high seas, such as straits, the Dardanelles, the Bosphorus, the Suez and the Panama canals (qq.v.), the regulation of navigation is usually fixed by treaties, but is governed by the principle of international law that they are to be used by all nations for the innocent passage of vessels not of war. Treaties and this principle of international law also govern waters which are within the territory of a particular nation, but which are outlets to the sea, such as the rivers Rhine, St. Lawrence, and the Amazon. In the United States each State exercises jurisdiction over waters lying wholly within the State, unless they form part of the system of interstate waterways, in which case they are subject to the control of the Federal government under the power granted by the constitution. Over waters which are boundaries between two sovereign states, such as lakes, rivers, and narrow bodies of water, jurisdiction is fixed by treaties and is now settled. An imaginary line drawn through the centre of such bodies of water is usually the limit of jurisdiction. Territorial waters on the coast are not clearly defined. The question which most frequently arises is the point on the high seas to which

jurisdiction of a state extends. The former theory of international law was that the jurisdiction extended for three miles from low-water mark. This strip along the coast is what is known as the maritime belt, and the theory on which jurisdiction is recognized was based on the cannon shot of the period, but the changed condition of warfare may modify the extent of this territorial jurisdiction. For revenue purposes, for the protection of special industries, such as fishing and other reasons, various limits beyond the three-mile line have been claimed and acknowledged from time to time; e.g., such questions have arisen as to the status of the Bay of Fundy, the bays in Alaska, in the Bering Sea controversy (q.v.). The general rule is that arms of the sea which are not more than 10 miles apart are territorial waters. Claims have been made both by the United States and Great Britain of control over bodies of water with larger openings. The Hague Convention of 1882 adopted 10 miles between headland and headland as the limit. The House of Lords decided that Conception Bay, Newfoundland, was territorial water, although the headlands were 20 miles apart. Chesapeake Bay with headlands of 12 miles apart is conceded to be territorial water. The Hague Convention of 1907 confirmed the law and practice then existing. The subject was to be considered at the next Hague Conference. The questions involved were to be fisheries, the rights of neutral nations in naval warfare, and the jurisdiction of the state over vessels and acts committed upon vessels within territorial waters. In general, it may be stated that in all territorial waters there is a recognized common right of navigation for all nations and especially to the proprietary nation in time of war. The principle of self-protection is recognized by the Hay-Pauncefote Treaty in regard to the Panama Canal, and it is to the interest of all nations to provide the utmost liberty of navigation. A state has always the right to refuse access to armed vessels of other states. Where the coastal line is indented the question arises as to how far bays and other large bodies of water may be considered within the territory of a particular sovereignty. The nature of the sovereignty does not mean ownership, but it is a right of jurisdiction limited to the protection of its coast from the effect of hostilities between other belligerent states, the regulation of fisheries and the prevention of frauds upon the customs and its laws. The authority of a sovereign state cannot extend beyond its boundaries. Its boundary is not the high seas (q.v.), but for purposes of international law is considered as including the maritime belt. It may prevent ships approaching with intent to violate its laws. The exclusive jurisdiction is both civil and criminal over vessels within territorial waters, although concurrent jurisdiction is sometimes given by convention to the state owning the vessel over criminal acts committed on foreign vessels in such waters. It is in consequence of this principle of law that during the Great War vessels of belligerent nations have sought the protection of the harbors and ports of the United States. Such vessels are subject to the jurisdiction of the United States. On the same principle American vessels which have entered the territorial waters of foreign nations are subject to the jurisdiction of those nations. The law of nations requires every national govern-

ment to use due diligence to prevent a wrong being done within its own territory to any other nation with which it is at peace. The distinction is made between merchant ships and ships of war. A foreign ship of war or any prize of hers within a port of the United States is not subject to local jurisdiction, but a prisoner on board such vessel may be released on habeas corpus issued by the courts of the United States. This, however, is on the ground of international comity and is usually regulated by treaty. The laws of one country are sometimes administered in the territory of another, as in certain established ports in eastern countries known as consular courts. Consult J. B. Moore, *International Arbitration* (6 vols., ib., 1898); F. Wharton, *Digest of International Law of the United States* (2d ed., 3 vols., Washington, 1887); L. Oppenheim, *International Law* (2 vols., London, 1905-06); R. de Villeneuve, *De la détermination de la ligne séparative des eaux nationales et de la mer territoriale* (Paris, 1914). See **MARE CLAUSUM**.

TERRITORIES (OF. *territoire*, Fr. *territoire*, from Lat. *territorium*, district, from *terra*, earth, land). The name given in the United States to certain parts of the national domain which have not been erected into States. In 1916 they were the District of Columbia, and Alaska on the continent, Porto Rico in the West Indies, and Hawaii, the Samoan Islands, Guam, and the Philippine Islands in the Pacific. They may be classified, under their present status as political bodies, as (1) unorganized Territories; (2) the Federal District; and (3) the insular possessions. In the first class belongs Alaska. Hawaii among the insular possessions has a popularly elected local Legislature of two chambers chosen for a term of two years by a suffrage determined by local law. This legislative power extends to all rightful subjects not inconsistent with the Constitution and laws of the United States, but any law passed is subject to the veto of Congress. The executive power is vested in governors appointed for a term of four years by the President of the United States with the consent of the Senate. The other important officers of the Territory are likewise appointed by the President and are paid from the Treasury of the United States. The Territories are not regularly represented in Congress, but are allowed to send a delegate, who is given a seat in the House of Representatives with a right to take part in the debates, but not to vote. For the Government of Alaska, the District of Columbia, Porto Rico, the Samoan Islands and the Philippine Islands, see separate articles under these titles.

By the United States Constitution the national Congress is given power "to make all needful rules and regulations respecting the territory or other property belonging to the United States." From the beginning this clause was construed as giving the powers incident to jurisdiction as well as to ownership, and even before the adoption of the Constitution the Northwest Territory was regularly organized by the old Confederation Congress, which for this purpose passed the famous Ordinance of 1787. (See **NORTHWEST TERRITORIES**.) This ordinance served as the model for much of the subsequent legislation in the same field, though there were a number of important variations. Thus, in the organization of the Territories of Tennessee and Mississippi the clause of the Ordinance of 1787

prohibiting slavery was omitted. Of the present States of the United States all, except the original 13 and Vermont, Maine, Kentucky, West Virginia, Texas, and California, have passed through the Territorial stage. Vermont, Kentucky, Maine, and West Virginia were each formed out of territory which belonged to one of the original 13 States, and Texas and California were regularly admitted to statehood without ever having been organized as Territories. The size of many of the Territories, however, differed widely from the size of the States which bear the same names, and there has been a radical changing of boundaries. Thus the Territory of Mississippi originally included Alabama; the Territory of Indiana as organized in 1804 contained all of the Northwest Territory except Ohio; the Territory of Illinois as organized in 1809 included the land now constituting the States of Illinois and Wisconsin, and part of Upper Michigan; the Territory of Michigan after 1834 included all of the territory north of Missouri, Illinois, Indiana, and Ohio, and between Lakes Erie and Huron and the Missouri River; the Territory of Oregon as organized in 1848 covered all the territory of the United States north of lat. 42° N., and west of the Rocky Mountains; Nebraska Territory as organized in 1854 contained land now in Montana, the Dakotas, Wyoming, and Colorado.

The Territorial stage is one of preparation for the Commonwealth status. The Constitution empowers Congress to erect the Territories into States and admit them into the Union whenever it sees fit. Usually when the Territory has a population equal to that of an average congressional district the inhabitants memorialize Congress to pass an "enabling act" empowering them to form a constitution, and prescribing the conditions to be fulfilled. In a number of instances, however, the inhabitants without asking for an enabling act have adopted a constitution and then applied for admission to the Union. As the language of the Constitution is not mandatory, but permissive, the question has arisen as to whether Congress in admitting new States may impose such conditions as it chooses, especially if such conditions were not imposed upon the original States. This was the main question in the Missouri Compromise (q.v.) controversy, since which time Congress has admitted many new States under conditions which were not imposed upon the old States.

After the Spanish-American War the exact status of Territories as compared with the national government and the rights and duties of the national government with regard to Territories again came into controversy. In 1901, however, in the Insular Cases, the United States Supreme Court decided that Congress may freely determine when new Territories are to be incorporated into the Union, can create such forms of government as it sees fit for regions outside the limits of the States, and legislate differently for different parts of the national domain.

TERROR, MOUNT. See **EREBUS AND TERROR**.

TERROR, REIGN OF. See **FRENCH REVOLUTION**.

TERRY, ALFRED HOWE (1827-90). An American soldier, born at Hartford, Conn. He studied at the Yale Law School, was admitted to the bar in 1849, and in 1854 was appointed Clerk of the Superior Court of Connecticut. He was a colonel in the State National Guard from

1854 until May, 1861, when he and his regiment entered the service of the Federal government. He participated in the first battle of Bull Run, was mustered out the following month, and in September reentered the service as colonel of the Seventh Connecticut Infantry. From that time until April, 1864, he was engaged in the military operations along the South Atlantic coast. He was promoted to the rank of brigadier general of volunteers in 1862, and in 1864 he was given command of the Tenth Corps of the Army of the James. In January, 1865, he commanded the second, and successful, Fort Fisher expedition. (See FORT FISHER.) Soon afterward he occupied the city of Wilmington, N. C., which had been the last refuge of the blockade runners. For his services he was commissioned major general of volunteers, and brigadier general and brevet major general in the regular army. From June, 1865, to August, 1866, he commanded the Department of Virginia. He was then placed in command of the Department of Dakota, and in 1876 he commanded the main column which drove Sitting Bull and his followers into Canada after the massacre on the Little Big Horn. Later he commanded the Department of the South and the Military Division of Missouri. He retired in 1888.

TERRY, BENJAMIN (1857-). An American historian, born at St. Paul, Minn. He graduated from Colgate University in 1878, studied at Hamilton and Rochester theological seminaries, and for several years was a Baptist minister. He was professor of history at Colgate from 1885 to 1892, when he received the degree of Ph.D. at Freiburg and accepted the chair of English history at the University of Chicago. His writings include: *A History of England from Earliest Times to Death of Victoria* (1901), a standard work; *A History of England for Schools* (1903); and articles in periodicals.

TERRY, CHARLES SANFORD (1864-). A British historian. He graduated at Clare College, Cambridge (B.A., 1886; M.A., 1890), and taught at several institutions successively, becoming lecturer in history at Aberdeen in 1898 and professor there in 1903. He published *Life and Campaigns of Alexander Leslie, First Earl of Leven* (1899); *The Rising of 1745* (1900; new ed., 1915); *The Chevalier de St. George* (1901); *The Cromwellian Union* (1902); *The Young Pretender* (1903); *John Graham of Claverhouse* (1905); *The Scottish Parliament* (1906); Craig's *De Unione* (1909), a translation, with notes; and *A Short History of Europe* (3 vols., 1911-15); and *German Sea Power and The Growth of Germany's Navy*, in "Oxford War Pamphlets" (1915).

TERRY, EDWARD O'CONNOR (1844-1912). An English comedian and manager. He was born in London, and began his career upon the stage in 1863 in Hampshire. In 1867 he made his appearance in London at the Surrey Theatre. Then followed successful engagements at the Strand (1869) and Gaiety (1876) theatres, among his characters being Paul Pry, Little Don Caesar de Bazan, and Bluebeard. In 1886 he presented at the Olympic Theatre his comedy of *The Churchwarden*. He opened Terry's Theatre in October, 1887, and there, a few months later, produced *Sweet Lavender*, himself playing Dick Phenyl; in this rôle he gave 670 performances. In 1892 he revived *The Magistrate*. In the season of 1897-98 he appeared in *The White Knight*.

Terry traveled all over the world. He was much interested in actors' benefit societies.

TERRY, ELLEN (ALICE) (1848-). An English actress. She was born at Coventry, daughter of Benjamin and Sarah Terry, actors whose talent was inherited by five children. Her first appearance on the stage was as the boy Mamillius in Charles Kean's revival of *A Winter's Tale*, at the Princess's Theatre in 1856. In March, 1863, Miss Terry made her appearance at the Haymarket in London, but after her marriage in 1864 to the painter G. F. Watts, she retired temporarily from the stage. She was later married to Charles Kelly, and in 1907 to James Carew, both actors. In 1875 she joined the Bancrofts at the Prince of Wales's Theatre, where she acted the part of Portia, and in 1876 she played at the Court with John Hare, in Lord Lytton's *The House of Darnley*. Early in 1878 she had a great success in Wills's *Olivia* at the Court. At the end of the same year she began her long association (24 years) with Henry (later Sir Henry) Irving (q.v.) at the Lyceum, as Ophelia to his Hamlet. Earlier, however, she had played with him in *The Taming of the Shrew*. Her most notable rôles during this period were: Portia in *The Merchant of Venice* (1879), probably the most famous of all; Camma in Tennyson's *The Cup* (1881); Juliet (1882); Viola in *Twelfth Night* (1884); Marguerite in *Faust* (1885); Fair Rosamond in Tennyson's *Becket* (1893); Madame Sans-Gêne in a Sardou adaptation (1897); and Clarissa in *Robespierre* (1899). Miss Terry's leading place among English actresses became undisputed. Her later rôles included: Mistress Page in *The Merry Wives of Windsor* (1902); Alice Grey in Barrie's *Alice Sit-by-the-Fire* (1905); Lady Cecily Waynelete in Shaw's *Captain Brassbound's Conversion* (1906); Hermione in *A Winter's Tale* (1906). At various times Miss Terry lectured on Shakespeare's heroines, with impersonations. In 1915, for this purpose, she visited the United States. Her first visit to America as an actress had been made with Irving in 1883, when she won a welcome that was repeated on eight subsequent occasions. A jubilee performance was held in her honor at Drury Lane, London, in June, 1906. In 1913 she published *The Russian Ballet*. Consult, first of all, Miss Terry's own *Story of my Life* (New York, 1908); also William Winter, *Shadows of the Stage* (ib., 1892); Hiatt, *Ellen Terry and her Impersonations* (London, 1898); Clement Scott, *The Drama of Yesterday and To-day* (ib., 1899); id., *Ellen Terry* (New York, 1900); T. E. Pemberton, *Ellen Terry and her Sisters* (ib., 1902). See TERRY, FRED; TERRY, PHYLLIS NEILSON; CRAIG, EDWARD GORDON.

TERRY, FRED (1863-). An English actor manager, brother of Ellen Terry. He was born in London, and married Julia Neilson (q.v.). His first stage appearance was at the Haymarket in 1880. During his career he played in all the principal cities of the United Kingdom, the United States, and Canada. For many years he was in the companies of noted actors. In 1900, with his wife, he assumed the management of the Haymarket, and in 1915 of the Strand. He played at the New Theatre, London, part of each year between 1905 and 1912. For his daughter, see TERRY, PHYLLIS NEILSON.

TERRY, MILTON SPENSER (1840-1914). An American Methodist Episcopal minister, educator, and author. He was born at Coeymans,

N. Y., and was educated at Troy University and at Yale Divinity School. Between 1863 and 1884 he was pastor of churches near New York City. He became professor of Christian doctrine in the Garrett Biblical Institute, Evanston, Ill., in 1885. He published, besides several Bible commentaries: *Biblical Hermeneutics* (1883); *Sibylline Oracles* (1890); *The New Apologetic* (1897); *Biblical Apocalyptics* (1898); *Moses and the Prophets* (1901); *The New and Living Way* (1902); *The Mediation of Jesus Christ* (1903); *The Primer of Christian Doctrines* (1906); *Biblical Dogmatics* (1907); *The Shinto Cult* (1910); *Baccalaureate Sermons and Addresses* (1914).

TERRY, PHYLLIS NEILSON (1892-). An English actress, daughter of Julia Neilson and Fred Terry (qq.v.). She was born in London, made her first stage appearance in *Henry of Navarre* (1909), and played Viola in *Twelfth Night* at the Haymarket in 1910. Subsequently she appeared in the leading rôles of other Shakespearean plays and in a revival of *London Assurance* (1913). She had great success in New York in 1915 in an all-star revival of *Trilby*, taking the title rôle.

TERSCHELLING, tər-skəl'ing. One of the West Friesian Islands, in the North Sea, belonging to the Province of North Holland, Netherlands (Map: Netherlands, D 1). Area, about 42 square miles. Pop., 1899, 3929; 1909, 4124.

TERSTEEGEN, tər'stā-gen, GERHARD (1697-1769). A German mystic, noted as a hymn writer. He was born at Mörs, was too poor to study theology, and thus remained a ribbon weaver till 1728, after which he devoted himself entirely to religious writing. After his conversion he practiced great self-denial in order to get means to help the poor. His religious ideas are like those of Angelus Silesius and Poiret, but the cast of his theology is Reformed. Besides his *Letters* (1773-75), he wrote *Geistliches Blumengürtlein* (1729; new ed., 1905); *Lebensbeschreibungen heiliger Seelen* (1733-53); and *Geistliche Brosamen* (1769-74). A collected edition of his writings appeared at Stuttgart (1844-45). Consult: Winkworth, *Christian Singers of Germany* (London, 1869); H. E. Govan, *Life of Gerhard Tersteege, with Selections from his Writings* (new ed., ib., 1902); John Julian, *Dictionary of Hymnology* (rev. ed., New York, 1907).

TERTIAN (těr'shan) **FEVER**. See **MALARIA**.

TERTIARY (Lat. *tertiarius*, one of the third rank, i.e., after the male and female members strictly belonging to an order, from *tertius*, third). A class in the Roman Catholic church, who, without entering into the seclusion of a monastery, aspire to practice as far as possible in ordinary life the counsels of perfection laid down in the gospel. It reached full development under the organizations founded by St. Francis and St. Dominic. The rules for tertiaries were made public in 1221. The intending members must restore ill-gotten goods, must renounce evil practices, and abandon feuds with their neighbors. Wives cannot be received without the consent of their husbands. The obligation of a tertiary, once accepted, is irrevocable, unless the party should be released, or should enter into a more strict religious life. The members are required to renounce luxury; they must frequent the sacraments; hear mass, if possible, daily; observe the fasts, as well as

certain special austerities; and cultivate charity towards all. None of these obligations were supposed to bind the members under pain of mortal sin. Consult Adderly and Marson, *Third Orders* (Oxford, 1902).

TERTIARY SYSTEM. A term applied in geology to the group of rocks included between the Cretaceous and Quaternary systems. It is one of the two periods constituting the Cenozoic era, the Quaternary being the other period. The term Tertiary was first suggested when it was considered that all strata were divisible into three groups, primary, secondary, and tertiary. The first two have been replaced in most localities by other names, but the third is still used, although not with its original significance. The Tertiary is one of the most interesting periods of geological history, presenting most complete sections and a great abundance of organic remains, and yet there has been much difficulty in classifying its different members correctly. The rocks are mostly unconsolidated and have rarely been laid down over great areas, so that in the United States, alone, there are no less than three or four separate regions of Tertiary rocks, in each of which a different series of subdivisions has to be adopted.

Following the European classification, the strata may be divided into four separate series—Eocene, Oligocene, Miocene, and Pliocene—in the order of their occurrence. These main series are recognized in all the Tertiary areas of the United States, of which there are four, viz., the Pacific coast, Western interior, Atlantic coast, and Gulf States. The section in the last-mentioned area is taken as the type.

At the end of the Cretaceous period a great topographic revolution took place in many parts of the world, and at that time the American continent had practically received its present form. The marine Tertiary deposits are found, therefore, chiefly along the borders of the continent, while the interior areas are of fresh-water formation, or perhaps in part æolian deposits. Many of the highest mountain ranges of the world, such as the Alps, Atlas, Caucasus, and Himalaya, were uplifted in the Tertiary period, their height being due to the fact that they are young geologically and consequently have not suffered greatly from erosive agencies.

The life of the Tertiary period presents many similarities to that of the present, although modern types had already begun to appear to some extent in the Cretaceous. In early Tertiary time the climate was very mild over the entire globe, and there was an abundant plant growth far to the north, plants being found in the rocks in many parts of Greenland. A gradual cooling of the climate followed, until at the end of the Tertiary there began the formation of the great continental glaciers that subsequently spread over so much of the temperate zone. The faunal changes that occurred during this period were in many respects remarkable. Of the smaller animals—the ammonites, belemnites, and other molluscan types that swarmed in the Cretaceous—few lived in the Tertiary. The great reptiles had also disappeared, but their place was taken by still more gigantic mammals. The fishes, amphibians, and birds closely resembled modern types.

The Tertiary deposits inclose a variety of economic minerals. In the Cordilleran region many of the metalliferous veins are probably of Tertiary age, as are also some of the bituminous

coals and lignites, in this same area, notably in Washington and Oregon. In the Tertiary beds of the Atlantic and Gulf States are many deposits of brick, pottery, and fire clays, while much of the green sand obtained in the Atlantic coastal plain region is of Tertiary age. In Texas deposits of limonite are known in this formation, while in Florida and South Carolina there are great supplies of rock phosphate. Petroleum and asphalt are obtained from the Tertiary deposits of southern California.

Dall, "A Table of North American Tertiary Horizons," in United States Geological Survey, *Eighteenth Annual Report*, part ii (Washington, 1898); Chamberlin and Salisbury, *Geology* (New York, 1907-09); Archibald Geikie, *Text-Book of Geology* (4th ed., 2 vols., ib., 1903). See EOCENE EPOCH; GEOLOGY; MIOCENE EPOCH; PALEONTOLOGY; PLIOCENE EPOCH.

TERTULLIAN (Lat. *Tertullianus*), **QUINTUS SEPTIMIUS FLORENS** (born before 160, died after 220). A Latin Church father, the creator of ecclesiastical Latin. He was born in Carthage, of heathen parentage, and trained for the profession of the law, which he practiced in Rome. Becoming a convert to Christianity about 197-198, he returned to Carthage, where he was made presbyter and spent the rest of his life. About the year 203 Tertullian became a Montanist, and left the Catholic church about 207. He was thenceforth unsparingly severe in his views of ecclesiastical discipline and in his judgments upon the alleged moral laxity of the "psychics," as he called the members of the Catholic church. No other figure in the early Church stands out so distinctly as does this Carthaginian lawyer priest. His intensity of character, alert intellect, blunt speech, keen satire, dialectical skill, moral strenuousness, and bitter partisanship, all combine to render him a marked personality. It was no doubt largely the result of his training that the expression of Tertullian's views was made in such a form as to imprint upon Western theology a legalistic character which it has never lost. He enjoys the further distinction of being the first to formulate in Latin the principles by which Catholic orthodoxy could infallibly be known. His *Prescription of Heretics*, for the clearness with which it enunciates these principles, has not improperly been described as a classic. Were it not for his Montanist errors, Tertullian would rank among the greatest of the Latin fathers. The time and circumstances of his death are unknown; there is no trace of him after about the year 220.

Among his many writings the best known is the *Apology*, written probably in 197. It is a vigorous vindication of the Christians against the attacks and false charges of the heathen world. His polemical zeal was further directed against Jews and heretics, e.g., in his *To the Nations*, *Against the Jews*, *Against Marcion*, *Against the Valentinians*, and *Against Praxeas*, the last named being especially valuable for the history of doctrine. He wrote many tracts on subjects connected with morals and church discipline, e.g., *On Baptism*, *Penance*, *Prayer*, *Patience*, *Idolatry*, and *Shows*. His characteristic strictness comes out even more strikingly in the works written after he became a Montanist, *Women's Apparel*, *The Veiling of Virgins*, *Monogamy*, *The Exhortation to Chastity*, and *Fasting*.

Bibliography. G. A. Simcox, *History of*

Latin Literature (2 vols., New York, 1883); C. T. Cruttwell, *Literary History of Early Christianity* (2 vols., ib., 1899); Teuffel-Schwabe, *History of Roman Literature*, translated by Warr (ib., 1900); P. Monceaux, *Histoire littéraire de l'Afrique chrétienne*, vol. i (Paris, 1901); Robert Rainy, *The Ancient Catholic Church* (New York, 1902); Williston Walker, *Great Men of the Christian Church* (Chicago, 1908). The *Works of Tertullian* are published in the *Corpus Scriptorum Ecclesiasticorum Latinorum*, vol. xx (ed. by Reifferscheid and Wissowa, Vienna, 1890; new ed. by A. Kroymann, Tübingen, 1907 et seq.); an English translation is in *The Ante-Nicene Library*, vols. iii and iv (American ed., New York, 1885 et seq.).

TERUEL, tã'roo-ãl'. The capital of the Province of Teruel, in Aragon, Spain, on the left bank of the Guadalaviar, 72 miles northwest of Valencia (Map: Spain, E 2). It is a quaint old town with a handsome Gothic cathedral, a great aqueduct, normal and primary schools, good hospitals and asylums, a library, and a meteorological station. Pop., 1900, 9538; 1910, 11,935.

TERU-TERU, tã'roo-tã'roo. A lapwing plover (*Vanellus cayenensis*) of the eastern part of South America, whose specific characteristics are the long crest and long blunt yellow spur; also its sharp repetitive cry copied in its local name. Its habits on the pampas, where in the breeding season it executes remarkable dances, are described at length by Hudson, who says the bird seems absolutely fearless of man at that period, dashing into his face until it becomes a nuisance. Consult Hudson, *Argentine Ornithology* (London, 1888).

TERZA RIMA, tã'tsã rã'mã (It., rhyme of three). An Italian verse form, of which the first and most notable use was made by Dante in the *Divina Commedia*. Each stanza consists of three hendecasyllabic lines with two rhymes; lines 1 and 3 repeat the middle rhyme of the preceding stanza, and thus the stanzas are closely interwoven. The series or canto necessarily begins and ends with an alternating couplet: a b a, b c b, c d c . . . y z y z. The end of a stanza tends to coincide with a pause in the thought. There is a prevailing inclination to seek the origin of the *terza rima* in the *serventese* (Provençal, *sirventès*). Dante may have invented it as a form symbolically adapted to his poem. Sir Thomas Wyatt, who was much under the influence of Italian models, introduced the stanza into English, choosing it for three satires. Sir Philip Sidney experimented with it in his *Arcadia*, and Milton tried it in a version of the second Psalm. There have been some attempts to preserve the original metre of the *Divina Commedia* in English translation, notably by Byron, who made a version of the Francesca episode in the *Inferno*. Byron's *Prophecy of Dante* is also written in *terza rima*. The exact replica of the Italian hendecasyllable *verso piano* (which ends with a "feminine" foot: —), such as that recently attempted by John Payne (*An English Dante*, New York, 1914), is singularly unadapted to the English language. The best English specimen of this difficult stanza is Shelley's *Ode to the West Wind*. Consult: H. Schuchardt, *Ritornell und Terzine* (Halle, 1875); G. Paris, in *Romania*, vol. iv (Paris, 1875); Cassini, *Sulle forme metriche italiane* (2d ed., Florence, 1890); Stengel, "Romanische Verslehre," in Groeber, *Grundriss der roman-*

schen Philologie, vol. ii, part i (Strassburg, 1893); and R. M. Alden, *English Verse* (New York, 1903).

TESCHEN, tĕsh'en (Pol. *Cieszyn*). A town of Silesia, Austria, 63 miles west-southwest of Cracow, on the right bank of the Olsa (Map: Austria, F 2). It was formerly the capital of the Duchy of Teschen. It has manufactories of modules, carriages, clocks, screws, and furniture. There are also breweries, distilleries, flax-spinning mills, and bookbinderies. Teschen is celebrated for the peace, May 13, 1799, which closed the War of the Bavarian Succession. Pop., 1900, 20,454; 1910, 22,540.

TESLA, NIKOLA (1857-). An American inventor and electrician, born at Smitjan, Lika, Austria-Hungary. His mother and mother's father were inventors. After studying engineering at the Polytechnic School at Graz and the exact sciences at the University of Prague he worked in the telegraphic engineering department of the Austrian government until 1881, when he became engineer to an electric company in Budapest. In 1884 he came to America, where he was naturalized and at first was employed in the Edison plant at Orange, N. J. Subsequently working at Pittsburgh and elsewhere, he devoted himself to experimental research and invention. He discovered the principle of the rotary magnetic field, applying it in a practical form to the induction motor. Tesla's discovery made possible the alternating current motor and the transmission of power by such current, employing what became known as 2-phase, 3-phase, multi-phase, and poly-phase systems, particularly on long-distance lines, later used extensively. His patents, which were the subject of litigation, were sustained in 1906. Tesla invented many electrical appliances, including dynamos, transformers, induction coils, oscillators, and arc and incandescent lamps, and is principally known for his researches in alternating currents of high frequency and high potential. Tesla's later work dealt with the application of such currents to wireless telegraphy, the transmission of power without wires, and many similar problems. Consult T. C. Martin, *The Inventions, Researches, and Writings of Nikola Tesla* (New York, 1894).

TESLA COIL. See INDUCTION COIL.

TESQUE. See TANOAN STOCK.

TESSIN, tĕs-sĕn'. The German name of the Swiss Canton of Ticino (q.v.).

TESSIN, tĕs-sĕn', CARL GUSTAF, COUNT (1695-1770). A Swedish statesman, born at Stockholm, son of Count Nicodemus Tessin (q.v.). At 30 he was Ambassador to Vienna. Appointed Prime Minister in 1738, he became spokesman for the "Hat" party. In 1739-42 he was Ambassador in Paris. Under Adolf Fredrik he exerted much influence as Premier, but because he opposed the extension of the King's power he had to resign from office (1752). Tessin was the foremost representative of French culture in Sweden, and one of the most brilliant personages of his time. His literary style is excellent and he was a fine orator. He wrote a daybook of 29 volumes, and *En gammal mans bref till en ung prins* (Stockholm, 1753; Eng. eds., 1755 and 1756).

TESSIN, NICODEMUS (1615-81). A Swedish architect, born at Stralsund. In 1646 he became royal architect and in 1674 he was knighted. Among the buildings he erected, many still standing, are: Skokloster, Ekolsund, Ströms-

holm, Drottningholm (completed by his son, see below), and Borgholm castles, Kalmar Cathedral, his principal work of the sort, and at Stockholm, St. Mary's Church, the Wrangel Palace, and Axel Oxenstierna Palace.

TESSIN, NICODEMUS, COUNT (1654-1728). A Swedish architect and statesman, born at Nyköping, son of Nicodemus Tessin (q.v.). He was educated at Stockholm and Upsala universities, then studied architecture under his father and for four years in Italy under Bernini and Fontana. He became royal architect in 1676. His most notable work, the present Royal Castle at Stockholm, begun in 1697 to replace the palace burned that year, was completed after his death. Tessin finished Drottningholm Castle and built the Auditorium Gustavianum at Upsala, Steninge Castle, his home, and various churches. Several foreign monarchs employed him, and he held various honorary offices. He is known as the most distinguished of Swedish architects.

TES'TA. The special protective coat of seeds, which is usually hard, but sometimes (as in certain gymnosperms) develops also a fleshy layer.

TESTA, GHERARDI DELLA. See GHERARDI DELLA TESTA.

TEST ACTS. Numerous acts of the English Parliament imposing religious tests upon persons in public office. The most famous are the Corporation Act of 1661 and the Test Act of 1673. The Corporation Act directed that all magistrates should take the oaths of allegiance and supremacy, as well as an oath renouncing the doctrine that it is lawful to take arms against the King, and provided that they must receive communion according to the rites of the Church of England. The Test Act, so called, imposed the like conditions on the holders of all public offices, civil and military, and obliged them in addition to abjure all belief in the doctrine of transubstantiation. Both of these acts were the result of the struggles against the Catholics in the reign of Charles II. They were repealed in 1828 as regards most of the provisions. See ENGLAND.

TESTAMENT (OF, Fr. *testament*, from Lat. *testamentum*, will, publication of a will, from *testari*, to make a will, attest, testify, from *testis*, witness). Literally, a calling upon witnesses. Technically, in Roman law, a will; an act by which a person determines what person or persons shall take his property after his death. The oldest form of testation at Rome was a declaration in the presence and with the sanction of the Roman people in assembly or meeting as an army on the eve of battle. Of the scope and effect of this form of testation little is known. It could, apparently, be employed by patricians only, and it probably affected only such property as did not form part of the household estate (*pecunia* as distinguished from *familia*). In any case, the later Roman testament was developed on a different and independent basis. It started as a sale (*mancipatio*) of the inheritance, and became a secret and revocable instrument, signed and sealed by the testator and seven witnesses. As this mancipation testament is the ancestor of the testament or will in all modern countries, its development is described under WILL.

TESTAMENT, INOFFICIOUS. See INOFFICIOUS TESTAMENT.

TESTAMENTARY, LETTERS. See LETTER.

TESTAMENT OF LOVE, THE. A prose work erroneously credited to Chaucer by Speght

in the 1598 edition. It was written about the close of the fourteenth century by a prisoner in peril of his life, and modeled on Boethius's *Consolation of Philosophy*, substituting for philosophy Divine Love.

TESTAMENTUM PORCELLI (Lat., Last Will of a Little Pig). An amusing Latin skit parodying the legal testamentary forms. It is of unknown authorship, and was written before the fourth century A.D. According to St. Jerome it was a favorite recitation by schoolboys. The text is in Bücheler's smaller edition of Petronius (Berlin, 1886), and is edited with English notes in Peck and Arrowsmith's *Roman Life in Latin Prose and Verse* (New York, 1894).

TESTICARDINES. See BRACHIOPODA.

TESTIMONY (from Lat. *testimonium*, testimony, from *testis*, a witness). The oral evidence given in a judicial proceeding. This may be adduced either on the trial of an action in court or before an authorized investigation of a committee or commission. The term is popularly used as synonymous with evidence. The latter is an inclusive term. A document is marked in evidence, but the relevant or competent statement of a witness on the stand is testimony. The usual course of the proceedings consists of the direct examination by the producing counsel and subsequent cross-examination by the opposing counsel, and then, if necessary, redirect examination. See EVIDENCE. Consult F. Wellman, *Art of Cross-Examination* (New York, 1903), and F. Wrottesley, *Examination of Witnesses in Court* (rev. ed., London, 1910).

TESTIMONY, ARK OF. See ARK OF THE COVENANT.

TESTIMONY, PSYCHOLOGY OF. There are three groups of problems in applied psychology (see PSYCHOLOGY, APPLIED) which have a bearing upon the nature and weight of certain forms of evidence in legal practice: the report of the witness, the possibility of discovering hidden emotional and ideational complexes from which it may be inferred whether the accused is withholding important facts, and the mental status of the witness or the accused.

Judges and advocates of the courts have long known that a conflict of evidence, in cases where the perceptions and memories of witnesses are concerned, need not mean dishonesty. Experimental psychology has shown that such individual differences must be expected. It remains for applied psychology to determine the variation in range and accuracy of report; the effect of suggestion by way of leading questions; and the degree of accuracy with which an event may be reconstructed from conflicting accounts. The general method employed is to present a group of objects, a picture, or an enacted scene, and after an interval to request the observers to give an account, either by narrative or in response to questions, of what they saw. The results, which are not to be regarded as final, are as follows: errorless reports are the exception (about 2 per cent); the narrative form gives a larger coefficient of accuracy than the interrogatory (90 per cent as against 75 per cent); the range of the latter is much larger (65 per cent as against 40 per cent); as the time interval between presentation and report increases, there is a fairly constant (though slight) decrease both in range and accuracy; children are more suggestible than adults, and their reports are more inaccurate and of less range; both

range and accuracy increase with practice; an experienced interpreter can construct an account, from a number of conflicting reports, with an error of less than 1 per cent.

For attack upon the second problem, a method has been devised which takes advantage of the reaction experiment (see REACTION) and the laws of association of ideas (q.v.). The suspect is told that he will be given a word, and that he must reply with the first word that comes to mind. Both the reaction word and the reaction time are recorded. A list of words previously prepared by the experimenter contains critical words, i.e., words that will probably associate to some phase of the crime. The reactor may now betray himself either by the nature of his verbal reaction to a critical word or, in case there is an inhibition, by the increased length of his reaction time. The experiment has proved successful in many instances, and in others it has failed: much work is yet necessary before all the conditions can be brought under control.

Finally, for obvious reasons, it is desirable to know whether a witness or an accused is of normal mind, or is insane, defective, hysterical, etc. Mental tests (q.v.) are employed for this determination; and, so far as regards mental defectives, with good success. A closely related problem, and one that has important psychological bearings, is the prevention of crime. Consult: L. W. Stern, *Beiträge zur Psychologie der Aussage* (Leipzig, 1903-06); Hugo Münsterberg, *On the Witness Stand* (New York, 1908); G. M. Whipple, "The Observer as Reporter," in *Psychological Bulletin*, vol. vi (Baltimore, 1909); C. J. Jung, "The Association Method," in *American Journal of Psychology*, xxi (Worcester, 1910); H. Gross, *Criminal Psychology* (Boston, 1911); O. Lipmann, *Die Spuren interessebetonter Erlebnisse u. ihre Symptome* (Leipzig, 1911); Hugo Münsterberg, *Psychology, General and Applied* (New York, 1914). See CRIMINOLOGY.

TESTING MACHINE. A machine employed for testing and determining the strength of materials used in construction and engineering works. In order to determine the strength of a given material such as the iron or steel used in a boiler or engine, the wood of a building, or brick, stone, cement, etc., it is usual to select small samples and submit them to stresses of varying degrees, from which the characteristics of the material may be learned and various numerical values obtained. With the use of iron and steel in building construction it is found desirable to test beams, columns, and other forms on a large scale often to failure or destruction. Testing machines may depend upon the action of an hydraulic press or of a system of screws and gears by means of which the known force applied can be greatly multiplied by the time it is directly exerted on the piece under test. For many years the testing machine at the Watertown (Mass.) Arsenal enjoyed a unique distinction. Large testing machines are now installed at the laboratories of the United States Bureau of Standards at Washington and Pittsburgh. At Washington there are two machines of the Emery type with capacities of 2,300,000 pounds and 230,000 pounds respectively, while at the Pittsburgh laboratory there is a 10,000,000 pound Olsen testing machine with which tests of full-sized concrete and brick columns have been made. The Riehle testing machine in smaller sizes is extensively used for structural materials, while for paper, textiles,

and other substances special machines and methods are employed. The various tests will be found discussed under STRENGTH OF MATERIALS. Consult publications of the American Society for Testing Materials and of the United States Bureau of Standards.

TESTRY, tēs'trē'. A village of France, between Péronne and Saint-Quentin, in the Department of Somme, noted as the scene of a battle (687) in which Pepin of Heristal, the Austrasian Mayor of the Palace, defeated the forces of Neustria and Burgundy, thus bringing the three Frankish kingdoms under his power. See FRANKS.

TESTS, MENTAL. See MENTAL TESTS.

TESTU'DINA'TA. The reptilian order Chelonina (q.v.).

TESTUDO (Lat., tortoise). A device of Roman warfare, by means of which a body of men advanced for assault. The attackers would move in close order, with shields held above their heads, edges overlapping. The effect resembled the shell of a tortoise (*testudo*), and proved an effective protection from weapons of the defenders. A later improvement was the *testudo* machine (on wheels and roofed over), under the protection of which soldiers could destroy or undermine defensive walls. A modified form of the same principle is seen in the flying sap.

TET'ANUS (Lat., from Gk. *tetanós*, spasm, tension, from *teinein*, *teinein*, to stretch, strain), or LOCKJAW. An infectious disease characterized by tonic spasms of the voluntary muscles, with marked exacerbations. The contractions may be confined to the muscles of the lower jaw (trismus), to certain other groups of muscles, or involve all the muscles of the body. The disease is dependent on a bacillus, discovered by Nicolaier in 1884, and cultivated by Kitasato in 1889. The bacillus is a slender rod, with one rounded end containing a spore, and exists in the feces of the herbivora and man, and under favorable conditions the spores remain virulent for years. It is found especially in well-manured soil and in dust and surface soil. This accounts for the fact that wounds infected by dust are often followed by tetanus. The organism gains entrance to the tissues often through wounds so slight as to be overlooked. The disease may follow surgical operations or childbirth, infecting the mother through the parturient canal and the child through the cut umbilical cord (trismus nascentium, q.v.). Vaccination wounds are sometimes the port of entry for the bacillus. The microorganism is anaerobic, i.e., it flourishes only in the absence of air or oxygen.

After an injury the disease sets in usually within ten days. Without warning the patient feels a stiffness at the back of the neck, and then in the jaws, so that he is unable to open his mouth widely or to masticate properly. These symptoms continue for a day or two, or the patient may rapidly come to the stage of general rigidity, in which the muscles of the trunk and extremities are affected. The back becomes rigid and arched (opisthotonus); the muscles of the abdomen become hard and board-like; respiratory movements are limited by the rigid muscles. By this time the jaw is firmly closed by contraction of the masseter muscles, and the other muscles of the face drawn into the painful smile known as the *risus sardonius*. At this stage violent convulsions of the hitherto

rigid muscles supervene. During a paroxysm the patient's teeth are tightly clenched, while breathing is in temporary suspension, with imminent danger of death. The spasms are intensely painful, and occur at first at intervals of half an hour or more with gradually increasing frequency. Muscular contractions are sometimes so forcible as to rupture a muscle or break a bone. In untreated cases the end comes in a few days; the paroxysms being more violent and frequent and death ensuing from exhaustion, fixation of the respiratory muscles, or glottal spasm. There may be little fever during the attack, but before death an extraordinary rise in temperature may take place.

The preventive treatment of tetanus is most important. Wounds likely to be contaminated with earth should be opened freely, disinfected thoroughly, with tincture of iodine preferably, and well drained; and a dose of antitetanic serum administered. When these precautions have not been taken and lockjaw sets in, the serum should be promptly injected either into the muscles or spinal canal. Intraspinal injections of magnesium sulphate have cured some patients. Drugs may be given to control the spasms, the most useful of which are chloral hydrate, hyosine, the bromides, and calabar bean. Chloroform may be necessary during the worst convulsions.

A great many cases of infantile tetanus can be prevented by antiseptic treatment of the stump of the umbilical cord. Tetanus in infants (tetanus neonatorum) is very fatal, being uninfluenced even by antitoxin. Consult article by J. M. Anders in William Osler, *Modern Medicine* (New York, 1915). See TRISMUS NASCENTIUM.

TETANUS, IN ANIMALS. The disease due to the action of *Bacillus tetani* attacks domestic animals, most frequently horses and sheep. It is an acute infectious disease due to an intoxication of the nervous system, characterized by persisting spasmodic contractions of the entire body musculature or of single groups of muscles, without impairment of consciousness. In an acute attack the animal usually dies within four days. The symptoms usually come on gradually, involving most of the muscular structures, which become hard and rigid. The nose is protruded, the limbs move stiffly, the tail is upraised, the bowels are constipated. The sufferer must be kept perfectly quiet, in an airy but comfortably warm place, and plentifully supplied with cold water, and soft, sloppy, but nutritious food, to be sucked in through the firmly closed teeth. In treating the disease it is essential that the seat of infection be thoroughly disinfected at once. The administration of drugs by mouth is dangerous and should not be attempted. The antitetanic serum has given only indifferent results in affected animals, but may be beneficial if administered at the onset of the disease in relatively high doses. Successful results have been reported to follow subcutaneous injection of carbolic acid and the injection of a solution of magnesium sulphate. Horses which receive wounds or upon which surgical operations are performed—in districts where tetanus frequently occurs—may receive a very high degree of protection through the administration of a dose of tetanus antitoxin. Consult: Leonard Pearson and others, *Special Report on Diseases of the Horse*, published by the United States Bureau of Animal Industry (Washington,

1911), and Hutyrá and Marek, *Special Pathology and Therapeutics of the Diseases of Domestic Animals* (Amer. ed. from 3d Ger. ed. by Mohler and Eichhorn, Chicago, 1912).

TET'ANY. A form of tonic muscular spasm, affecting especially the muscles of the extremities, most frequently observed during infancy, although it may occur at any age. The principal exciting cause is gastrointestinal irritation, teething, worms, etc., and the disease is commonly associated with rickets (q.v.). During an attack the legs and arms are bent and rigid, the hands, feet, and fingers are tightly flexed. The attack may last only a few minutes, or may be prolonged over hours or days. There is no fever, nor loss of consciousness, and the disease is in itself rarely fatal; the prognosis depending on the associated disorder, to which treatment should be addressed.

TÊTE DE PONT, *tât de pôñ* (Fr., bridgehead). In modern fortifications a group of works intended to cover one or more bridges, whether permanent or military, so as to prevent the crossing of the enemy, or to enable troops to cross over to the enemy bank, or to permit them to retreat to their own bank. The nature of the works constituting the bridgehead will vary according to the objective. They may be situated two miles or more from the stream whose crossing is in question, with the flanks resting on the river and securely guarded. In other words, a bridgehead under modern conditions is a fortified position rather than a single work. See FORTIFICATION.

TETERNIKOV, FEODOR. See SOLOGUB, FEODOR.

TE'THYS (Lat., from Gk. Τηθύς). In Greek mythology, daughter of Uranus and Gæa, and, by Oceanus, mother of the Oceanids and the river gods.

TET'RABRAN'CHIA'TA. See ЦЕРПЯЛОПОДА.

TET'RACHORD (from Gk. τετράχορδος, *tetrachordos*, having four strings, from *térpa-*, *tetra-*, four + *χορδή*, *chorde*, string, cord). In music, a system of four tones comprised within the compass of a perfect fourth. The Greek scales were composed by joining two tetrachords. In the Middle Ages the tetrachord was superseded by the hexachord, introduced by Guido d'Arezzo. See GREEK MUSIC.

TET'RAD. See BACTERIA.

TETRAD'YMITÉ (from Gk. τετραδύμος, *tetradymos*, fourfold, from *térpa-*, *tetra-*, four; so called from its frequent occurrence in twin crystals). A mineral bismuth telluride frequently containing sulphur and selenium. It is crystallized in the hexagonal system, has a metallic lustre, and is of a steel-gray color. It is found in Norway, Sweden, and in the United States at various localities in Virginia and North Carolina.

TETRAGONAL SYSTEM. See CRYSTALLOGRAPHY, and Plate of CRYSTAL FORMS.

TET'RAGRAM'MATON (Gk. τετραγράμματον, word of four letters, neut. sing. of *τετραγράμματος*, *tetragrammatos*, having four letters, from *térpa-*, *tetra-*, four + *γράμμα*, *gramma*, letter, from *γράφειν*, *graphein*, to write). A term used to designate the name of Israel's God, consisting of the four letters YHWH. In the Masoretic text it occurs 6823 times and is written with the vowels of Adonai, Lord (originally my Lord), or with those of Elohim, God. By these vowels the reader was warned not to pronounce the divine name, but to substitute for it Adonai or

Elohim. On the reasons for this custom, see JEHOVAH. The Greek version (see BIBLE) uses Κύριος, *Kyrios*, Lord, for the tetragrammaton. The editorial revision of Book II in the Psalter (Psalms xlii-lxxii) also substitutes for it Elohim. There is little room for doubt that the original pronunciation was Yahwe, the final *h* being inaudible. According to Theodoret the Samaritans (q.v.) pronounced the name *IaBé*, *Yabe*, or *Yave*, and this statement is borne out by extant Samaritan hymns where the rhyme indicates that pronunciation, and by direct testimony. The same pronunciation is ascribed to a Christian sect by Epiphanius and is found in Egyptian papyri. An Ethiopic manuscript gives the form Yawe, in which the vowels are indicated. The name *Iao* frequently found in manuscripts and papyri goes back to Yahu. That Yahu or Yah existed in Syria as a divine name before the Hebrew invasion is probable and receives some support from Egyptian and Babylonian inscriptions. The fact that Yah occurs chiefly in late Old Testament writings may be due to an archaistic tendency not seldom seen in connection with the liturgy. Yah at the end of a name and Yeho at the beginning meet us so often in preëxilic times that it is likely to be very old. It is also significant that Yahwe never seems to be used in theophorous names. Since it was at all times permitted to pronounce Yahu, it is not strange that the Greeks and Romans should have got the impression that the name of the god of the Jews was *Iao*. The earliest datable occurrence of the tetragrammaton is in the inscription of King Mesha of Moab, c.840 B.C. Through the Samaritans and certain Jewish sects the knowledge of the proper pronunciation was perpetuated. While the Samaritans of the seventeenth century refused to divulge this secret, Sabbatai Zewi (see MESSIAH), the famous mystic and claimant to the Messiahship, insisted upon the pronunciation of the tetragrammaton. See JEHOVAH, and consult the works referred to in that article.

TET'RAHE'DRITE (from *tetrahedron*, so called from the prevailing forms of its crystals). A sulphantimonite of copper, crystallizing in the isometric system, and often occurring in massive forms. It is commonly associated with chalcopyrite (q.v.), massive varieties frequently forming intimate mechanical mixtures; it is also associated with other mechanical sulphides. Tetrahedrite is universally distributed and constitutes an important ore of copper (q.v.).

TET'RAHE'DRON (from Gk. *térpa-*, *tetra-*, four + *ἔδρα*, *hedra*, base). A solid bounded by four planes. It appears in nature, and as a crystal is classified as a secondary form of the octahedron, produced by removing the alternate angles or edges of the latter. See POLYHEDRON.

TETRAI'OGY (from Gk. τετραλογία, *tetralogia*, group of four dramas, from *térpa-*, *tetra-*, four + *λόγος*, *logos*, word). (1) In Greek drama, a series of three tragedies and a satyric drama presented in sequence. The satyric drama was in some cases connected with the tragedies in subject, but its main purpose was to relieve the tension caused by the trilogy. (2) A musical drama in four parts. Wagner's famous tetralogy, *Der Ring des Nibelungen*, consists of *Das Rheingold*, *Die Walküre*, *Siegfried*, and *Götterdämmerung*. See TRILOGY.

TETRAM'ETER. See VERSIFICATION.

TET'RAPOLITAN CONFESSION. See SACRAMENTARIANS.

TE'TRARCH (Lat. *tetrarches*, from Gk. *τετράρχης*, governor of a fourth of a country, from *τέτρα-*, *tetra-*, four, fourth + *ἀρχεῖν*, *archein*, to rule). Originally, the governor of one of four divisions of a kingdom or country; e.g., of Thessaly, according to the arrangements of King Philip, father of Alexander the Great, and of Galatia (q.v.) before it was conquered by the Romans; but, in the usage of the later Roman Empire, any minor ruler, especially in the East, possessing sovereign rights within his territory, but dependent on, and in many cases removable at the pleasure of, the Emperor. This was especially the case in Syria, where the princes of the family of Herod are called indiscriminately by this title (Luke iii. 1) and by that of King (Matt. xiv. 9).

TETRAZZINI, tět'rā-tsə'ně, LUISA (1874-). An Italian coloratura soprano, born at Florence. Before she was 12 years old she sang without having received instruction, and knew perfectly a number of operas which she had heard her elder sister Eva (later the wife of Cleofonte Campanini (q.v.) practice. After only three months' regular study under Ceccherini at the Liceo Musicale of Florence she made her début as Inez in *L'Africaine* (1895), and then sang in Rome and other Italian cities. Her successes in Russia and Spain secured an engagement for Buenos Aires. From there she went through Mexico to California, whence her fame as a second Patti began to spread (1906). The next year she made a sensation at Covent Garden, and in 1908 Oscar Hammerstein (q.v.) engaged her for his Manhattan Opera House in New York. Subsequently she appeared as guest with the Metropolitan, Boston, and Chicago companies, and also made several triumphant concert tours. A voice of wonderful purity, power, and charm, combined with a faultless technical execution of the most florid and difficult passages, made her indeed the legitimate successor to Patti.

TET'RONAL (C₂H₅)₂C(SO₂C₂H₅)₂. A white, crystalline substance similar to sulphonal and, like the latter, used medicinally as an hypnotic. It melts at 85° C. (185° F.) and is but slightly soluble in water. See SULPHONAL; TRIONAL.

TETSCHEN, těch'en. A town of Bohemia, situated on the right bank of the Elbe, near the Saxon frontier. An active industrial place, having a number of factories and carrying on a lively trade, it is the emporium for the shipping traffic on the Elbe, and forms with Bodenbach practically one town. They are connected by three bridges. The handsome château of Count Thun, built in 1667-73, with a fine park, garden, and hothouses, library, and collection of coins and weapons, was once fortified and a place of some importance in the Seven Years' War. Pop., 1900, 9698; 1910, 10,641.

TETTENBORN, tět'en-börn, FRIEDRICH KARL, BARON (1778-1845). A German soldier, born in the Principality of Sponheim. He entered the Austrian army in 1794, serving in the wars of the French Revolution. At the battle of Wagram, in 1809, he won distinction by his bravery. Just before the invasion of Russia by Napoleon in 1812 he entered the Russian army as a lieutenant colonel, commanded Kutusoff's vanguard, and greatly harassed the French on their retreat. In 1813 he entered Berlin, together with the Russians, and thence proceeded to Hamburg, which he occupied, but whence he was driven May 30. He next fought against Davout and

Pecheux and captured Bremen October 15. He served with Bernadotte in Jutland and on the Rhine in 1814. In France, during the invasion of the allies, he did excellent service in keeping open communications. In 1818 he entered the service of Baden, and in 1819 was promoted to be lieutenant general, and was sent as Ambassador to Vienna, where he died.

TETUAN, tět-wān'. A town of Morocco about 38 miles southeast of Tangier, on the Martil. It lies in the midst of fine gardens and is surrounded by dilapidated walls. In the background loom the Rif Mountains. The rows of white houses rise in terraces. The streets are narrow and dirty, but there are many fine residences built by the Moors expelled from Spain. Gun barrels, coarse woolen cloth, slippers, and sashes are manufactured. Grain, fruits, wool, silk, leather, and beef cattle are exported, mainly to Gibraltar. The port, fortified by two forts, is one mile below the town at the mouth of the Martil, and is the only open Mediterranean port in the country. Population, about 25,000, of which 6000 are Jews. Tetuan was the centre of operations in the Spanish-Moroccan War of 1859-60. The city was abandoned by the Spanish in 1862.

TET'ZEL, JOHANN (c.1460-1519). A German Dominican, famous for his connection with the Reformation through Luther's attacks on his sale of indulgences. He was born at Pirna, in Saxony, and educated at the University of Leipzig, where he graduated in 1487, soon afterward entering the Dominican Order. Being a popular and effective preacher, he was intrusted with the proclamation of an indulgence, first on behalf of the Teutonic Knights from 1503 to 1510, and from 1516 as a subordinate of Albert of Brandenburg, Archbishop of Mainz, on the occasion of the indulgence in favor of contributors to the building of St. Peter's at Rome. In opposition to the preaching of Tetzel Martin Luther published his celebrated theses, on Oct. 31, 1517. Tetzel published a series of counter theses in the following January, and in April a reply to Luther's celebrated sermon on indulgences. In January, 1519, he was called upon to appear before the papal legate Von Miltitz to answer charges made against him, and was severely rebuked for unguarded language and improprieties in procedure. Consult: K. W. Kayser, *Geschichtsquellen über Tetzel* (Annaberg, 1877); Hermann, *Johann Tetzel* (2d ed., Frankfurt, 1883); J. B. Röhm, *Zur Tetzel-Legende* (Hildesheim, 1890); N. Paulus, *Johann Tetzel der Ablassprediger* (Mayence, 1899); *Cambridge Modern History*, vol. ii (New York, 1904).

TEUBNER, toip'nēr, BENEDICTUS GOTTHELF (1784-1856). A German bookseller, printer, and publisher. He was born at Gross-Kraussnigk, and became a bookseller at Leipzig in 1811. His house soon grew to be one of the most important in Germany. In 1832 he founded a printing house in Dresden. The firm is best known for cheap, accurate, and scholarly editions of Greek and Latin classics, as well as for scientific publications, especially those of the Saxon Royal Academy.

TEU'CER (Lat., from Gk. *Τεύκρος*, *Teukros*). The name of two kings in Greek legend. The first seems merely an invented eponymous hero for the *Teucri*, traditionally the early inhabitants of the Trojan plain. He is not mentioned in the early epic, but later is called the son of the river god Scamander and a nymph of Mount

Ida. Another version brought him from Crete. It was said that he gave his daughter, Bateaia, in marriage to Dardanus (q.v.), who succeeded him as King. The other Teucer appears in the *Iliad*, and remained a popular figure of legend. He was the son of Telamon, King of Salamis, and Hesione, daughter of Laomedon, King of Troy. He accompanied his half brother Ajax the Greater (see AJAX) to Troy, where he was the best archer among the Greeks, but on his return his father would not allow him to land at Salamis because he had not avenged the death of his brother Ajax, and had not brought back Tecmessa and Eurysaces, her son by Ajax. Teucer sailed for Cyprus, where he founded another Salamis. Cf. Horace, *Carmina*, 1, 7.

TEUFELSBRÜCKE. See DEVIL'S BRIDGE.

TEUFELSDRÖCKH, toifels-drëk, HERR DI-OGENES. In Carlyle's *Sartor Resartus*, the eccentric German professor whose speculations on the philosophy of clothes form the vehicle for the satire of the work.

TEUFFEL, toifel, WILHELM SIGISMUND (1820-78). A German classical scholar, born at Ludwigsburg, Württemberg. He studied at Tübingen, where he became professor of classical philology in 1849. His principal work is the *Geschichte der römischen Litteratur* (Leipzig, 1870; 5th ed., 1890, translated into English by G. C. W. Warr, London, 1891-92; 6th ed., by W. Kroll, F. Skutsch, and others, vols. ii-iii, Leipzig, 1910-13). Teuffel also published *Studien und Charakteristiken zur griechischen und römischen, sowie zur deutschen, Litteraturgeschichte* (Leipzig, 1871; 3d ed., 1889), and *Lateinische Stilübungen*, besides editions of the *Persæ* of Æschylus and the *Clouds* of Aristophanes.

TEUTONES, tū'tō-nēz. A powerful tribe of Germany, dwelling at the mouth of the Elbe. About 120 B.C. the Teutones joined the Cimbri (q.v.) in their migration southward. In 104-102 they remained in Gaul. In 102 they were annihilated by Marius (q.v.) at Aquæ Sextiæ (Aix). See GERMANIA; TEUTONIC RACE. Consult: Clère, *La bataille d'Aix* (1906); K. Müllenhoff, *Deutsche Altertumskunde*, ii (2d ed., Berlin, 1906); L. Schmidt, *Allgemeine Geschichte der germanischen Völker* (1909).

TEUTONIC AND SCANDINAVIAN MYTHOLOGY. See SCANDINAVIAN AND TEUTONIC MYTHOLOGY.

TEUTONIC KNIGHTS (The Teutonic Knights of St. Mary's Hospital at Jerusalem). An order of knighthood which originated in a brotherhood formed by German knights in 1190 during the siege of Acre by the Crusaders and recognized by Pope Clement III in 1191. In 1198 this association was changed into an order of knighthood as a balance to the political influence of the Templars and Hospitalers. Hermann von Salza, grand master from 1210 to 1239, saw no future in Palestine, and the order engaged in the conquest of the heathen Prussians, inhabiting the Baltic regions to the northeast of Germany. After a fierce struggle of half a century they completed their subjugation in 1283. Christianity was planted with fire and sword, cities were founded, and the land was colonized by Germans. In 1237 the Teutonic Knights absorbed the order of the Brothers of the Sword, and so acquired Livonia and Kurland. They waged long wars with the Lithuanians for the possession of the territory in-

tervening between these regions and the Prussian country. Early in the fourteenth century they extended their dominion westward, making themselves masters of Danzig and Little Pomerania (Pomerellen). They became a great power and their State prospered, but the Knights themselves remained a ruling aristocracy, and were hated by the conquered natives and Germans alike. In 1410 the power of the Teutonic Knights sustained a great blow through their defeat in the battle of Tannenberg at the hands of the Poles and Lithuanians. In 1466 they were compelled in the Treaty of Thorn to cede West Prussia to Poland and to agree to hold East Prussia as a Polish fief. Half a century later the Knights of the Sword cut loose from the Teutonic Knights, whose dominion was now restricted to East Prussia. In 1525 the grand master, Albert of Brandenburg (q.v.), having embraced Protestantism, laid down his office and converted the State over which he ruled into the hereditary Duchy of Prussia, for which he did homage to the King of Poland. The order was composed of knights, priests, and servants. The rule followed was that of St. Augustine. The insignia were the white mantle and the black cross. After the secularization of the Prussian domain of the Teutonic Knights the order continued to exist in Germany, having numerous possessions, mostly of very small extent, scattered throughout the Empire. Its head resided at Mergentheim (now a town of Württemberg). The order was abolished by Napoleon in 1809, and its possessions were confiscated. It was revived as an Imperial Austrian order in 1834. Its head is an Austrian archduke. Consult: Johannes Voigt, *Geschichte des deutschen Ritterordens* (Berlin, 1857-59); Ernest Strehlke, *Tabulæ Ordinis Theutonicæ* (ib., 1869); Max Perlbach, *Die Statuten des deutschen Ordens* (Halle, 1890); Johann Loserth, *Geschichte des späteren Mittelalters* (Munich, 1903).

TEUTONIC LANGUAGES (Lat. *Teutonicus*, from *Teutoni*, *Teutones*, an ancient German tribe, connected with Goth. *þiuda*, AS. *þeod*, OHG. *diot*, Ir. *túath*, country, people), or GERMANIC LANGUAGES. The group of languages of the Indo-Germanic or Indo-European family (see INDO-GERMANIC LANGUAGES) spoken by the Teutonic or Germanic stock. (See TEUTONIC RACE.) It is divided into three main groups: East, North, and West. These three groups were offshoots of a common stock called primitive Teutonic or Germanic, distinguished from other branches of the Indo-Germanic family by the phenomenon of "sound shifting."

East Germanic. This division seems to be entitled to the collective name Vandal. The more prominent East German peoples were the Goths (q.v.), the Vandals (q.v.) (in the narrower sense), and the Burgundians. (See BURGUNDY.) Of the last-named only scanty linguistic remnants have survived, which are discussed by R. Kögel, in Haupt's *Zeitschrift für deutsches Altertum*, vol. xxxvii (Berlin). Of the language of the Vandals likewise little remains. The remnants of their dialect are treated by Wrede, *Ueber die Sprache der Vandalen* (Strassburg, 1886). The most important of the East Germanic peoples were the Goths. (See GOTHIC LANGUAGE.) The Gothic language perished with their empires, except that a last remnant of Goths found an oasis on the Rumanian coast of the Black Sea where the dialect became extinct in the ninth century, except

for the Krim or Crimean Gothic which continued to exist as late as the sixteenth century. Our knowledge of Gothic depends almost entirely upon the language of the Visigoths in the Roman provinces of Mœsia and Dacia (Bulgaria and Rumania), as written down by Ulfilas (q.v.). Here the Teutonic dialects assume for the first time literary form.

North Germanic. The four dialects of this group, Swedish, Danish, Norwegian, and Icelandic, show but slight traces of dialectic difference before the eleventh century, as is proved by the evidence of the Norse runes (q.v.). The Scandinavian languages after the eleventh century, however, are divided into East and West Scandinavian, or East and West (or Old) Norse. The eastern division consists of Swedish (including the dialect of the island of Gotland) and Danish; the western division of Norwegian and Icelandic.

West Germanic. Linguistically West Germanic is best divided into Anglo-Saxon or English, Frisian, Low German (Old Saxon), Franconian (or Frankish), and High German.

Anglo-Saxon or English.—There were three main divisions of Anglo-Saxon, the Northern, Midland, and Southern, or also known as Northumbrian, Mercian, and Wessex Anglo-Saxon in the narrower sense. Anglo-Saxon records, which begin with the eighth century, belong almost entirely to the dialect of Wessex. Modern English is properly derived from the dialect of the East Midland or East Mercian division, but as very little material of that dialect has been preserved, it is customary to connect English words with the dialect of Wessex. Northumbrian gave rise to the later Scottish dialect. English proper begins about 1100 when flexional terminations show signs of weakening. This is usually called the Old English period which ended about 1350, when began Middle English ending about 1460. The Modern English period, from the latter date on, is characterized by an almost complete loss of adjective and noun flexions and verb flexions in respect to persons and moods. See **ANGLO-SAXON LANGUAGE AND LITERATURE**; **ENGLISH LANGUAGE**.

Frisian.—Frisian is still spoken in Holland, but in general Low German has taken its place. Frisian had originally three dialects, West Frisian in northern Holland, East Frisian between the mouths of the Ems and Weser, and North Frisian northward of the mouth of the Elbe. Old Frisian and the Anglian dialect of Anglo-Saxon are closely related in grammar and vocabulary. See **FRISIAN LANGUAGE AND LITERATURE**.

Low German (Old Saxon).—Low German speech differs markedly from Anglo-Saxon. The Old Saxon dialects were to the south of the Frisian and east of the lower and middle Frankish, extending over an area roughly corresponding to modern Westphalia, Hanover to Schleswig-Holstein. In its modern continuation Old Saxon is Plattdeutsch. See **GERMAN LANGUAGE**; **PLATTDEUTSCH**.

Franconian.—The Franconian or Frankish dialects of the present day in Middle Germany (Middle or Rhenish Franconian, and South or Upper Franconian) differ but little from High German. (See **GERMAN LANGUAGE**.) The North Franconian, spoken in the Netherlands as late as the sixteenth century, is also called Old Low Franconian. It is continued to the present day in the Dutch of Holland, and in the Flemish of

Flanders in Belgium. See **DUTCH LANGUAGE**; **FLEMISH LANGUAGE AND LITERATURE**.

High German.—For the character of High German speech, see **GERMAN LANGUAGE**. The principal modern dialects of High German are the Alemannic, spoken in Alsace, the south of Baden, and parts of Switzerland; the Swabian of Württemberg and western Bavaria, and the Bavarian of Bavaria, parts of Tirol, Salzburg, Austria proper, North Styria, North Carinthia, and other districts of the Austrian Empire.

General Characteristics. The Teutonic languages have developed striking special characteristics which differentiate them from the remaining languages of the Indo-Germanic family. These concern vocalism, consonantism, declension, and conjugation. As regards vocalization the Teutonic treatment of ablaut (q.v.) is peculiar. In the common Indo-Germanic period ablaut was a purely phonetic phenomenon, but in the Teutonic languages, owing to the prevailing loss of the reduplication (q.v.) in the perfect of the verb, and the reduction or loss of endings, ablaut has been adapted to a quasi-grammatical property. Thus the changes of the root vowel in Greek *δέχομαι, δέδοκα, ἔδρακον*, are identical with those in German *werde, ward, geworden*, but in Greek the vocalic changes are not associated consciously with the changes of tense. On the other hand, in the German *ward* the vowel *a* carries the preterite sense of the verb. The prominence of the ablaut has also contributed to analogical spread, and a considerable degree of generalization which has resulted in the six so-called ablaut series comprising the majority of the so-called strong verbs. Some of the types of these series in Gothic are: *beita, bait, bitum*, to bite; *kiusa, kaus, kusum*, to choose; *binda, band, bundum*, to bind. The phenomenon known as umlaut (q.v.), i.e., the assimilation of a given vowel to the vowel of a neighboring syllable, although it rests upon a universal phonetic tendency, is also specially prominent in all periods of the history of Teutonic speech.

Very characteristic is the treatment of the Indo-Germanic lingual and nasal vowels in all Teutonic languages, as *u* + lingual or nasal, giving the groups *ur, ul, um*, and *un*; e.g., Indo-Germanic **ulgos*, Skt. *vṛka*, wolf, appears in Gothic as *wulf*; and Indo-Germanic **kmtom*, Skt. *śatam*, hundred, appears in Gothic as *hund*.

The most characteristic of all Teutonic phenomena is the so-called shift or rotation of consonants, known as Grimm's law (q.v.). A group of apparent exceptions to Grimm's law was explained by Karl Verner. See **VERNER'S LAW**.

In the domain of noun declension the most important Teutonic phenomenon is the spread of the *n* stems, giving rise to the important distinction between the weak declension (*n* declension) and the strong declension (declensions without *n*). Especially, every adjective may be inflected according to the weak or *n* declension, being then used as the so-called definite form of the adjective in connection with the definite article, in distinction from the indefinite adjective with the indefinite article. The starting point for this is prehistoric. Already in Indo-Germanic times adjectives were substantivized by transition to the *n* declension. A parallel to the double adjective is found in the Balto-Slavic languages, which have produced a definite adjective by compounding the indefinite with the pronominal stem *jo-*.

The most important feature of the Teutonic languages in the field of conjugation is the distinction between strong and weak verbs, based in the main upon the different treatment of the perfect. The strong verbs were originally primary; they employed the nonthematic, and very largely reduplicated, perfect of Indo-Germanic times; as Gothic present *waitþa*, I become, perfect *warþ*. The weak verbs were mostly secondary or denominative present stems, which supplied their perfect by a periphrastic form made by fusion of the verb stem with a preterite form of the root *dhe*, to set, as Gothic present *nasja*, I save, perfect *nasida*. Especially in the later periods of Teutonic speech the historical limits of the two classes are effaced. The old type of preterite presents, which are presents in function, also associate with themselves the weak perfect, so that German *wciss*, know (Gothic *wait*, Greek *oida*), forms the weak perfect *wusste*, knew.

Grimm, *Deutsche Grammatik* (new ed., Berlin, 1870-97); Streitberg, *Urgermanische Grammatik* (Heidelberg, 1896); Dieter, *Laut- und Formenlehre der altgermanischen Dialekte* (Leipzig, 1900); Paul, *Grundriss der germanischen Philologie*, vols. i-v (3d ed., Strassburg, 1911-13); Loewe, *Germanische Sprachwissenschaft* (Leipzig, 1905); Hoops, *Reallexikon der germanischen Altertumskunde* (2 vols., Strassburg, 1911-15); Kluge, *Urgermanisch* (3d ed., ib., 1913); Kossinna, *Die deutsche Vorgeschichte* (2d ed., Würzburg, 1914); Kluge, *Etymologisches Wörterbuch der deutschen Sprache* (8th ed., Strassburg, 1915). See also the articles on the various languages of the Teutonic group and the bibliographies there given.

TEUTONIC ORDER. See **TEUTONIC KNIGHTS**.

TEUTONIC RACE. The name popularly applied to a division of the European peoples, comprising nearly the whole of the population of the German Empire, the Scandinavian countries, the Netherlands, Great Britain, and Switzerland; a large proportion of the people in the United States, Canada, Newfoundland, Australia, New Zealand, and Cape Province; about two-thirds of the inhabitants of Cisleithan Austria; and half the population of Belgium (Flemings). It is also represented by large numbers in Hungary and in the Baltic provinces, Finland, and other parts of Russia, and is found scattered over the whole world. See **EUROPE, PEOPLES OF**.

TEUTSCHENBRUNN, JOHN HEUMANN VON. See **HEUMANN VON TEUTSCHENBRUNN**.

TEWERONE, tā'vá-rō'ná. See **ANIO**.

TEWA, tā'vá. A group of Tanoan-speaking pueblos in New Mexico. See **TANOAN STOCK**.

TEWFIK (MOHAMMED) **PASHA**, tā'fík pá-shá' (1852-92). Khedive of Egypt from 1879 to 1892. He was the eldest son of Ismail Pasha, who secured from the Sultan a firman decreeing the khedival succession to Tewfik instead of his brother Halim. In February, 1879, when the ministry of Nubar Pasha was dismissed (see **EGYPT**), Prince Tewfik became president of the Council, but he, like Nubar, showed too much sympathy with Egypt's European creditors and soon retired. On June 26, 1879, the Sultan deposed Ismail and Tewfik became Khedive, at a time when Egypt was deeply embarrassed financially and the power of the Khedive was much curtailed. His general policy was modern and European, and the year 1880 wit-

nessed the establishment of the dual control of Egypt by England and France. Tewfik soon had to face the rebellion of the Nationalists under Arabi Pasha (q.v.), and Egypt was rescued from anarchy by the intervention of England, which thereby established a controlling influence in the country. Consult F. C. Penfield, *Present Day Egypt* (rev. ed., New York, 1903).

TEWKESBURY, tûks'bér-i. A town and parliamentary and municipal borough in Gloucestershire, England, on the Avon, 10 miles northeast of Gloucester (Map: England, D 5). The parish church, an ancient and noble Norman edifice, is a noteworthy architectural feature, and is all that remains of a great Benedictine abbey founded in the twelfth century. Tewkesbury is famous as the scene of the battle fought within half a mile of it on May 4, 1471, when the Yorkists under Edward IV and the Duke of Gloucester inflicted a signal defeat on the Lancastrians. Pop., 1901, 5419; 1911, 5260. Consult Blunt, *History of Tewkesbury* (2d ed., London, 1877), and Massé, *Tewkesbury Abbey Church* (ib., 1900).

TEWKSBURY. A town in Middlesex Co., Mass., 5 miles southeast of Lowell, on the Boston and Maine Railroad (Map: Massachusetts, E 2). It contains the State infirmary. There are extensive horticultural interests, and a chemical factory. Pop., 1900, 3683; 1910, 3750; 1915 (State census), 5265.

TEXARKANA, tēks'ir-kān'á. The name of two adjoining cities situated on each side of the boundary between Arkansas and Texas, 145 miles southwest of Little Rock; on the Texas and Pacific, the St. Louis, Iron Mountain and Southern, the Memphis, Dallas, and Gulf, the St. Louis Southwestern, and the Kansas City Southern railroads (Map: Texas, E 3). One of the municipalities is the county seat of Miller Co., Ark., and the other is in Bowie Co., Tex. They form, however, practically one industrial community. There are two Federal courts, a county court, two hospitals, a fine post-office building, two city halls, and St. Agnes Academy, besides several handsome residences and business blocks. Texarkana has considerable importance in commerce and manufactures. It is the centre of large timber interests, and ships also cotton, cottonseed oil, and hides. Foundries and machine shops, various plants connected with the cotton industry, large creosoted timber and glass plants, railway shops, cooperages, lumber mills, and furniture, casket, candy, screen, sulphur, mattress, and pottery factories constitute the leading industrial establishments. Pop., Texarkana in Texas, 1900, 5256; 1910, 9790; 1915, 12,181; 1920, 11,480. Texarkana in Arkansas, 1900, 4914; 1910, 5655.

TEX'AS. A state in the south-central part of the United States, popularly called the Lone Star State. It is, next to Florida, the southernmost State of the Union, lying between latitudes 25° 51' and 36° 30' N., and between longitudes 93° 27' and 106° 43' W. It is of an irregular triangular shape with the apex pointing south and a square panhandle extending northward. Its greatest length from north to south is about 800 miles, and its greatest breadth about 750 miles. It is the largest State in the Union, having an area of 265,896 square miles, of which 3498 square miles constitute water surface. Its area is larger than the combined area of the Atlantic States from Maine to Virginia, inclusive.

Topography. In general the land rises gradually towards the west boundary by a succession of broad and more or less terraced slopes running parallel with the Gulf coast. Five or six well-marked topographical regions may be distinguished. The first is the coastal plain, a continuation of the same formation in the other Gulf States. It rises gradually from sea level to an altitude of 500 feet about 150 miles inland, and is very level in its lower portion, becoming somewhat hilly near its inner border. The coast itself is lined almost throughout its length of 375 miles by lagoons cut off from the sea by long, narrow sand islands. The northern lagoons generally extend some distance inland in large, irregular bays and estuaries, lined partly by low marshy shores, partly by high bluffs. The principal bays are those of Galveston, Matagorda, San Antonio, and Corpus Christi. The western part of the coastal plain is a belt of rolling country known as the Black Prairie, about 100 miles wide in the north and south, but very narrow in its middle portion. It is succeeded on the northwest by a very broad belt of country called by geologists the central denuded region. This rises from a height of 600 feet in the east to over 2000 feet in the west, being bounded by the escarpment of the Llano Estacado, and is a rugged and much eroded, though not mountainous, region, with ridges, prairie valleys, isolated tablelands, and irregular depressions. It is bounded on the west and southwest by the Plateau Region, a southern continuation of the Great Plains. South of the Panhandle this forms a large, flat-topped table-land, the Llano Estacado, which from an altitude of 4000 feet falls on the east into the Denuded Region in a high, steep, and ragged escarpment cut back by several large river valleys. On the southeast it runs out into a lower plateau of different formations known as the Grand Prairie. This sweeps around the southern end of the Denuded Region, and geologically, and according to some also topographically, it runs northward between the latter and the Black Prairie, though it is here much lower than in the south. It extends southward to the Rio Grande Valley, and is bounded on the southeast by an escarpment. The last topographical region is the portion of the State lying beyond the Pecos River in the southwest. This is a mountainous country with a number of high, isolated, and barren ridges alternating with broad and arid plains. The highest point is Guadalupe Peak, with an altitude of over 9000 feet.

Hydrography. Practically all the rivers of Texas flow southwestward. With the exception of the Canadian River in the north and the Rio Grande with the Pecos in the south, which rise in the Rocky Mountains, all the larger rivers rise on the eastern edge of the Great Plains, the Llano Estacado, and the Grand Prairie. The extreme northern part of the State belongs to the Mississippi basin. The Canadian River crosses the Panhandle to join the Arkansas, while the Red River rises on the escarpment of the Llano Estacado and forms for a long distance part of the northern State boundary. The independent rivers flow directly to the Gulf of Mexico, and all, except the Brazos and Rio Grande, empty through estuaries into the coast lagoon. The principal rivers are the Sabine, on the Louisiana boundary, the Neches, Trinity, Brazos, Colorado, Guadalupe,

San Antonio, Nueces, and the Rio Grande. Most of these rivers flow through deep cañons immediately after leaving the Great Plains. Several of them are navigable for considerable distances at high water, but their mouths are generally obstructed by bars.

Soil. The alluvial bottom lands along the lower river courses are the most fertile portions of the State. Next to these ranks the Black Prairie belt, which is covered with a remarkably fertile marl formed by the mixture of clay with the disintegrated Cretaceous limestone. The soil of the coastal plain is generally sandy; in some places the sand is mixed with clay to form a black loam. In the northwest there are heavy deposits of red clay containing much potash, but little nitrogenous matter. The soil on the southern plateau is thin, but the Llano Estacado is covered with a red sandy loam which would be rendered fertile by irrigation.

Climate. As Texas reaches to within two and a half degrees of the tropical zone, it naturally has a warm climate, but the great range in latitude, and to some extent in altitude, produces also a considerable range in climatic conditions. Although warm, the climate is drier and less enervating than that of the other Gulf States. The mean temperature in July at Galveston on the coast is 83.7° F., at El Paso in the extreme west 81.9° F., and at Amarillo in the northwest 76° F. The corresponding figures for January are 52.7° F. at Galveston, 44.5° F. at El Paso, and 31.9° F. at Amarillo. On the coast the temperature seldom falls below the freezing point, while in the northwest it may fall several degrees below zero. In the western uplands, on the other hand, the temperature rises above 100° F., while on the coast the maximum is between 90° F. and 95° F. In winter the State is subject to severe north winds, known as northers, which often lower the temperature 50 degrees in a few hours. In the eastern section the southeast winds from the Gulf are prevalent and bring abundant rain to that part of the State. The rainfall decreases rapidly westward, so that in the western part it is insufficient for agriculture without irrigation. In the eastern portion, near the mouth of the Sabine River, the rainfall is sometimes over 60 inches, while in the extreme south, even near the coast, it is sometimes only 5 inches in a year. The normal annual average at Galveston is 49 inches, at Corpus Christi 30, at Austin 34, at Abilene, nearly in the centre of the State, 25, at Amarillo, in the Panhandle, 22, and at El Paso 9 inches.

Vegetation. The principal forest area of Texas is in the extreme eastern portion. The coast is bordered by marshes and prairies extending 30 or 40 miles inland. North of the prairies in the eastern quarter pines prevail, long-leaf pine in the lower and short-leaf in the higher pine barrens. Westward towards the centre of the State the deciduous species predominate—oaks, elm, maple, hickory, mulberry, sweet gum, ash, and walnut. The Osage orange is common in the black prairie region, and the dwarf palmetto in the eastern part lends a tropical aspect to the vegetation. In the river bottoms the characteristic species are cottonwood, pecan, various oaks, sweet gums, sycamore, ash, and cypress. Along the western border of the Black Prairie two parallel belts of hardwood forest, chiefly oak, and known as

the Cross Timbers, extend southward as far as the Brazos River. To the south and west of these the State is practically treeless except along rivers. There are scattered areas of scrub and chaparral composed largely of mesquite, the most characteristic tree or shrub of western Texas. Still farther west even the prairie grasses give place to or grow in the midst of a desert flora in which the yuccas and cacti predominate.

Geology and Minerals. The oldest rocks come to the surface in the central denuded region. In the southern part of this region, west of Austin, there is a small area of Archean rock surrounded by a narrow outcrop of Cambrian and Silurian strata. To the north of this there is a considerable area of Carboniferous formation, followed on the northwest, along the eastern base of the Llano Estacado, by a still larger region of Permian rocks. Another large area of Paleozoic and early Mesozoic rocks is found in the Trans-Pecos region, where the predominant formation is Triassic, as in the Panhandle, and of Ordovician, Carboniferous, and Permian, as in the Marathon Plains and in the Glass Mountains. In the westernmost mountainous part of the State there is much Tertiary igneous rock. The Llano Estacado, like the Great Plains to the north, is of comparatively recent formation, consisting of lacustrine Tertiary and Pleistocene deposits. The southern plateau or Grand Prairie region is older, being of Lower Cretaceous formation, and this formation also skirts the central Paleozoic area on the east. It is succeeded on the east by a band of Upper Cretaceous strata constituting the Black Prairie belt. Beyond this the coastal plain is composed to a large extent of marine Tertiary deposits. Workable beds of bituminous coal occur in the central portion of the State, and large deposits of lignite are stretched along the western border of the coastal plain. In the eastern part of the State, near the mouth of the Sabine, petroleum deposits of great extent have been found at a depth of from 600 to 4000 feet. Other oil fields have been developed in Wichita, Clay, Palo Pinto, Shackelford, Navarro, and Williamson counties. Gas has been discovered in San Patricio County. Iron and copper ores, as well as lead and tin, occur in the southeastern part of the central region, and silver is found in the west. The Trans-Pecos region, still but partly explored, probably contains varied mineral deposits, the most important being the cinnabar ores found in the Cretaceous limestone in the south. The most important of the remaining minerals are the immense beds of gypsum found in the Permian strata of the northwestern Red Lands.

Mineral Resources. In 1914 Texas ranked eighteenth among the States in value of mineral products, the value of the total production in that year being \$30,363,426. Petroleum is the most important product and the State was fourth in quantity and seventh in value of oil marketed in 1914, the production amounting to 20,068,184 barrels valued at \$14,942,848. Fully half of the oil produced comes from the Electra field in the north. Coal is second in importance, Texas being unique among the States in producing considerable quantities of both bituminous coal and lignite. It is believed that about 55,000 square miles are underlain with lignite, while the known bituminous areas measure about 8200 square miles. In 1914 there were

produced 2,323,773 tons valued at \$3,922,459. Clay products, consisting of common brick, sewer pipe, vitrified brick, pottery, and front brick, hold a prominent position in the State's mineral resources. The production in 1914 was valued at \$2,280,987. In 1914 there were produced 2,096,140 barrels of cement valued at \$2,686,653. Texas is one of the leading States in the production of quicksilver, upward of 112,500 pounds being produced annually. In the production of asphalt Texas ranks first. This is chiefly residue obtained from the heavy asphaltic oils, though natural asphalt is found in considerable quantities. The manufactured asphalt produced in 1914 amounted to 57,934 tons valued at \$608,132. Other minerals produced are gypsum, salt, stone, lead, lime, silver, sulphur, and zinc.

Agriculture. Texas has an approximate land area of 167,934,720 acres, of which 112,434,067 acres were in farms in 1910. The improved land in farms was 27,360,666 acres and the number of farms 417,770, averaging 269.1 acres. The total value of farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was \$2,218,645,164. The average value of land per acre was \$14.53. Of the total number of farmers in 1910, 198,195 were owners and managers operating 87,155,963 acres, and 219,575 were tenants operating 25,279,104 acres. The native-white farmers numbered 318,988, the foreign-born whites 28,864, and the nonwhite 69,918. The tenants among the whites numbered 170,970 and among the nonwhite farmers 48,605, operating 22,956,867 acres and 2,322,237 acres respectively. Of the foreign-born whites, 10,815 came from Germany, 5236 from Austria, and 1026 from Sweden.

The following table shows the acreage, production, and value of some of the principal crops as estimated for 1915 by the United States Department of Agriculture.

CROPS	Acreage	Production in bushels	Value
Corn.....	7,450,000	175,075,000	\$101,544,000
Wheat.....	1,475,000	22,862,000	24,462,000
Oats.....	1,250,000	44,375,000	18,638,000
Potatoes.....	42,000	2,730,000	2,866,000
Sweet potatoes..	60,000	5,880,000	4,116,000
Hay.....	450,000	*765,000	6,044,000
Cotton.....	10,200,000	†3,175,000	168,812,000
Rice.....	260,000	7,930,000	7,058,000

* Tons.

† Bales.

In 1909 Texas ranked third among the States in the total value of all crops. This amounted to \$298,133,466 and the acreage of all crops reporting such was 18,389,092. In that year the leading crops in order of importance were corn, cotton, cottonseed, hay and forage, rice, kafir corn and milo maize, oats, wheat, and sweet potatoes and yams. Texas is the leading State in the production of cotton. The principal producing counties form a group in the eastern part extending from the Red River to the southern boundaries, but concentrated particularly in the Calcareous prairies. Ellis, Hill, McLennan, Williamson, and Navarro counties are the leading producers. In 1909 the total acreage under cotton was 9,930,179 and the production 2,455,174 bales, valued at \$162,735,041. Corn had an acreage of 5,130,052 and a production of 75,498,695 bushels, valued at \$50,564,618. The acres of hay and forage harvested in

1909 amounted to 1,311,967, the crop amounting to 1,257,845 tons, valued at \$12,824,433. In the production of rice Texas ranks second and, in 1909, 237,586 acres were devoted to it. The production was 8,991,745 bushels, valued at \$6,106,323. Kafir corn and milo maize had an acreage of 573,384 and a production of 5,860,444 bushels, valued at \$3,785,463. To oats were given 440,001 acres, and the production amounted to 7,034,617 bushels, valued at \$50,564,618. The area devoted to wheat was 326,176 acres; the production was 2,560,891 bushels, valued at \$2,891,061. The acreage under sweet potatoes and yams was 42,010, and the production 2,730,083 bushels, valued at \$2,197,799. Irish potatoes had an acreage of 36,092 and a production of 2,235,983 bushels, valued at \$1,825,150. Vegetables other than potatoes and yams had an acreage of 124,690 and a production valued at \$8,099,306. Of the small fruits strawberries were most important in value in 1909. The area devoted to small fruits in 1909 was 5053 acres, producing 6,182,742 quarts, valued at \$480,331. The most important orchard fruits were peaches, apples, pears, and plums. The value of the total production of orchard fruits was \$1,060,998. Texas is noted for its production of pecan nuts, which in 1909 amounted to 5,832,367 pounds, valued at \$556,203. Of the tropical fruits raised, figs are the most important; the production in 1909 was 2,411,876 pounds, valued at \$97,078. The total value of the sugar-cane products in 1909 was \$1,669,683, by far the greater part of which was from sorghum cane. The sirup made amounted to 2,246,774 gallons, valued at \$1,106,733.

Live Stock and Dairy Products. Texas is the leading grazing State and ranching is still one of its greatest interests. In 1915 it was far ahead of any other State in the number of neat cattle and of mules; in 1909 ranking second in the total value, \$313,164,540, of the domestic animals on farms. The United States Department of Agriculture estimated that on Jan. 1, 1916, there were 1,180,000 horses valued at \$92,040,000, 768,000 mules valued at \$76,800,000, 1,119,000 milch cows valued at \$57,069,000, 5,428,000 other cattle valued at \$179,667,000, 2,156,000 sheep valued at \$7,977,000, and 3,197,000 swine valued at \$24,617,000. The amount of wool produced in 1915 was 9,280,000 pounds. In 1909 the amount of milk produced was reported as 197,039,954 gallons, butter made, 64,993,214 pounds, and cheese made, 194,990 pounds. The total value of milk, cream, and butter fat sold, and butter and cheese made in 1909 was \$15,679,924. The number of fowls on farms was reported as 13,669,645, and the eggs produced as 62,479,894 dozens, valued at \$9,586,114.

Irrigation. The normal rainfall varies from over 50 inches in the east to less than 10 in the west. This is sufficient for the growing of all crops throughout the eastern part and for some crops in the rest of the State. For this reason and because irrigation is not necessary every year, its practice has received less attention than in most of the States west of it. About 50 per cent of the area irrigated exclusive of that used for rice growing is in the valley of the Rio Grande. Irrigation is also common in the valleys of the Pecos and Nueces rivers. The number of farms irrigated in 1910 was 4150 and the area so treated was 164,233 acres out of pos-

sible 340,641 acres. The Carey Act does not apply to Texas and neither the United States Reclamation Service nor the Indian Service irrigates any land here. The number of independent enterprises in 1910 was 2161; the total length of ditches was 1663, of which 722 were in laterals. The main ditches had a capacity of 12,818 cubic feet per second. The acreage irrigated per mile of main ditch in that year was 1746.

Forest Products. The estimated area of forest land in Texas in 1908 was about 46,900 square miles. What valuable woods are found occur mostly in the east, though a great part of the timber is hardly fit for anything but firewood. In 1913, 341 active mills reported having cut 2,081,471 M feet board measure. Three or four species of pine make up about 96 per cent of the total lumber output. Next in importance are oak, red (sweet) gum, ash, cottonwood, and cypress. Farms having forest products reported a total value of \$8,925,662 in 1910. See *Manufactures*.

Manufactures. The manufactures of Texas depend largely upon the raw materials derived from its stock-raising, agricultural, and mineral-producing activities. In 1909 the State ranked seventeenth in value of products. The gross value per capita in that year was \$70. The table opposite gives the more important details for the 10 leading industries and the State as a whole for the years 1909 and 1904.

The slaughtering and meat-packing industry, one of the youngest in the State, had grown in less than a decade from a position of insignificance to be the most important in value of products in 1909. The value of material used in that year was \$37,409,785. The number of beeves slaughtered was 527,469, value \$15,089,886; calves 234,172, value \$2,074,188; hogs 939,674, value \$10,933,088. The most important product was fresh beef, of which there were produced 208,016,588 pounds, value \$12,408,125. The amount of pork produced was 32,054,404, value \$3,195,006. The flour and grist mills produced 3,339,479 barrels of white wheat flour, value \$19,110,676, 877,314 barrels of corn meal and flour, value \$2,875,994, 280,168 tons of feed, value \$7,325,154. Texas ranked seventh in the cut of lumber in 1909, 2,099,130 M feet board measure, of which 2,021,617 M feet were soft woods, the short-leaf yellow pine contributing by far the greater part. See *Forest Products*.

Of the total number of wage earners in 1909, 166,120 were male. The wage earners under 16 years of age numbered 1256, of whom 223 were females. The lumber and timber industry employed the greatest number of people in that year—25,843. For about half the wage earners, the prevailing hours of labor were 60 per week.

Dallas is the largest manufacturing centre. The leading industries as measured by value of products were in 1909 those connected with slaughtering and meat packing, flour and grist milling, cottonseed products, printing and publishing, leather goods, foundry and machine shops. The number of wage earners was 4882, employed in 305 establishments, and the value of products was \$26,959,000. Houston ranked second with products valued at \$23,016,000. San Antonio was third and had products valued at \$13,434,897. Other cities and the value of the products of their industries in 1909 are Fort Worth, \$8,660,882; Galveston, \$6,308,076; Beaumont, \$4,830,591; Waco, \$4,769,358. See also under individual titles.

Transportation. Texas is well supplied with both rail and water transportation. There are a number of streams which afford communication to a large area in the east and though navigable only to light-draft vessels, considerable transportation is done by water. Most of the railroad mileage is confined to the more closely settled part of the State, east of a line through Fort Worth, Waco, Austin, and San Antonio. There are several lines crossing the State from

the life of the Republic of Texas. The constitution of 1845, adopted after the admission of Texas into the Union, prohibited the creation of new banks, the necessary banking business being performed by the one existing bank and by private bankers. When after the Civil War the reconstruction forces came in, a new constitution was adopted which did not have this prohibitory clause, and in 1871 a free banking law was passed. Five or six banks availed

SUMMARY OF INDUSTRIES FOR 1909 AND 1904

THE STATE — TEN LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manufacture
			Total	Wage earners (average number)				
All industries.....	1909	4,588	84,575	70,230	\$216,876	\$37,907	\$272,896	\$94,717
	1904	3,158	57,892	49,066	115,605	24,469	150,528	58,924
Bread and other bakery products	1909	385	2,078	1,391	4,003	671	5,311	2,249
	1904	244	1,198	851	1,276	395	3,049	1,297
Cars and general shop construction and repairs by steam-railroad companies.	1909	62	10,527	9,782	9,362	6,715	13,359	7,813
	1904	47	9,025	8,593	4,599	5,370	10,473	5,997
Flour-mill and grist-mill products	1909	238	1,899	1,216	13,219	660	32,485	3,828
	1904	154	1,430	986	7,785	528	22,083	3,120
Foundry and machine-shop products.	1909	143	3,441	2,925	8,241	1,925	8,068	4,209
	1904	111	2,376	2,080	4,994	1,268	5,179	2,877
Liquors, malt.	1909	12	931	765	7,027	566	6,464	4,769
	1904	10	740	626	5,150	412	4,154	3,059
Lumber and timber products....	1909	799	25,843	23,518	45,552	11,602	32,201	21,197
	1904	391	16,101	14,623	20,452	6,500	18,880	13,925
Oil, cottonseed, and cake.....	1909	194	3,923	3,073	21,506	1,296	29,916	6,477
	1904	157	3,368	2,739	14,180	1,020	18,699	2,894
Printing and publishing.....	1909	1,067	7,177	4,408	9,127	2,785	11,887	8,780
	1904	850	5,288	3,444	6,107	2,071	7,830	6,067
Rice, cleaning and polishing.....	1909	19	643	430	3,820	189	8,142	1,020
	1904	17	609	432	2,139	212	4,640	1,132
Slaughtering and meat packing..	1909	14	14,248	3,639	12,438	1,902	42,530	5,120
	1904	9	2,354	2,019	6,375	866	15,621	2,028

east to west, and north-south travel is afforded by numerous roads. The railroads centre about Houston in the south and Fort Worth and Dallas in the north. Texas leads all States in the mileage of railroads. This (excluding siding and yard tracks) in 1914 was 15,569. Some of the principal roads with their mileage in that year are: the Southern Pacific, 2803 (Galveston, Harrisburg, and San Antonio, 1332; Houston, East and West Texas, 191; Houston and Texas Central, 828; Texas and New Orleans, 452); the Atchison, Topeka, and Santa Fe, 2334 (Cane Belt, 108; Concho, San Saba, and Llano Valley, 60; Gulf, Beaumont, and Great Northern, 78; Gulf, Beaumont, and Kansas City, 63; Gulf, Colorado, and Santa Fe, 1145; Gulf and Interstate, 70; Jasper and Eastern, 18; Panhandle and Santa Fe, 125; Pecos and Northern Texas, 570; Texas and Gulf, 95); the Missouri, Kansas, and Texas, 1119; the International and Great Northern, 1106; the Texas and Pacific, 1038; the Colorado and Southern, 745 (Abilene and Southern, 72; Fort Worth and Denver City, 454; Stamford and Western, 83; Wichita Falls and Oklahoma, 23; Wichita Valley, 113); the San Antonio and Arkansas Pass, 724; the St. Louis Southwestern, 695; the St. Louis, Brownsville, and Mexico, 472; the Chicago, Rock Island, and Gulf, 469; the Kansas City, Mexico, and Orient, 465; the St. Louis and San Francisco, 326 (Fort Worth and Rio Grande, 223; Paris and Great Northern, 17; St. Louis, San Francisco, and Texas, 85).

Banks. Only one bank was chartered during

themselves of this law, but after the reconstructionists were overthrown and home rule again established, the old prohibitory rule was again included in the constitution of 1875. Because of this prohibition, national banks reached a high degree of development, and their number rapidly increased. The number and condition of the various banks in 1914 is shown in the following table.

ITEMS	National banks	State banks	Private banks
Number.....	519	789	36
Capital.....	\$52,239,000	\$20,286,000	\$995,020
Surplus.....	26,988,000	4,758,169	284,970
Cash, etc.....	21,311,000	564,731	182,524
Deposits.....	174,033,000	52,218,506	2,351,108
Loans.....	40,172,000	65,143,936	3,191,221

Government. The present constitution was ratified by the voters in 1876, and has been amended in important details. The Legislature by a vote of two-thirds of all the members may propose amendments to be voted upon by the qualified electors, and these amendments when approved by a majority of the voters become part of the constitution.

Legislative.—The legislative power is vested in a Senate and House of Representatives, which meet biennially. The Senate consists of 31 members. The membership of the House of Representatives must never exceed 150. Senators are chosen for four years, half of whom

take office every two years. The members of the House are elected for two years. Senators must be at least 26 years old, and must have resided in the State for five years preceding their election. Members of the House must be at least 21 years of age, and must have resided in the State for two years.

Executive.—The executive department consists of the Governor, Lieutenant Governor, Secretary of State, Comptroller of Public Accounts, Treasurer, Commissioner of the General Land Office, and Attorney-General, all except the Secretary of State being elected by the qualified voters at the same time and places as members of the Legislature. The Governor must be at least 30 years of age, and must have resided in the State for five years preceding his election. He has power to convene the Legislature in extraordinary session, but must state specifically the purpose for which it is convened. The Secretary of State, appointed by the Governor with the advice and consent of the Senate, continues in office during the service of the Governor.

Judiciary.—The judicial power is vested in the Supreme Court, courts of civil appeals, a court of criminal appeals, district courts, county courts, commissioner courts, and such other minor courts as may be provided by law. The Supreme Court consists of a justice and two associate justices, who are elected and hold office for six years. The court of criminal appeals consists of three judges elected by the voters for a term of six years. This court has appellate jurisdiction coextensive with the limits of the State in all criminal cases. The State is divided into districts in each of which is a court of civil appeals. The judges of these courts are elected for six years.

Suffrage and Elections.—Every male of the age of 21 years or over, who has resided in the State for one year next preceding an election and six months within the district or county in which he offers to vote, and every male of foreign birth, who, in not less than six months previous to any election at which he offers to vote, shall have declared his intention to become a citizen of the United States, and who has resided in the State for one year next preceding the election, are deemed qualified voters. Voters are subject to pay a poll tax, those more than 60 years of age, or blind, deaf, or dumb, or permanently disabled are exempt. Primaries are held on the fourth Saturday in July of even years. In the year of a presidential election voters are given the opportunity to signify their preference for President and Vice President at a preferential election held on the first Tuesday in May.

Local and Municipal Government.—The legal subdivision of the State is the county. Cities and towns having a population of less than 5000 inhabitants are chartered by general laws. Cities of more than 5000 inhabitants may by a majority vote of the qualified voters adopt their own charter.

Miscellaneous Constitutional and Statutory Provisions.—All property both real and personal of a wife, owned and claimed by her before marriage, is her separate property. Provision is made for the guaranty of bank deposits by either giving a bond or contributing to a deposit fund. Provision is made for suspended and interminant cases of prisoners, and for parole of convicted persons. The State is under county local option as regards the liquor ques-

tion and about 87 per cent of the population were under "no license" in 1915.

Finances. The fiscal history of the Republic of Texas was mainly a record of debts, as the strained relations with Mexico demanded greater expense than the taxable property of the young Republic could bear. The issue of loans was stopped only by the inability to float them. An investigation by the Legislature of the State in 1848 ascertained the nominal debt to be \$9,647,253, to which the value of \$4,807,764 was assigned, as Texas decided to redeem its debt at its actual value when issued. By 1850 the nominal amount and assigned value of the debt were respectively \$12,322,443 and \$6,818,798. The sum of \$10,000,000 which the State received from the Federal government canceled the debt and left a surplus. By 1856 there was no State debt, and the surplus was over \$1,000,000. Several loans were made during the Civil War, but the war debt was repudiated by the first reconstruction Legislature. The disarranged condition of the finances necessitated the issue of new bonds in 1870 and the following years. By 1875 there was a debt of \$4,644,000, but the overthrow of the reconstruction forces in 1875 caused a radical change in the financial policy of the State. The constitution of that date prohibited any further issue of bonds, except for war purposes, as well as the lending of the State's credit to private enterprises. Because of the difficulty of paying the interest, the debt continued to grow for some time and in 1880 reached its maximum of \$5,566,928, after which it steadily declined. On Aug. 31, 1914, the bonded debt amounted to \$3,976,200, all of which was held by school, university, agricultural and mechanical college, and the various asylum funds. The income is derived mainly from a general property tax and sale and lease of public land. The total receipts in the fiscal year 1914 were \$14,608,344 and disbursements \$12,886,344. The cash balance was \$1,721,609.

Militia. The males of militia age in 1910 numbered 804,980. The organized militia in 1915 included 181 officers and 2956 enlisted men. It comprised a brigade of three regiments of infantry, a corps of cavalry, a battery of field artillery, and a detachment of sanitary troops with a field hospital.

Population. The population of Texas by decades since its admission into the Union is as follows: 1850, 212,592; 1860, 604,215; 1870, 818,579; 1880, 1,591,749; 1890, 2,235,527; 1900, 3,048,710; 1910, 3,896,542; 1915, 4,343,710; 1920, 4,663,228. The State ranked fifth in 1910. The density per square mile was 14.8, and the urban population 938,104. There were 2,017,626 males and 1,878,916 females. In that year the whites numbered 3,204,848, the negroes 690,049, and the Indians 712. The white population of foreign birth numbered 239,984. Of the latter Mexicans were the most numerous with 124,238; Germans numbered 44,917, and Austrians 20,566. The number of natives born in other States was 923,847. Those coming from Tennessee led in numbers with 134,702, Alabamans, Mississippians, and Arkansans following in order mentioned. The males of voting age numbered 1,003,357 whites and 166,398 negroes. The leading cities with their populations in 1910 and as estimated for 1915 are: San Antonio, 96,614 and 119,447; Dallas, 92,104 and 118,482; Houston, 78,800 and 108,172; Fort

Worth, 73,312 and 99,528; El Paso, 39,279 and 51,936; Galveston, 36,981 and 41,076; Austin, 29,860 and 34,016; Waco, 26,425 and 32,756.

Education. The chief educational problem in Texas lies in handling satisfactorily the rural-school situation in sparsely settled communities. Coupled with this there is the problem of a comparatively large colored population. A large decrease in the percentage of illiteracy in the decade for 1900 and 1910 indicated a considerable improvement in general conditions. In 1910 there were 288,904 illiterates of ten years of age or over, comprising 9.9 per cent of the entire population; among whites of native parentage there was a percentage of 3.3 per cent; among negroes the percentage of illiteracy was 24.6 per cent. The total school population according to the thirteenth census was 1,363,713; of these 793,796 attended school, of which 582,995 were native whites, and 130,708 were negroes. The total number of children over seven and under 17 years of age Sept. 1, 1913, the latest date for which statistics are available, was 1,048,570, according to the report of the State Superintendent of Schools. Of these, 840,130 were white, and 208,440 were colored. The State available school fund in 1913 was proportioned among the school population at the rate of seven dollars per capita, amounting in all to \$7,339,990. To this amount should be added \$5,899,619.96 raised through local taxation and \$1,143,865.03 received from other sources, making a total expenditure of \$14,383,968.04 or \$13.71 per capita for public education in Texas for the year 1913-14. There were 249 counties receiving State apportionment. Each county has a county superintendent and a school board. The Legislature of 1915 enacted a compulsory attendance law. It also passed a law establishing a county board of education. The normal schools are the West Texas Normal School at Canyon City, the North Texas Normal College at Denton, the Sam Houston State Normal College at Huntsville, the Prairie State Normal and Industrial College for colored persons at Prairie View, and the Southwestern State Normal School at San Marcos. Other State institutions are the State University at Austin, the Agricultural and Mechanical College of Texas at College Station, the State Medical College at Galveston, and the College of Industrial Arts. Other institutions of collegiate rank are: Simmons College at Abilene, Howard Payne College at Brownwood, Polytechnic College at Fort Worth, Texas Christian University at Fort Worth, Southwestern University at Georgetown, Westminster College at Tehuacan, Baylor University at Waco, and Trinity University at Waxahachie. These are all coeducational. Colleges for men only are St. Louis College at San Antonio, and Austin College at Sherman. Colleges for women are the Baylor Female College at Belton, the North Texas Female College at Sherman, and Asgard College at South Houston.

Charities and Corrections. The charitable and correctional institutions under the control of the State include the State penitentiaries at Huntsville and Rusk, the State Lunatic Asylum at Austin, the North Texas Hospital for the Insane at Terrell, Southwestern Insane Asylum at San Antonio, State Orphans' Home at Ersicana, State Epileptic Colony at Abilene, Deaf and Dumb Institute, State School for the Blind, Confederate Home, the Women's Confederate Home, and the Deaf, Dumb, and Blind Institute

for Colored Youth, all at Austin, State Juvenile Training School at Gatesville, the State Tuberculosis Sanitarium at Carlsbad, and the Girls' Training School at Gainesville. The last mentioned institution was opened in 1915.

Religion. The Baptists are numerically the strongest church, followed closely by the Methodists and Roman Catholics. These three bodies together contain considerably over three-fourths of the church membership. The Disciples of Christ (Christian), Presbyterians, and Lutherans are the only other Protestant sects numerically important.

History. The first Europeans to tread the soil of Texas were probably Cabeza de Vaca and three other survivors of the Narváez expedition of 1528. (See NÚÑEZ CABEZA DE VACA.) Cabeza de Vaca's account of his wanderings through Texas stimulated Mendoza, the Viceroy of Mexico, to send a party northward under Friar Marcos de Niza to search for the mythical Cibola or Seven Cities, rumored to be golden as Mexico. It returned empty-handed, as did an expedition led by Vázquez de Coronado (q.v.). Several other expeditions probably penetrated Texas during the next hundred years, notably those of Espejo in 1582, Sosa in 1590, and Governor Oñate of New Mexico in 1601 and in 1611. An entrada in 1650, led by Capt. Hernán Martín and Diego del Castillo, is said to have reached the Tejas (Texas) tribe of Indians in the region of the Neches and Sabine; one in 1684 under Padre Nicolás López and Capt. Juan Domingo de Mendoza crossed the Rio Grande into the Pecos country. The first town in the State, lying 12 miles north of El Paso, was founded in 1682 and called Taleta.

The history of the State practically begins in 1685 with the landing of La Salle (q.v.), and though his attempt at colonization ended in failure, the Spaniards took fright, fearing that France might seize the land. In 1690 Alonso de León and Padre Manzanet were sent to found a mission in that quarter, which was to serve the double purpose of holding the country and of converting the natives to Christianity. Mission San Francisco de los Tejas was accordingly founded among the Tejas Indians not far from the Neches River. The next year another expedition came out under Terán, but nothing resulted, and for years after Terán's entrada there was no further colonizing by Spaniards. French activity in Louisiana roused them, and in 1714 Juchereau de Saint-Denis, a bold French trader, led an expedition across the country to the Rio Grande, where he was made prisoner and sent to Mexico City. His account of Texas fired the Viceroy and Council to renewed efforts. In 1716 Capt. Domingo Ramón was chosen to lead an expedition which founded several missions. He settled San Antonio de Bejar, which in the course of time became the centre of the most prosperous group of missions in the Province of Texas, as it was now called.

For a half century mission founding went on, but it became apparent that failure was certain. Many establishments were abandoned, and some were moved about in the wilderness. The Indians destroyed more than one mission. When, in 1763, France surrendered Louisiana to his Catholic Majesty, the prime reason for the occupation of Texas no longer existed, as there could be no further French aggression from Louisiana. So the missions near the Neches and Sabine were abandoned and only those about San An-

tonio de Bejar—Alamo, Concepción, San José, Espada—showed signs of surviving. There came in time to be three main foci of settlements—at Nacogdoches in the east; at what is now Goliad in the south; and at San Antonio de Bejar in the southwest. The latter overshadowed the others in importance.

In 1799 Philip Nolan, an American, invaded the country from Louisiana with a small party for the ostensible purpose of purchasing horses. Two years later on a second expedition the Spaniards attacked the adventurers, killing some and sending the rest to Mexican mines. This was the beginning of the end of the Spanish régime. After the purchase of Louisiana in 1803, the people of the United States, and especially the inhabitants of the Southwest, looked on Texas as part of the destined dominion of the Republic and never lost an opportunity to strike at the Spanish power. In 1806 it looked as though war must result with Spain over the possession of the region. The United States claimed westward to the Rio Grande on the strength of the French occupation; Spain as stoutly disputed the claim, and in October, 1806, armies of the two powers stood facing each other across the Sabine. However, Gen. James Wilkinson, who commanded the Americans, was glad of the opportunity given him by the retreat of the Spaniards to the west of the Sabine and by the excitement attending the rumored conspiracy of Aaron Burr to make a neutral ground treaty with the opposing commander, Herrera, which practically conceded to Spain the territory west of the Sabine.

In 1810, when the great revolution in Mexico against Spain had begun, the Southerners sympathized intensely with the natives, and before very long were lending secret aid to Mexico. A filibustering expedition into Texas was led by James Long, a Natchez merchant and ex-officer in the United States army. At Nacogdoches Texas was declared a republic and a provisional government organized; but the Spanish forces soon broke it up. For several years the coast of Texas became a rendezvous for pirate and adventurer. Louis de Aury, Captain Perry, General Mina, and Lafitte are best known. They made Galveston Island their headquarters. From here Mina sailed on his expedition against the Spaniards in Mexico; and from here Lafitte the pirate scoured the Gulf till the United States government broke up the settlement. The early years of the nineteenth century witnessed the expiration of the Spanish power in Texas. What with the filibustering expeditions and hostile Apaches and Comanches, and the struggle for independence in Mexico, the Spanish foci of civilization were nearly extinguished. When the harsh Spanish law which forbade the entry of Americans into the region could no longer be enforced, frontiersmen from Kentucky, Tennessee, and Louisiana wandered in with their families and remained.

In 1821 Moses Austin secured from the Mexican government the right to establish a colony in Texas. He died soon after, but his son Stephen took up the work. Being free to choose the location for his colony, Austin selected the lower Brazos and Trinity valleys. Before long many empresarios had been granted, covering with claims the region from the Sabine to the Nueces. Discontent with the Mexican rule was not long in appearing. This reached a crisis on Dec. 16, 1826. The struggle which ensued is

known as the Fredonian War. A band of dissatisfied Americans, headed by Benjamin Edwards, proclaimed the eastern part of the State an independent republic with Nacogdoches as its capital. A skirmish in which one man was killed and one wounded ended the uprising. The time for a change was soon to come.

The United States was making repeated offers to the Mexican government to buy Texas, but this only made the Mexicans more determined to retain it at any cost. The Mexicans, resenting all attempts of the United States to possess the land; turned their attention to the Texans. Decrees were drawn up prohibiting slavery in Mexico and forbidding further colonization. These decrees were specially aimed at Texas and roused bitterness and indignation. The march of events was hastened by the closing of all Texas ports except Anahuac, and by the presence of military forces. An uprising occurred in June, 1832, which led to the removal of certain obnoxious officials. This was followed by the calling of a convention which elected Stephen F. Austin President. Petitions were drawn up asking the Mexican government for free trade for three years, begging for a grant of land from the State to promote education, and asking for a separate government. Austin was sent with the petition to Mexico, but could not gain a hearing and was made a prisoner. During 1833 and 1834 the Mexican government acceded to certain reforms; but in 1835 the spirit of revolt reappeared among the colonists. Then the Mexican government made another attempt to collect duties at the Texas ports. An armed schooner was sent to Anahuac, but after it committed various outrages, a Texas vessel captured it and the struggle against Mexico was precipitated. The first victory was that of Gonzales, Oct. 2, 1835, when the Texans put the Mexicans to flight. On October 28 Col. James Bowie and Capt. J. W. Fannin defeated the Mexicans near Mission Concepción, a few miles below San Antonio; on December 11 that city was taken. A provisional government was formed, Henry Smith was elected Governor, and Sam Houston major general of the armies of Texas: Branch T. Archer, William H. Wharton, and Stephen F. Austin were appointed commissioners to the United States. Many Americans, principally from Mississippi, hurried to the assistance of the Texans. Texan dissension, however, nearly proved disastrous. In March, 1836, two parties, one under Johnson and the other under Grant, were captured by Mexicans, and the prisoners slaughtered; Fannin's command, which had been in possession of the Goliad fortress, surrendered and was shamelessly massacred. Nearly 500 Texans met death. In February-March occurred the heroic defense of the Alamo (q.v.). March 2 the Texans issued a declaration of independence, and as if to answer this, Santa Anna, the Mexican President, hurried his army in three columns eastward over the country. On April 21 the Texan army under Houston on the field of San Jacinto avenged the slaughter of Fannin's men and the Alamo. (See SAN JACINTO, BATTLE OF.) Santa Anna, a prisoner, was glad to sign a treaty in which he engaged to do what he could for the independence of Texas with boundaries not to extend beyond the Rio Grande.

Thus was launched the Republic of Texas. A constitution was ratified in September, 1836, and Houston was elected President. Houston was the capital city from 1837 to 1839, when Austin

became the capital. The great and pressing need of the Republic was money. With little taxable property, the government ran deeply in debt. By 1841 the amount reached \$7,500,000. To the financial difficulties of the Republic was added the aggravation of invasions from Mexico, which had never abandoned her claims on the country. Three times Mexican forces reached San Antonio, but always retreated without attempting to hold the place.

Meantime the independence of Texas had been recognized by the United States, France, Holland, Belgium, and Great Britain, and the presence of the representatives of these powers lent zest to the interest with which the subject of the annexation of Texas to the Union was invested. The question of annexation was bound up with that of slavery, and the whole Union was agitated. (See under UNITED STATES.) The matter finally became a national issue, and James K. Polk was elected President on a platform favoring annexation; but before he took office a joint resolution was passed by Congress making an offer of statehood to Texas. This was accepted by the Texans, and in December, 1845, the State was formally admitted into the Union. The Mexican War (q.v.), originating in a dispute over the boundaries of Texas, followed, and the first fighting took place near the Rio Grande, at Palo Alto (May 8, 1846).

As a State of the Union Texas grew rapidly. Politics played small part until the wave of secession reached its borders. Texas, a slaveholding State, thereupon seceded from the Union (Feb. 1, 1861). Sam Houston was Governor at the time, and threw all his weight in opposition to secession, but there was no staying the resolve of the people, many of whom went soon to join the armies of the Confederacy. The State was fortunate in that it was not the scene of much active fighting. Galveston was captured and held by the Federal forces for three months in the fall and winter of 1862; but two attempts of the Union forces to enter the State from Louisiana were disastrously defeated. The last battle of the war was fought on the lower Rio Grande, near Palo Alto, a month after Appomattox.

Following out his plan of reconstruction, June 17, 1865, President Johnson appointed as provisional Governor A. J. Hamilton, a man conspicuous in antebellum Texas politics. A convention was called which adopted the constitution in force in the State prior to secession, with amendments recognizing the abolition of slavery, renouncing the right of secession, conferring civil rights on freedmen, repudiating the State debt incurred during the war, and assuming the tax which had been laid by the United States government on the State during the period of secession. The people ratified this constitution, and under it J. W. Throckmorton was elected Governor. The Reconstruction Acts of 1867 placed the State under the military authority, with General Sheridan in command. The carpetbaggers followed and the new reconstruction occupied the next three years. A constitution was submitted to the people in November, 1869, when Congressmen and State officers were elected, and on March 30, 1870, Texas was readmitted to the Union. At the election in November, 1872, the Democrats secured control of the State; and in December, 1873, a Democratic victory made Richard Coke Governor. By this time the State had become involved in debt

to the extent of several millions of dollars on the score of reconstruction. The memory of reconstruction and the race problem have served to keep the State consistently Democratic.

The decade ending in 1915 was taken up largely with the elimination of the influence of large corporations and with the prohibition question. The Standard Oil Company and its subsidiaries were finally driven from the State. Several attempts to adopt constitutional amendments providing for State-wide prohibition failed, but legislation putting the sale of liquor under strict supervision was enacted. In the presidential election of 1908, Bryan received 216,737 votes, and Taft 64,602. Measures prohibiting betting at races and a bank guaranty bill were adopted by the Legislature of 1909 in a second extraordinary session called by Governor Campbell. O. B. Colquitt was elected Governor in 1910. In the presidential election of 1912 Wilson received 221,425 votes, Taft 28,688, and Roosevelt 26,740. Governor Colquitt was reelected. James E. Ferguson was elected Governor in 1914, and at this election a constitutional amendment providing for the initiative and referendum was defeated. See articles UNITED STATES and MEXICO for conditions brought about in Texas by the revolutionary conditions in Mexico. See GREAT AMERICAN DESERT.

GOVERNORS OF COAHUILA AND TEXAS

José María Viesca, First Constitutional Governor.....	1827-30
Rafael Eca y Musquiz.....	1830-31
José María de Múzquiz.....	1831-32
Rafael Eca y Musquiz.....	1832-33

TEXAS, UNIVERSITY OF. A coeducational State institution at Austin, Tex., with a medical department at Galveston, founded upon a grant of 1,000,000 acres of land by the Legislature in 1876. In 1883 an additional million acres was set apart and the university was opened. The medical building at Galveston was completed in 1890, when the department was opened and the John Sealey Hospital, presented the previous year, was occupied. The medical buildings were in great part rebuilt after the disastrous Galveston flood of 1900. Besides the medical department, the university embraces the departments of literature, sciences, and arts, offering the degrees of B.A., M.A., and Ph.D.; the department of engineering, conferring the degrees of bachelor of science in architecture, in civil engineering, in electrical engineering, and in mechanical engineering, and also the degrees of C.E., E.E., M.E., and master of science in architecture; the department of law, conferring the degrees of LL.B. and LL.M.; and the department of education, divided into schools, as follows: the art of teaching, educational administration, the history of education, and the philosophy of education. The department of extension was organized in 1909 and the graduate department in 1910. Two summer schools are conducted at Austin during June and July. In 1914-15 the student attendance was 3445. The library had 115,000 volumes. For 1915-16 the endowment was \$2,000,000 and the income \$940,000. The acting president in 1916 was William James Bante.

TEXAS CHRISTIAN UNIVERSITY. An institution for higher education, founded at Fort Worth, Tex., in 1873, under the auspices of the Disciples of Christ. The total attendance in all departments in the autumn of 1915 was 697 and the faculty numbered 34. The plant of the university includes five buildings, and the total value of the equipment was about \$500,000. The library contains about 5000 volumes. The president in 1916 was F. D. Kershner, M.A., LL.D.

TEXAS FEVER (also known as BOVINE PIROPLASMOSIS, or BABESIASIS, SPLENETIC FEVER,

TICK FEVER, SOUTHERN CATTLE FEVER, HEMOGLOBINURIA, REDWATER, DRY MURRAIN, BLACKWATER, SPANISH FEVER, ETC.). A febrile infectious disease of cattle, usually observed in zootic extension in the course of which hemoglobin appears in the urine as a result of the breaking down of red blood corpuscles. It is caused by (*Piroplasma*) *Babesia bigemina* in the red blood corpuscles. This protozoan is transmitted to uninfected cattle by the progeny of ticks, particularly of the genus *Margaropus* or *Boöphilus*, that have developed on infected animals. The disease is characterized by fever, greatly enlarged spleen, destruction of the red blood corpuscles, escape of the coloring matter of the blood through the kidneys, giving the urine a deep-red color, yellowness of the mucous membranes and fat, rapid loss of strength, and fatal results in a large proportion of cases.

Medicinal treatment has but little value, although in chronic cases and those occurring late in the fall beneficial results have followed the administration of Epsom salts and quinine, and stimulating tonics. Recent work indicates that the dye known as trypanblue has a valuable curative effect when introduced intravenously. When the disease has broken out, all animals should at once be removed to a pasture known to be free from ticks in order that noninfected animals may be kept free. All ticks should be removed from sick animals in order to prevent the abstraction of blood and thereby retard the final recovery. Good nursing and a nutritious laxative diet with plenty of clean drinking water are essential.

In order to protect animals shipped into infected territory, they are immunized at from 6 to 15 months of age by introducing the microparasite from immune animals into their systems. Animals immunized in this way have a mild form of the disease which usually appears in from 3 to 19 days after the first inoculation and runs a course of from 6 to 8 days, followed in 30 days after the injection by a second attack of a milder character than the first.

Work of eradicating the cattle tick, which transmits the disease, from the southern United States—where the disease occurs—has been conducted by the United States Department of Agriculture in coöperation with the infected States. Up to July 1, 1915, a total area of 275,782 square miles had been released as free from ticks, or more than one-third of the original area in the United States infested with the cattle tick. Tick eradication may be accomplished through dipping infested animals in vats which contain a solution sufficiently strong to kill the ticks without injury to the host. A system of pasture rotation whereby the ticks meet death from starvation before finding a host is also made use of.

Y., 1911); Hutyra and Marek, *Special Pathology and Therapeutics of the Diseases of Domestic Animals*, vol. i (Amer. ed. from 3d Ger. ed., by Mohler and Eichhorn, Chicago, 1912); United States Bureau of Animal Industry, *Special Report on Diseases of Cattle* (rev. ed., Washington, 1912).

TEXAS RANGERS. See RANGERS, MOUNTED.

TEXAS STEER. See CATTLE.

TEXAS UMBRELLA TREE. See CHINA TREE.

TEXCOCO. See TEZCUCO.

TEXEL. The southernmost and largest of the West Frisian Islands, belonging to the Dutch Province of North Holland, and situated at the entrance to the Zuider Zee (Map: Netherlands, C 1). It is separated from the mainland on the south by the Marsdiep about 5 miles wide. Area, 73 square miles. It consists largely of good meadow land lined on the north and west by sand dunes, and protected from the sea on the other sides by dikes. The principal industry is sheep raising, there being some 34,000 sheep on the island, and wool and cheese of fine quality are exported. Pop., 1899, 5954; 1909, 6407.

TEXIER, tēs'yā', CHARLES FÉLIX MARIE (1802-71). A French archaeologist, born in Versailles. He explored the antiquities of Asia Minor and taught at the Collège de France. His works include: *Description de l'Asie Mineure*, published in Paris and London (1839-48); *Description de l'Arménie, la Perse et de la Mésopotamie* (1842-45); *Asie Mineure* (1862).

TEXTILE DESIGNING (Lat. *textilis*, relating to weaving, from *textus*, fabric, composition, text, from *texere*, to weave; connected with Gk. *τέκτων*, *tekton*, carpenter, *τέχνη*, *technē*, art, Skt. *taks*, to cut, form). That branch of textile manufacturing which is devoted to the construction of fabrics, their weaves and patterns or designs for the same. Unlike the designing for printed patterns, whether for textiles, wall-paper, or other purposes, which are termed applied designs—and for which the designer is only called upon to use his skill in drawing and color combination—the designing of fabrics in which the pattern is to be woven of threads colored before weaving, or in which the pattern is produced by the weaves, necessitates in addition to knowledge of combining colors and drawing a thorough knowledge of each of the various departments or processes of textile manufacturing (q.v.). The designer must be able to construct fabrics of a required weight, texture, and finish, or for a specific purpose, telling the manufacturer what size of warp and filling to use, how many threads of each to the inch, and what weave will give the required results.

The construction of various weaves is one of the most important features of textile designing, and an account of weave construction will be found in the article WEAVING. A complete design for a woven fabric must contain at least the following specifications: Number of warp threads to an inch; number of inches wide on loom; number of picks, or filling threads, to an inch; size of warp and filling yarns and materials for same; the weave and the arrangement of the warp thread on the loom harness, with full particulars relative to manipulation of materials in the process of manufacturing; the estimated weight of the fabric as woven; the finishing processes it is to be submitted to, together with its finished width, weight, and texture, that is, the count in warp and filling threads to the inch. When the pattern is to be worked out in colored threads the arrangement of these must be given; and when the pattern is drawn and possibly colored, then the weave is constructed in such a way as to produce with the woven threads the effect of the drawing as nearly as possible. See LOOM; WEAVING; TEXTILE MANUFACTURING.

TEXTILE MANUFACTURING. The industrial group of manufactures embracing the production from the various raw materials of fabrics of cotton, wool, silk, flax, hemp, and jute; hosiery and knit goods; felt goods and wool hats; cordage and twine; laces, braids, and embroideries.

Textile Manufacturing in the United States.—Statistics. The importance of the textile industry in the United States is seen from the table (I, page 148) of statistics derived from Census Reports of 1920 and earlier years which shows 75.4 per cent increase in the capital invested, during the first decade of the present century, over the decade immediately preceding; and an increase of 141.3 per cent from 1909 to 1919. There was an increase of 59.7 per cent in the annual amount of wages paid between 1899 and 1909 and 170.1 per cent from 1909 to 1919. An exact knowledge of the general growth of the industries is difficult to arrive at, in consequence of varying conditions, and probably the best idea of its growth is the increase of wage earners as shown by decades in Table II. The increase in the annual value of the manufactured product rose from 79.2 per cent in 1899-1909 to 221.3 per cent in 1909-1919. In spite of the fact that the improved machinery makes the productive power of one man's labor many times greater than it was a half or three quarters of a century ago, the increase in wage earners each decade has exceeded the general growth of the population of the country except in the decade between 1850 and 1860.

The importance of the industry is also shown by Table II, which shows not only the "combined textiles," but individual industries classed to show conditions by decades, 1860-1919 and in more detail for the last named year in Table III.

The increase in the amount of the various raw materials used by decades from 1840 to 1919 is shown by Table IV, which also furnishes a measure of the relative growth of the several industries. It is well to notice in this connection, however, that because of the unsettled conditions in the Southern States from 1860 to 1870 there was a decrease in the amount of cotton used, while for each decade there is a large and steady increase in the amount of wool used. During the twenty-year period 1860 to 1880 the amount of cotton used did not double itself, while the use of wool increased over 300 per cent; but the use of cotton shows a wonderful increase from 1880 to 1919, due largely to the development of the cotton-manufacturing industry in the Southern States, which bids fair to monopolize the production of the medium and coarser grades of cotton fabrics.

The world's production of commercial cotton in 1914, i.e., the amount available for mill

purposes was approximately 24,764,000 bales of 500 pounds net weight, representing a maximum from which there was a decline due to the war and other causes so that in 1921 this production was estimated at about 15,593,000 bales, the smallest crop since 1900.

The world's consumption of cotton for 1919 was estimated at 15,970,000 bales. In the United States in 1919 the cotton-growing States took 2,938,000 bales and the other States 2,401,000

as in Tables II and III, the rapid growth. It must be said, however, that modern machinery is being introduced and these countries are destined to figure not only as sources of raw but of manufactured material. (See SILK.)

Influences Controlling Development. The influences controlling the establishment of the textile industry in a given country are primarily the supply of the raw material and the adaptability of the people to manufacturing

TABLE I

COMPARATIVE SUMMARY OF TEXTILE INDUSTRIES, 1880 TO 1919, WITH PER CENT OF INCREASE

	COMBINED TEXTILES						
	Number or amount				Per cent of increase

bales. There were 153,657,680 active and idle spindles in the world in 1922, of which there were in the United States 36,843,000. In 1919 there were in the United States 33,718,953 active spindles. There were located in the South Atlantic States at that time 12,708,516 active spindles, in New England 17,542,926, and in the other States 3,467,571.

Great Britain leads in cotton manufacturing as may be told from her greater number of spindles; but because of the fact that the greater part of the spindles in the United States run on coarse or medium-sized yarns, and those of England on much finer yarns, the United States actually spins more pounds of the raw material.

Great Britain has perhaps the most important woolen industry, since the quality of wool used is better and a greater amount of labor is employed. More fine goods are produced in France than in the United States. The carpet industry, which absorbs large quantities of wool, is probably more important in the United States, but large amounts of coarse goods are produced in both countries. See WOOL MANUFACTURES; also SHEEP.

Among the several countries engaged in silk manufacturing the United States now stands in first place, having surpassed France in the value of its product in the early years of the twentieth century. This is the more remarkable when we consider that the industry in the United States has been developed since 1870, and note,

life. Among the earliest forms of machinery are the hand loom and spinning wheel; and as sheep usually are raised in any country where clothing must be warm, it is not surprising to find in the world's earliest history records of the production of fabrics of wool; these came to be known as homespun, because made from yarn spun at home and woven by hand in the household. That the woolen industry should spring up in primitive communities, and among people not easily able to purchase clothing material, is only natural; as the comforts of life became more accessible and labor became diversified and specialized, owing to the increase in population, the tendency was to produce fabrics for sale and in such quantities as required the use of more improved machinery; and in order to reduce the cost further large numbers of machines were collected and there resulted the mill or factory.

As cotton is a subtropical plant and the lint is easily separable from the seed by hand, and as the fibre can be spun and woven in as simple a way as wool was manufactured in primitive communities, it would seem that the cotton industry should have developed near the source of the raw material; but the sections of the countries suited to raising cotton were largely inhabited by people with agricultural instincts, hence the industry developed in thickly settled communities remote from the cotton field. One important feature in the early days of the cot-

1 Includes woolen and worsted goods, felt goods, hats, wool-felt, wool shoddy, wool pulling and wool scouring, hats — (fur-felt).

2 Finished products, throwing and winding.

3 Includes also hats and mending, from coars fiber, grass and color.

4 Includes also hats and mending, from coars fiber, grass and color.

5 Carpets and rugs, other than rag, and hachcloth.

6 Includes proprietors and firm members with their salaries; number only reported in 1900 and 1905 but not included in this table.

7 In addition to these data there were in the census of 1880 returns for 19 persons in the cotton yarn into hosiery, webbing, tapes, and fancy fabrics and mixed goods on other 272 feet, which are not included in this table.

8 These 249 establishments reported \$11,224,448 capital. In 1890 this class of mills is reported under a number of different heads, although some of them may be included in the totals for textile industries presented in the figures for 1890.

9 At the census of 1870 the value of the fabric itself was reported, whereas in all subsequent censuses merely the value added to such fabric by the process of dyeing and finishing is given.

ton industry in factories was the fact that cotton fabrics must necessarily be light in weight and of comparatively fine yarns—consequently the proportion of labor cost to the cost of pro-

In the thickly settled centres of India the industry had its greatest growth in a semitropical country, fully adapted to the production of the fibre; yet the inhabitants make better laborers

duction was much greater than in the production of fabrics of wool, and the tendency was to concentrate in their production; this also stimulated invention of labor-saving machinery. The result is that virtually the whole manufacture is in the hands of invested capital, and the tend-

in the factories than they do cultivators of the crop. Those who follow agricultural pursuits are content to do so in a small way, simply raising the product for individual use rather than in commercial farming.

In China, Japan, the East Indies, and Mexico there has been of recent years a considerable introduction or development of the industry, due almost entirely to the adaptability of the people to a manufacturing life. Yet it is doubtful if the movement would have been as successful in some of these cases if there had not been encouragement in the way of government measures.

The most wonderful growth of the cotton-manufacturing industry has been in the southern United States. The availability of the raw material, made possible largely by the agricultural labor of the negro, and the presence of a class of the white population who, after the Civil War, found themselves without homes or occupation and who it was found were teachable and tractable, and would make good factory hands, and were to be had in abundance, were chief factors in this development; there were available water power and land which could be secured cheaper than elsewhere, and at first municipal aid in the way of exemption from taxation for a term of years. The growth of the industry in the Southern States has been remarkably steady since 1880, and ample proof of its success is evidenced by the fact that more and larger mills have been built and that older ones have been enlarged and developed.

ency is for it to expand in communities where it is already established, and, unless favored by special advantages, to languish or to be neglected in sections where it is newly introduced.

The sources which first gave the so-called civilized nations their fine and beautiful fabrics of silk were China and Japan; there the silkworm flourished, labor was plentiful and cheap, and the nations esthetic; they produced beautiful and costly fabrics which were considered luxuries as far back as the nations have a history, yet these nations now put forth less in value than

many others, though they still produce fabrics which the more highly civilized nations can hardly equal and latterly are increasing their commercial output due to the larger use of machinery. The growth of the silk industry should be greatest in those countries which can produce the raw material, but this is not always the case. The introduction of the silkworm into central and western Europe caused a remarkable expansion of the manufacture of silks in Switzerland, Italy, Austria, and France. The Germans, producing practically no raw silk, however, have made a great success of the industry, as has the United States in recent years. England, however, with a wonderful capacity for manufacturing, having attempted the silk industry, relying on imported silk, though fairly successful for a time, has seen it decline for the last half century, while the cotton industry during the same period has had an extraordinary development. The most important reason for this localization of cotton and silk mills found in the United States as in New England, Pennsylvania, New York,

Connecticut, and New Jersey is the presence of sufficient labor of requisite skill to manufacture the raw material and produce fine fabrics.

These are briefly the important features in connection with the development of the most important of the world's textile industries. Consult: E. A. Posselt, *Recent Improvements in Textile Machinery* (Philadelphia, 1905); A. F. Barker, *Textiles* (New York, 1910); *Lamb's Textile Industries of the United States* (5 vols., Boston, 1911); Ephraim Lipson, *The History of the Woolen and Worsted Industries* (London, 1921); W. H. Dooley, *Textiles for Commercial*,

TEXTILE PRINTING. The printed cloths of the eighteenth century in Europe were made in imitation of the Indiennes that for two hundred years had been imported from India, which may be regarded as the home country of printed cottons much as China is the home country of brocaded silks, and Flanders the home country of fine woollens. But block printing of textiles in one form or another can be traced back among the Egyptians, Assyrians, and Chinese to remote ages, and it was closely associated with other similar processes that produce similar results, such as painting, stenciling, and dyeing. In printing fabrics the color is stamped on from an engraved block or roller. Pliny says that the Egyptians figured fabrics by applying several mordants with different powers of resistance, presumably by stamping or stenciling, in such a way that one dipping in the dye pot produced a pattern in several colors. There are still preserved in European museums many examples of block-printed textiles from early Christian (Coptic) Egypt. A fragment of printed cotton was found at Arles in the grave of St. Cæsarius, who was Bishop there in the middle of the sixth century A.D. During the twelfth, thirteenth, and fourteenth centuries, in Germany the place of the rich Saracenic, Byzantine, and Italian damasks and brocades was largely taken by inexpensive block-printed imitations. There survive examples of Rhenish thin-printed silks with sim-

plified patterns in gold and silver; and coarse linens outlined in dark browns and blacks. In the seventeenth century the industry revived and Augsburg was famous for its printed linens, supplying Alsace and Switzerland with many trained workmen. In 1676 textile printing was introduced in England by a French refugee who opened an establishment on the Thames near Richmond. In the last half of the eighteenth century the art was brought to a high point of perfection in France, especially at Jouy, near Versailles, where Oberkampf produced printed linens that excelled in technique as well as in design, so that a leading place in the market to-day is held by modern reproductions of Jouy prints, some of these made from the original blocks. The most prolific designer for the works at Jouy, many of whose original drawings are still preserved at the Musée des Arts Décoratifs in Paris, was Jean Baptiste Huet. At this period the popularity of printed linens and wall papers became such that they crowded tapestries from the walls of even stately mansions, and brought to humbler homes decoration that had previously been lacking. At the end of the eighteenth century metal rollers took the place of wooden blocks for the production of simple repeat patterns inexpensively, and the modern machine period had begun. The invention of rollers is attributed in France to Oberkampf and in Great Britain to Bell. In the last quarter of the nineteenth century William Morris raised the standard of design greatly by his introduction of ingenious and richly colored flower and bird patterns, going back for his inspiration to Persian and Indian flat ornament, away from the modeled shapes and monotonous tiny repeats that had been in vogue in Europe since the Empire period. To-day block prints are again used for picture effects and large patterns, and the designs of the roller prints are growing constantly better. The block prints and the finer roller prints are on linen, the cheaper ones on cotton.

Block Printing. The blocks used are rectangular planks of wood about three inches thick, six inches wide, and nine inches long, built up out of two or more layers of pine with facing of sycamore, plane, or pear, and with a strong handle to lift them by. The design is transferred to the blocks by rubbing off a tracing in lampblack and oil of the outlines of the particular color, and then tinting the portions that are to be left in relief to distinguish them from those that are to be cut away. Fine details difficult to cut in wood, and that in printing from wood would wear down or break off, are inserted by coppering or building up with thin strips of brass bent to shape and driven edge-wise into the wood. Where large surfaces of solid color occur the background is cut away and replaced by felt that gives a better impression than is given by a large surface of wood. Besides his blocks the printer needs a table and a color sieve. The top of the table is a slab of stone that is covered with a thick woolen blanket. The color sieve is a shallow box which floats in a swimming tub of starch paste, and which has a bottom of fine woolen stuff over which the color is distributed evenly with a brush. The cloth comes from a roll on the right of the table, and after being printed is carried to the ceiling on rollers, from which it hangs until dry and ready for its next color. When the first section

of the cloth has reached its table the printer applies the block by applying it twice in diagonal directions to the color sieve, and then presses it hard against the cloth, driving home the impression by striking the back of the block with a heavy wooden mallet. The impression on the second block on the second section of cloth is made to join the first exactly by means of the guide pins at the corners of the block. These pin marks are one of the most obvious features that distinguish block from roller prints. The perrotine is a block-printing machine invented by Perrot of Rouen in 1834, and still occasionally used in France and Italy, which automatically prints three colors from long narrow blocks, infusing the second and third colors on the first while it is still wet.

Roller Printing. While the design in block printing is cut in relief on wood the design in roller printing is engraved on copper rollers. The process was patented for a six-color machine by Bell in England in 1785. In this machine, that now carries sometimes as many as sixteen colors, the rollers of the different colors are mounted around the circumference of a huge drum, the surface of which, wrapped with several thicknesses of lapping, takes the place of the block printer's table. As the drum revolves, the cloth is pressed between the drum and the rollers, each of which leaves its color and pattern, so that the cloth that comes to the drum in the gray, leaves it completely printed with all the colors. Each roller is inked by a wooden roller revolving in a color box below it, and has the surplus color (i.e., the color on the surface of the roller, as distinguished from the color in the engraved incisions) removed by a knife called the doctor. The roller printing is rapid and inexpensive, one machine producing from 10,000 to 15,000 yards a day. The pattern on the copper rollers is produced by etching, or by indentation from a mill. In the first process the pattern is photographed, magnified on a zinc plate, and colored by hand. Then the outlines of each color are engraved by hand, and transferred and reduced in the pantograph machine to a varnished copper roller which is then etched with nitric acid, the acid eating copper away only where the design has been pin-pricked with the pantograph needle. In the mill process the design is first engraved by hand on a soft steel roller, which is the die. The die is then hardened and rotated against a softened steel roller until the latter has the design in relief. This is the mill that when itself hardened and rotated against the copper roller produces this pattern on the latter in intaglio.

Stenciling. This process is nearer painting than printing, the colors being applied with a brush through sheets of thick paper or thin metal from which the pattern has been cut completely out with a sharp knife, the uncut portions covering the parts of the surface that are to be left uncolored. A peculiarity of stenciled patterns is the ties that have to be left to keep detached or nearly detached portions of the background connected with the rest of the stencil. These ties spoil the design when badly placed, but when skillfully used add distinctive charm. The Japanese are especially skillful in the use of stencils, often employing them in connection with painting and with block printing. As of blocks, so of stencils; there must be a separate set for each color. A special method of applying the color that produces results of unusual delicacy is spray printing with the air

brush, invented in Lyons and first practiced in America about the year 1908. Discharge printing stamps upon colors dyed in the cloth acids or alkalis that remove the colors or the mordants, producing patterns in white upon a colored ground. Resist or reserve printing stamps upon the cloth before the dyes are applied substances that prevent the dyes or mordants from fixing themselves. The effect is similar to that of discharge printing, and to that produced in a more primitive way in the Orient by tying knots in the cloth before dyeing, or by covering certain portions with wax. The printing of woolen and silk cloths is similar to that of cotton, except that the woolen cloth requires more preparation before printing and the silk cloth less; and that silks are particularly adapted to discharge and reserve effects. (See DYEING.) Consult: J. Persoz, *L'Impression des Tissus* (Paris, 1846); Rothwell, *Printing of Textile Fabrics* (Philadelphia, 1892); R. Forrer, *Die Kunst des Zeugdrucks* (Strassburg, 1894); Gerogievic, *Chemical Technology of Textile Fabrics* (Eng. trans. by Salter, London, 1902).

TEXTILES AND CLOTHING. Textiles and clothing taken together constitute one of the chief subdivisions of home economics, and form a subject which has to do with the chemical, physical, and biological nature of fibre, textiles, and other materials used, with the æsthetic, hygienic, and economic values of fabrics and articles of dress, with their relation to household management and with the principles governing their selection, preparation, and use. Broadly speaking, textiles include not only fabrics woven from wool, cotton, silk, linen, and other familiar natural fibres of animal or vegetable origin, but also those made from inorganic substances, such as asbestos, glass, and metal, and from synthetic materials, like artificial silk. Clothing includes all natural and manufactured articles used to cover the body, to defend it from injury, annoyance, the elements, or public gaze, or for purposes of ornamentation; and the term, when so employed, embraces articles for the head, feet, and hands, as well as for the body, and is nearly synonymous with costume (q.v.).

The item "clothing" occupies a conspicuous place in every classified list of expenditures, whether of family or individual, often representing a financial outlay exceeded only by the expenditures for food and shelter. Statistics reported by the United States Bureau of Labor show that in the case of family incomes not exceeding \$1200, about 14 per cent is spent for clothing; and, as the economist Engel demonstrated years ago, this general percentage obtains even in families of far ampler resources. Studies of the budgets of independent working women show a somewhat higher ratio of clothing to the total cost of living, and if to the sum spent for clothing there is added in all cases the cost of textiles used in house furnishing—bed and table coverings and draperies, etc.—the item assumes even greater significance. Because of the commercial importance of these two commodities and of the large sums now invested in their manufacture, problems connected with their production and use are of social as well as of household importance.

As the result of investigations in government, commercial, and private laboratories, information concerning the nature and properties of textile fibres is constantly accumulating, and many of the facts thus obtained have important

bearing on practical questions. Scientists who are studying methods of producing the various fibres are discovering distinctive characteristics of each which serve as a foundation for tests of purity. Others are studying fibres or fabrics with reference to their tensile strength, wearing qualities, reactions towards dyes or cleaning materials, or other matters connected with permanence of color or durability. Still others are studying clothing with reference to porosity, capillarity, hygroscopicity, and conductivity of heat or moisture, in order to throw light upon the relation of dress to comfort and health. The fine arts, too, are the source of much information, chiefly concerning color combinations and designs.

In spite of the rapid increase of knowledge, development of the subject along economic and educational lines has been slow—a circumstance attributable, no doubt, to the fact that fashion has introduced an element which, though elusive and immeasurable, has a well-recognized effect upon values and has interfered with the establishment of standards for judging these commodities based on durability and æsthetic considerations. An expenditure for clothing, for example, unwarranted by health or beauty, may be justified under present conditions of employment by its effect upon the earning capacity of the wearer. It is more difficult, therefore, than in the case of food and shelter to distinguish between necessities and luxuries, and educators have been handicapped in their efforts to organize the subject for teaching purposes.

When household methods of production prevailed, there was an almost universal need among women for training in technical processes—spinning, weaving, sewing, and others—but these were taught by one person to another and formal instruction was almost unknown. With the extension of educational systems to include manual training, courses in sewing and dressmaking were introduced into many schools. These have found favor because, besides training the hand they enrich the general education and are of practical value in the home and as preparation for self-support. Of late, however, need has arisen for the training that enables one to judge of textiles and to understand the hygiene of dress, and this must be based on scientific data. The result is that the subject has been so enlarged on the scientific side that it is finding a place in many colleges and universities. In these institutions, however, the chief emphasis is not upon technique, but upon the historical, scientific, and economic aspects of the subject. Consult: E. H. Richards, *The Cost of Living as Modified by Sanitary Science* (3d ed., New York, 1905); J. M. Matthews, *Textile Fabrics: Their Physical, Microscopical, and Chemical Properties* (2d ed., ib., 1907); Kinne and Cooley, *Clothing and Textiles* (ib., 1913); Woolman and McGowan, *Textiles: A Handbook for the Student and Consumer* (ib., 1913); Barker and Midgely, *Analysis of Woven Fabrics* (ib., 1914). See HOME ECONOMICS and references there given.

TEXTUAL CRITICISM (OF, Fr. *textuel*, from Lat. *textus*, text, composition, fabric, from *texere*, to weave). The criticism of existing texts of literary works with a view to the detection of errors which have crept in, and the restoration of the reading intended by the author. Such criticism may be necessary in the case of any literary production which is no longer under the control of its author, but it

finds its most difficult problems in the Old and New Testaments, the Greek and Latin authors whose works are preserved to us, in the older monuments of the national literatures, and in the texts of some modern writers, e.g., Chaucer and Shakespeare.

The criticism of the texts of Greek and Latin authors, to take them as examples, is based first of all on a careful study and comparison of all existing manuscripts, then on quotations and unconscious reminiscences of the writer in question, in other Greek or Latin authors, and finally on such helps as may be obtained from ancient commentaries, *Scholía* (see *SCHOLLASTS*), or from early translations, such as the Latin and Arabic renderings of certain works of Aristotle. Most classical manuscripts belong to the period from the ninth to the fifteenth century; a few are earlier, one or two possibly as old as the fourth century, and some are later, but ordinarily the manuscripts of the fifteenth and sixteenth centuries are of little or no value. No existing manuscript is free from error. The scribes often did their work mechanically and ignorantly; the blunders thus made were perpetuated and spread by each successive copyist. Such errors may be corrected by comparison with a manuscript which does not contain the identical blunders; but in case all existing manuscripts are descended from the same incorrect original, or archetype, the same errors will probably appear in all. In such case, if the subsidiary aids named above fail, the only resort is to conjectural emendation. Or it may happen that a number of manuscripts have different readings in the same passage, all intelligible. The problem then is to determine which of the several readings is the one intended by the author.

Errors in manuscripts may be divided into: (1) Errors of Omission, (2) Errors of Insertion, (3) Errors of Substitution, (4) Errors of Transposition, (5) Errors of Emendation, (6) Errors due to the Confusion of Letters or Contractions.

(1) *Errors of Omission*.—The simplest form of this class of errors is that known as haplography, when of two identical letters, syllables, or words only one is written; e.g., Plautus, *Miles Gloriosus* 54, *si viverent for sivi viverent*; Vergil, *Georgics*, 4, 311, *magis aera carpunt for magis magis aera carpunt*. The omission of a syllable, word, or passage may also be due to the inexcusable carelessness of the scribe, a failure to understand, a defect in the archetype, etc. Most such omissions come under the head of what is technically known as lipography. Examples are furnished by Vergil, *Aeneid*, 4, 491, *descere for descendere*; 6, 708, *indunt for insidunt*. The omission of clauses or sentences in prose, or of whole lines in poetry, is frequently occasioned by the similar endings of clauses or verses (*homeöteleuton*), or by similar words in the same position within the lines, so that the eye of the scribe jumped from one to the other. In Plautus's *Bacchides*, the oldest manuscript lacks two entire verses, owing to the fact that v. 507 has *atque* and v. 509 *usque* in the same position. The texts of Lucretius and Vergil also furnish examples of this kind of error.

(2) *Errors of Insertion*.—One of the most common forms of this class of errors is that known as dittography, whereby a letter, syllable, or word is written twice. A case of double dittography is furnished by the Palimpsest of Cicero, *De Republica*, 2, 57, *seccvttvseccvts* for

seccutus. Often an explanatory word, gloss, or passage, either interlinear or marginal, is inserted in the body of the text. Thus in Plautus's *Truculentus*, v. 79 is an unmetrical line, *Phronesium, nam phronesis est Sapientia*, which apparently was originally a marginal gloss in explanation of the proper name *Phronesium* in v. 77. Or any marginal note may be incorporated by the scribe, such as *caput*, chapter, *nota*, take notice, *deest*, there is lacking, etc. In some cases insertions have been made with fraudulent intent. There is an ancient tradition that the mention of Athens in the *Iliad*, 2, 533 ff., was interpolated to give the dignity of antiquity to the capital of Attica. Syntactical corrections, both intentional and unintentional, from a difficult to an easier construction are not uncommon; and Renaissance scholars seem often to have been more concerned with making a readable than with making a correct text.

(3) *Errors of Substitution*.—This class of mistakes may arise from various causes. An explanatory gloss may have been substituted for the word it explains, as in Vergil, *Eclogues*, 6, 40, *rara per ignaros errent animalia montis*, where some manuscripts have *rara per ignotos*, etc., *ignotos* being evidently a gloss substituted by some copyist for the correct *ignaros*. In the case of archaic writers like Plautus, a classical word may have ousted the early form; an example is furnished by *Amphitruo*, 631, where one manuscript has the classical *simul* for the archaic *simitu*. The earlier form is correctly given by two manuscripts, while the writer of a fourth first copied correctly *simitu* and then changed it to *simul*. Not infrequently, also, a word has been substituted from the context or from a parallel passage which lingered in the copyist's mind. Further, the mediæval scribes, being monks, might corrupt a passage by substituting a word from a similar passage in the Bible. A famous example is that of Horace, *Odes*, 3, 18, 11, where the monk who was writing a manuscript which afterward became the archetype of a considerable class had in mind Isaiah xi. 6, *habitabit lupus cum agno et pardus cum hædo accubabit*, and so substituted *pardus* for *pagus* in the passage *festus in pratis vacat otioso cum bove pagus*. The most common cause of this class of errors, however, is the confusion of similar words: *addit* and *adit*, *adesse* and *ad sese*, *hospitium* and *hostium*, *precor* and *prætor*, etc.

(4) *Errors of Transposition*.—These errors, whether of letters, syllables, words, or lines, are very common in classical manuscripts. They are due most often to the carelessness of the copyist whose eye traveled faster than his pen. Transposed letters and syllables are easily detected by any one familiar with the language; transposed words are not so readily discovered in prose as in verse, for in verse the transposition usually spoils the metre; so, e.g., the reading of certain manuscripts of Horace, *Odes*, 3, 13, 14, *ternos ter attonitus cyathos petet vates* will not scan, but the metre is perfect when the correct *cyathos attonitus* is read. The transposition of entire lines is generally due to the fact that the copyist carelessly dropped the line or lines, and later, on discovering his error, inserted the missing lines out of place, often without any indication of the misplacement. Lucretius and Vergil furnish many excellent examples. Finally, one or more entire pages may be misplaced either because the scribe carelessly

omitted a page or because the sheets of the archetype had become disturbed before the copy was made. A well-known example of the last is furnished by Lucretius, where the error enabled Lachmann to determine the size of the lost archetype from which the extant manuscripts are descended.

(5) *Errors of Emendation*.—These errors have been touched on under sections 2 and 3. They occur chiefly in manuscripts dating from the ninth century or later, and are especially common in manuscripts written by Renaissance scholars. These errors may arise simply from the wrong division of words, as in Seneca, *Epist.*, 89, 4, where the copyist senselessly divided *quid amet* of his original into *quidam et*. Madvig, by a stroke of the pen, first restored the correct *quid amet*. While Alcuin's efforts to restore Latin orthography were for the most part beneficial, they also led to certain errors, mostly due to the substitution of a familiar for an unfamiliar word, e.g., *facile* for *facete*, etc. Renaissance scholars of the fifteenth and sixteenth centuries not only corrected passages, but also filled out lacunæ, supplied missing scenes, etc.

(6) *Errors Due to the Confusion of Letters and Contractions*.—These mistakes are few in capital and uncial writing, but in minuscule writing the possibilities of the confusion of letters are much greater, and the use of contractions constantly increased with the centuries. A treatment of the subject is impossible here, as it belongs to paleography (q.v.).

Bibliography. For a bibliography of the text criticism of the Bible, see articles on BIBLE, BIBLICAL CRITICISM, ETC. On the text criticism of classical authors, consult Boeckh, *Encyclopædie und Methodologie der philologischen Wissenschaften* (2d ed., Leipzig, 1886); Madvig, *Adversaria Critica*, 3 vols. (Copenhagen, 1871-74); Cobet, *Varie Lectiones* (2d ed., Leyden, 1873); F. Blass in Mueller's *Handbuch der klassischen Altertumswissenschaft*, vol. i (2d ed., Munich, 1892); W. M. Lindsay, *Introduction to Latin Textual Emendation* (London, 1896); H. T. Peck, *A History of Classical Philology* (New York, 1911); F. W. Hall, *A Companion to Classical Texts* (Oxford, 1913); Th. Birt, *Kritik und Hermeneutik nebst Abriss des Antiken Buchwesens* (Munich, 1913); and the best critical editions of the separate authors, such as the edition of Vergil by O. Ribbeck, of Lucretius by Lachmann and Munro, of Horace by Keller and Holder, and of Plautus by Ritschl-Goetz-Löwe-Schoell.

TEYTE, tāt, MAGGIE (1890—). An English-lyric soprano, born in Wolverhampton. Having received her entire musical education under Jean de Reszke in Paris, she made her début at Monte Carlo in 1908 as Zerlina in Mozart's *Don Giovanni*. For the next two years she was a member of the Opéra Comique, where Beecham heard her and engaged her for his first operatic season in London (1910). In 1910-15 she was a member of the Chicago Opera Company and also made extensive concert tours of the States. Her favorite rôles were Mimi in *La Bohème* and Mélisande in *Pelléas et Mélisande*.

TEZUCO, tās-kō'kō, or **TEXCOCO**, tās-kō'kō. A town in the State of Mexico, Mexico, sixteen miles east of the city of that name, east of the Lake of Tezcuco (Map: Mexico, E 8). It is on the Interoceanic Railway, whose shops form its chief industry. It also has glass and cotton manufacture. In the plaza is a monument

to Netzahualcoyotl, the most famous Tezcucan king. Previous to the Spanish conquest the place was occupied by a Chichimeca tribe, known as the Texcucans or Acolhuans, who claimed a preëminence in Nahuatl culture and civilization. Here, in 1521, Cortés built the brigantines with which he besieged Mexico. Pop., 1900, 5930.

TEZIUTLAN, tās'sé-ūt-lān'. A town of the state of Puebla, Mexico, seventy-six miles northeast of Puebla, and thirty-seven miles northwest of Jalapa (Map: Mexico, K 8). Its streets are steep and irregular. It has an extensive commerce with Mexico City and with the towns of Vera Cruz. Pop., (est.) 15,000.

THAALIBI, thā-le'bē (Ar. Abū Maṣṣūr Abd al Malik ibn Muḥammad ibn Ism'īl al Tha'alibī) (961-1038). A prolific writer upon philological and literary subjects. He was a native of Persia, his birthplace being Nishapur, and he represented the Persian-Arabic school of literature. Arabic philology was now passing from the ancient schools of Basra and Kufa to Persian soil. Tha'alibi's great anthology, *Yatimat al dohr*, is an invaluable source of information concerning Moslem poets, and reveals critical judgment as well as erudition. Portions of Tha'alibi's works have been edited in Europe and translated, e.g.: J. Seligman, *Proœmium et Specimen Lexici Synonymici Arabici Atthalibi* (Upsala, 1863); P. Cool, *Selecta ex Thaalebii Libro Facetiarum* (Leyden, 1835); J. Ph. Valetton, *Talibii Syntagma Dictorum Brevium et Acutorum* (Leyden, 1844); Fr. Dieterici, *De Anthologia Arabica Tsaalebii Unio Ætatis Appellata* (Berlin, 1846). Consult: C. Brockelman, *Geschichte der arabischen Litteratur* (Weimar, 1898); R. Nicholson, *Literary History of the Arabs* (New York, 1907).

THACHER, JAMES (1754-1844). An American physician and writer, born in Barnstable, Mass. From 1775 to 1783 he was a surgeon in the Revolution. Afterward he practiced in Plymouth, Mass., until his death. Thatcher is best known through his *Military Journal during the American Revolutionary War* (1823), and *Observations Relative to the Execution of Major John André as a Spy in 1780* (1834). In these books he supported Washington's treatment of André (Thatcher had been stationed at West Point in 1780). Among his medical books was an *American New Dispensatory* (1810; 4th ed., 1821).

THACHER, JOHN BOYD (1847-1909). An American manufacturer, writer, and book collector, born in Ballston, N. Y. He graduated at Williams College in 1869 and settled at Albany, N. Y., where he became a successful manufacturer of car wheels. In 1884-85 he was a Democratic member of the State Senate, taking an especial interest in tenement house reform; and in 1886, 1887, 1896, and 1897 he was mayor of Albany. His publications include: *The Continent of America, Its Discovery and Its Baptism; An Essay on the Nomenclature of the Old Continents*, etc. (1896); a drama, *Charlecoote: or The Trial of William Shakespeare* (1896); *The Cabotian Discovery* (1897); and *Christopher Columbus, His Life, His Works, His Remains, together with an Essay on Peter Martyr of Anghera and Bartolomé de las Casas, the First Historians of America* (2 vols., 1903); an important work, made especially valuable by the publication of many original documents and of various early accounts of the life and voyages of Columbus; *Outlines of the French Revolution told in Autographs* (1905).

THACHER, THOMAS ANTONY (1815-86). An American educator, born in Hartford, Conn. He graduated at Yale in 1835, was appointed tutor there in 1838, and, in 1842, professor of Latin, a position which he held during the remainder of his life. In 1843 he went to Germany and for a time gave instruction in English to the Crown Prince of Prussia and to Prince Frederick Charles. He was one of the editors of *Webster's Dictionary* and also edited many of the Latin classics, such as Cicero's *De Officiis* (1850), and made an English version of Madvig's *Latin Grammar*.

THACK'ERAY, ANNE ISABELLA. See RITCHIE, ANNE ISABELLA.

THACKERAY, WILLIAM MAKEPEACE (1811-63). A famous English novelist. He was born in Calcutta, where his father was at the time in the service of the East India Company, July 18, 1811. At the age of six he was sent to England, his father having died, and placed in the care of an aunt; but in 1821 his mother returned with her second husband and settled near Ottery Saint Mary in Devonshire. The boy regarded her as "a daughter of the gods" and his stepfather, it is asserted, was the original of Colonel Newcome, whom, in certain traits, he did as a matter of fact resemble. After attending two small schools, Thackeray entered Charterhouse, also vividly described in *The Newcomes*, and remained there six years (1822-28). Then he spent a little over a year at Cambridge as a member of Trinity College and of the brilliant society of which Tennyson (q.v.) was one. Then during two years abroad he met Goethe at Weimar. On his return to England he studied law for a while at the Middle Temple, which furnished material for *Pendennis*. On his coming of age, he inherited a fortune of now indeterminate size, but variously estimated at £20,000 and £500. At all events, much of it was lost by the failure of an Indian bank, and a quantum of it at play, and he had to depend on his own exertions for a living. In 1833 he became editor and proprietor of the *National Standard*, a periodical devoted to art and literature, but it lived only about a year, after which he spent some time in Paris studying art. He offered to illustrate *Pickwick*, but his services were declined by Dickens. In 1836 he became Paris correspondent for the *Constitutional*, and married there Isabella, daughter of Colonel Shawe of Doneraile, County Cork.

After his marriage he settled in London and contributed regularly to *Fraser's Magazine*, and was busy with his pencil also. His first book was *Flore et Zéphyre* by Théophile Wagstaff (1836), with nine comic plates from his own drawings. To *Fraser's* he contributed *The Yellowplush Papers* in 1838. Then followed *The Paris Sketchbook* (1840), and *The Irish Sketchbook* (1843). In 1842 he began writing for *Punch*, to which he contributed nearly four hundred sketches. The most successful were "Jeames's Diary" (1845-46), the "Prize Novelists" (1847), and the "Snob Papers" (1846-47). Thackeray had now proved himself a master of burlesque, and an acute critic of contemporary manners. In their kind nothing could be better than the "Prize Novelists," in which he exaggerates the weaknesses of Bulwer, Disraeli, Lever, Cooper, and Scott. *Barry Lyndon* (1844) was slow in winning the recognition which later criticism has given it in justly declaring it to be, in the concentrated power of its satire, in its

literary economy and in other literary qualities one of his very finest achievements. He had also begun, as he continued throughout life, to write occasional verse, commonly in the ballad measure, at will grave and pathetic or richly humorous.

In 1847-48 *Vanity Fair* appeared in monthly parts, and Thackeray assumed his place in English literature by the side of Fielding. This, with his other great novels, *Pendennis* (1848-50), *Henry Esmond* (1852), and *The Newcomes* (1853-55), shows him at the height of his power. Like *Vanity Fair*, the last three named novels appeared in monthly installments. Somewhat inferior, but still to be mentioned in this context, are *The Virginians* (in monthly parts (1857-59) and *The Adventures of Philip* (1862). *Henry Esmond*, especially, has taken rank by universal consent at the head of English historical fiction. With its other merits, it is on the whole a wonderfully faithful reproduction, not only of the language, but of the thought and the manners of the early eighteenth century. This was a period by which Thackeray was always strongly attracted; Addison, Swift, Steele, and the eighteenth-century novelists were his masters in literature. He even thought of writing a history of the century; and his studies took shape in the delightful lectures on *The English Humorists*. These he delivered in America in 1852 and 1853 with such success that he came again in 1855 with *The Four Georges*. In 1857 he tried for Parliament, standing for Oxford in the Liberal interests, but was fortunately defeated. In 1860 he became the first editor of the *Cornhill Magazine*, for which he wrote his last novels, *Lovel the Widower* (1860), *The Adventures of Philip* (1862), and the beautifully written *Denis Duval* (1864). In the *Cornhill* appeared (1860-63) the *Roundabout Papers*, models of the familiar essay, which represent his style in its ripest perfection.

Though not far beyond middle life, Thackeray felt the burden of years, and resigned the editorship of the *Cornhill* in April, 1862. On the morning of Dec. 24, 1863, he was found dead in his bed. He was admirable both as a man and as a novelist. Tennyson called him lovable and noble-hearted. So said Carlyle and all who knew him well. He has been often called a cynic; and indeed he was unsparing in the fierceness with which he plied the lash on anything which savored of sham or pretense, and his keen vision detected alloy in the finest natures. Yet there is a tremendous contrast between his satire and that of Swift, a cynic in truth, who hated and despised human nature and rejoiced in laying bare its weaknesses. Thackeray wrote always with a noble tenderness and with reverence for all that was good and true. Yet it must be admitted that, almost without exception, the strongest characters in his novels are the bad ones, and that he has drawn scarcely a woman whom we can love and admire without qualification.

Thackeray described the life of the upper classes, with its fringe of servants and retainers, as Dickens that of the lower; and between them they give an unrivaled picture of English life in the middle of the nineteenth century, with its characteristic notes, one may say, for the first time in the history of literature, a picture of a society whose chief concern is the making or the spending of money. The interest in social questions which he was among the first to import

into fiction has never died out; though Charlotte Brontë's enthusiastic picture of him (in the preface to the second edition of *Jane Eyre*) as a prophet who comes before the great ones of society much as the son of Imlah came before the throned kings of Judah and Israel, and who speaks truth as deep, with a power as prophetic-like and as vital, a mien as dauntless and as daring, may seem to us overdrawn. The most indisputable of his qualities is his mastery of a singularly pure, flexible, varied, and simple style—the natural unstrained expression of his thoughts, however lofty or however homely they may have been. "He blew on his pipe, and words came tripping round him, like children, like pretty little children who are perfectly drilled for the dance; or came, did he will it, treading in their precedence, like kings, gloomily."

Bibliography. Out of respect for Thackeray's request, no authorized biography of him has ever been written. His daughter, Mrs. Richmond Ritchie, however, has written sketches for each volume of the Biographical Edition of his works (London, 1898-99), and his son-in-law, Sir Leslie Stephen, wrote the excellent article on him in the *Dictionary of National Biography*. A good edition of the *Works* is that with introduction by Walter Jerrold (New York, 1902). Anthony Trollope's *Thackeray*, in the "English Men of Letters Series" (London, 1879), is interesting on the score of a few personal impressions, but on the whole unsatisfactory and unworthy of its subject. See also: Lewis Melville, *Life* (London, 1899), and L. S. Benjamin, *Life* (2 vols., New York, 1906). For early work, not found in the Biographical Edition, see *Unidentified Contributions of Thackeray to Punch*, edited by Spielmann (ib., 1899), and Thackeray's *Stray Papers*, 1821 to 1847, edited by Melville (ib., 1901). Consult also Hunter, *The Thackerays in India* (ib., 1897); the biography by Merivale and Marzials in the "Great Writers Series" (ib., 1891); Whibley (ib., 1903); Crowe, *Homes and Haunts of Thackeray* (ib., 1897); id., *With Thackeray in America* (ib., 1893); Wilson, *Thackeray in the United States* (New York, 1904). For criticism, consult especially the essays by Harrison, in *Early Victorian Literature* (London, 1895); Brownell, in *Victorian Prose Masters* (New York, 1901); Scudder, *Social Ideals in English Letters* (Boston, 1898); Lilly, in *Four English Humorists of the Nineteenth Century* (London, 1895); Skelton, *Table Talk of Shirley* (ib., 1895); Melville, *Thackeray Country* (New York, 1905); L. S. Benjamin, *Some Aspects of Thackeray* (Boston, 1911).

THADDÆUS, thād-dē'ūs (Gk. Θαδδαῖος, *Thaddaios*, a name of uncertain derivation and meaning). One of the 12 Apostles in the list given in Mark iii. 16-19 and Matt. x. 2-4 (authorized version, "Lebbæus"). In the corresponding lists in Luke vi. 14-16 and Acts i. 14 he is named Judas [son] of James, doubtless to distinguish him from Judas Iscariot. As so named he may be the Judas referred to in John xiv. 22. Some inferior manuscripts in the lists of Mark and Matthew substitute Lebbæus for Thaddæus, a reading possibly due to some scribe who, ignorant of the identity of Levi with Matthew, introduced the former into the apostolic list under this name (cf. Origen, *Contra Celsum*, i. 62, where *Lebēs* is used as the equivalent of *Levein* [Levi]). Eusebius (*Hist. Eccles.* i. 13) makes Thaddæus one of the Seventy, and refers to him as sent by Thomas the apostle to Abgar, King

of Edessa, in fulfilment of a promise of Christ to him to heal him of an incurable disease and to evangelize his household. Eusebius claims to have taken this story direct from Syrian sources. In the Greek *Acts of Thaddæus* he is identified with Lebbæus, and referred to as evangelizing Syrians and Armenians. The Syrian tradition embodied in the *Doctrine of Addai* makes Addai, one of the Seventy, the apostle of the Syrian church.

THAD'DEUS OF WARSAW. A romance by Jane Porter (1803).

THAER, tär, ALBRECHT DANIEL (1752-1828). A noted German agriculturist, whose work revolutionized certain forms of farm management and animal production of his day. Born at Celle, Hanover, he was trained as a physician, but early turned his attention to agriculture. On his farm in Celle he demonstrated the value of intensive farming, stall feeding of soiling crops, and rotation of crops in connection with potato culture. He was active in applying scientific principles to agriculture, systematizing accounts, introducing agricultural implements, and improving sheep for the production of fine wool. In 1802 he began a course of agricultural lectures, out of which grew the Agricultural Institute of Celle. In 1806 he established at Möglin, near Berlin, an agricultural institute, which became celebrated. He was appointed professor at the University of Berlin in 1810, started his famous sheep-breeding farm at Möglin in 1811, and from 1815 on had charge of the royal sheep-breeding farms, which he improved. Resigning his professorship in 1818, he devoted himself to his institute at Möglin, which was raised to a Royal Academy of Agriculture in 1824. Thaer founded and edited the *Annalen der niedersächsischen Landwirtschaft* (1798-1804), and was the author of a large number of treatises on agriculture, several of which were epoch-making. The *Einleitung zur Kenntnis der englischen Landwirtschaft* (1798; 3d ed., 1816) made his name first more widely known, and his great work *Grundsätze der rationellen Landwirtschaft* (1809-10; new ed., 1880) was translated into most of the European languages. For his biography, consult Kürte (Leipzig, 1839).

THAI, tã'ê, or **TAI** (free). A group of peoples of Farther India, including the Thos (q.v.) and Muongs (q.v.) in the northeast (Tongking and China), the Shans (q.v.) in the northwest (Burma, Siam, China), the Laotians (see LAOS) in the south (the Laos States, French Siam), and the Siamese in the southwest (Siam). The term Thai is applied by certain writers to the Siamese in particular, but their proper appellation is rather Little Thai, their ancestors, the Shans, being called the Great Thai. The Thai peoples speak languages belonging to the same linguistic stock. The Siamese present the Thai type, much changed by intermixture with Khmers, Hindus, Kuis, Malays, and other stocks. They are of medium stature and brachycephalic, while the Laotians are shorter and less broadheaded. Among some of the Shan tribes the primitive Thai type is best preserved. The Thai peoples have shown much political capacity. Consult: Pellegrin, *Description du royaume Thai ou Siam* (Paris, 1854); Bastian, *Die Völker des östlichen Asiens* (Leipzig, 1866); Hellwald, *Hindereindische Länder und Völker* (ib., 1880); Forbes, *Comparative Grammar of the Languages of Further India* (London, 1881); Colquhoun, *Across Chryse* (ib., 1883); Diguët, *Etude de la*

langue Tai (Paris, 1896). See CHINA, *Ethnology*.

THAIS, thā'is (Lat., from Gk. *Θαïs*). An Athenian courtesan, famous for wit and beauty. She accompanied Alexander the Great to Asia, and, according to Cleitarchus, induced him, during a festival, to set fire to the palace of the Persian kings at Persepolis (compare Dryden, *Ode to Saint Cecilia's Day*). After the death of Alexander she lived with Ptolemy Lagi, King of Egypt, who is said (by Athenæus) to have married her, and by whom she gave birth to two sons, Leontiscus and Lagus, and a daughter, Irene.

THAIS. An opera by Massenet (q.v.), first produced in Paris, March 16, 1894; in the United States, Nov. 24, 1907 (New York).

THAKURA. See TAGORE, SIR R.

THALBERG, täl'bërk, SIGISMUND (1812-71). A German pianist, born at Geneva, Switzerland. He was the natural son of Prince Moritz Dietrichstein and received his musical education from 1822 on at Vienna, where he studied under Hummel and composition under Sechter. His appearance in public in 1830 was a success, and he became chamber virtuoso to the Emperor of Austria in 1834, appearing in Paris (1835) as a rival of Liszt. After triumphs in England, Russia, and Italy, in Brazil (1855-56), and in the United States (1856-58), he retired to his home at Posilipo, near Naples, whence he only once more undertook a concert tour to Paris and London (1862) and to Brazil (1863). Perhaps his strongest point as a pianist was his mastery of the legato singing tone. In every other respect his style, though brilliant, was shallow.

THALER, tä'lër. A German coin, first struck at Joachimsthal, Bohemia, in 1519 and hence called Joachimsthaler, whence the modern name. The thaler, divided into 30 silbergroschen of 12 pfennigs, was the German unit of value until 1873, when the mark was adopted. The thaler is still in circulation with the value of 3 marks, about 69 cents. See Plate II of NUMISMATICS.

THALES, thäl'ëz (Lat., from Gk. *Θαλῆς*). The earliest of the Greek philosophers, and the founder of the Ionic or Physical school. (See IONIAN SCHOOL.) He flourished in the first half of the sixth century B.C. He was a native of Miletus, in Asia Minor, and is said to have been of Phœnician descent. He was reckoned one of the Seven Wise Men (q.v.), possessed sufficient astronomical knowledge to enable him to predict the eclipse of the sun in the reign of the Lydian King Alyattes, and was an excellent mathematician. He was famed also for his practical and political wisdom, but especially because he was the first among the Greeks to set aside the current explanations of the universe and look for a first principle (*ἀρχή*) which might be grasped through reason. This first principle he found in water, the source of all things, into which, also, all things were resolved. Thales left no writings, and even among the Greeks considerable doubt prevailed as to his exact teachings. Consult: Zeller, *Philosophie der Griechen*, vol. i (4th ed., Berlin, 1900); James Burnet, "From Thales to Plato," in *Greek Philosophy*, part i (London, 1914); Ritter and Preller, *Historia Philosophiæ Græcæ* (9th ed., Gotha, 1914).

THALYA (Lat., from Gk. *Θάλεια*, *Thaleia*, from *θάλεια*, *thaleia*, luxuriant, blooming, from *θάλλειν*, *thallein*, to bloom). One of the nine Muses (q.v.). In the assignment of specific functions to the Muses she became the Muse of

Comedy, and was represented as holding the comic mask.

THALLINE, thäl'in or -ën. A synthetic drug derived from coal tar. As thalline salicylate it is employed as an intestinal antiseptic and in rheumatism; as thalline sulphate it is used as an antiseptic and antipyretic and has been suggested as a substitute for antipyrine, but its effects are not so lasting, nor is the drug without danger.

THALLIUM (Neo-Lat., from Gk. *θαλλός*, *thallos*, green shoot). A metallic element discovered by Crookes in 1861, and independently by Lamy in 1862. It was originally found by the bright green line which its compounds give when examined by the spectroscope. It occurs as the selenide in combination with copper and silver, in the rare mineral *crookesite*, in small quantities in copper and iron pyrites, and in the seleniferous deposits from sulphuric acid; also in minute quantities in other minerals, and in certain mineral waters. It may be prepared from the flue dust of sulphuric acid works in which pyrites containing thallium are burned, by heating the dust with water acidulated with sulphuric acid, precipitating the resulting solution with hydrochloric acid, heating the precipitate to dryness with sulphuric acid, dissolving the resulting thallium sulphate in water, and precipitating the metallic thallium by zinc. Thallium (symbol, Tl; atomic weight, 204.0) is a soft, crystalline, leadlike metal, with a specific gravity of 11.9, and a melting point of 290° C. (554° F.). When exposed to the air it tarnishes rapidly, becoming coated with a thin layer of oxide, which preserves the rest of the metal. It combines with oxygen to form a monoxide (Tl₂O) and a trioxide (Tl₂O₃), which yield corresponding series of salts, known as the thalloses and thallic compounds. The compounds of thallium are very poisonous, producing symptoms like those of lead poisoning. Their presence in a given substance may be readily detected by the beautiful green color which they impart to a nonluminous gas flame.

THALLOPHYTES (from Gk. *θαλλός*, *thallos*, green shoot, from *θάλλειν*, *thallein*, to bloom + *φυτόν*, *phyton*, plant). One of the four great divisions of the plant kingdom, containing the algæ and fungi (qq.v.). In theory the thallophytes are distinguished from the other groups by having a thallus body. As a matter of fact, there are many thallophytes with upright stemlike axes, rootlike regions of attachment, and lateral members which function as and resemble leaves, although not at all homologous with the leaves of higher plants. The best examples of these are found among the Phæophyceæ, Rhodophyceæ, and Charales (qq.v.). The thallophytes are readily distinguished from the bryophytes above them by the absence of the peculiar female sexual organ (archegonium, q.v.), and the sexless phase or plant (sporophyte, q.v.) characteristic of the bryophytes and pteridophytes. They are, therefore, defined more through the absence of structures found in the higher plants than by any agreement among themselves.

THALLUS (Lat., from Gk. *θαλλός*, green shoot). A plant body whose vegetative structure is not differentiated into such organs as stem, leaf, etc. Most of the algæ and fungi (thallophytes, q.v.) have thallus bodies. Many liverworts, the sexual phase (gametophyte) of ferns, and even certain reduced and simplified flowering plants such as the duckweed (*Lemna*),

present a thalloid structure. On the other hand, certain thallophytes, especially among the brown and red algae, have bodies differentiated far beyond the limits of the definition of a thallus.

THAMES, tēmz. The most important river in Great Britain, flowing with a southeastern trend through the southern portion of the Kingdom and passing through London (Map: England, G 5). Its headwaters, rising on the southeast slope of the Cotswold Hills, in Gloucester, five miles south of Cheltenham, converge on Oxford and flow thence in a southeasterly direction to Reading, through a gap in the Chiltern escarpment. The Thames thereafter follows a generally eastward trend. A few miles below Gravesend it expands into a wide estuary, and enters the North Sea. Its length is about 215 miles. The upper part of the river is sometimes called the Isis. At London Bridge the width of the river is about 290 yards; at Woolwich, 490 yards; at Gravesend pier, 800 yards; 3 miles below Gravesend, 1290 yards; at Nore Light, 6 miles; and at its mouth, between Whitstable and Foulness Point, about 8 miles below the Nore, the estuary is 18 miles across. The river is navigable for barges to Lechlade, upward of 200 miles above its mouth, and it is connected with several important canals, affording communication with the west and south coasts, and with the interior of the country. Its upper reaches and islands are much resorted to for their sylvan beauty, and pleasure steamers ply daily between Kingston, Henley, and Oxford. The London docks now embrace 35 miles of the river from the Tower Bridge to Tilbury Dock and the largest steamships are moored at these docks. While the upriver docks are tidal, the lower ones admit any vessel at any stage of the tide. On the average a vessel arrives at the port of London every 10 minutes. The Thames is also the main source of the water supply of London, the daily supply delivered exceeding 225,000,000 gallons. The part of the river immediately below London Bridge is called the Pool, and the part between the bridge and Blackwall is called the Port. Two embankments have been formed, one on the north shore from Blackfriars Bridge to Westminster, and one on the south shore from Westminster Bridge to Vauxhall. Among the places on the Thames besides those above mentioned are Windsor, Eton, and Richmond. Consult: H. W. Wack, *In Thamesland* (New York, 1906); T. R. Way, *The Thames from Chelsea to the Nore* (ib., 1907); Hilaire Belloc, *Historic Thames* (ib., 1907); T. H. M. Howe, *The Thames* (ib., 1911); G. E. Mitton, *The Thames* (ib., 1914). See LONDON.

THAMES, tēmz, or **GRAHAMSTOWN**. A gold-mining town on the east coast of the Firth of Thames, an inlet in the Hauraki Gulf, North Island, New Zealand, 40 miles east-southeast of Auckland (Map: New Zealand, N., B 4). Pop., 1911, 4104.

THAMES, tēmz, locally, also thāmz, tāmz. A river of eastern Connecticut (Map: Connecticut, G 4). It is a broad and navigable tidal estuary, 15 miles long, receiving the Shetucket, and entering Long Island Sound at its eastern end. At its mouth stands New London, and at its head Norwich. The Shetucket and its branches supply power for considerable manufactures.

THAMES, BATTLE OF THE. A battle fought at the Moravian settlement on the Thames River in the township of Oxford, Ontario, Canada, on Oct. 5, 1813, during the War of 1812, between an American force of about 3000 (largely Kentucky

volunteers) under Gen. William H. Harrison and a British force of about 650 under General Proctor, aided by a force of Indians, whose number has been variously estimated at from 800 to 2000, under Tecumseh. For days Proctor had retreated before Harrison, but had at last decided to give battle and had drawn up his troops to receive the advancing Americans. The battle was begun and virtually decided by a cavalry charge under Col. Richard M. Johnson, who has been credited with having personally killed Tecumseh. The British broke, and fled from the field, with Proctor at their head; the only serious resistance was that of the Indians. The American loss in killed and wounded was reported by Harrison as 29; that of the British was about 35, a large number being taken prisoners. The Indian loss is not definitely known, but it does not appear to have been large. Proctor was soon afterward disgraced for his conduct during the battle. Johnson contended that the battle was fought and won by his regiment of mounted Kentuckians. By this battle the right division of the British army in Upper Canada was greatly weakened, and as the result of Tecumseh's death the powerful Indian confederacy in the Northwest against the United States was broken up.

THAMES EMBANKMENT. An important public work in London consisting of broad roads along the Thames, protected on the river side by massive granite walls. The finest portion, the Victoria Embankment, on the north bank of the river, between Blackfriars Bridge and Westminster, was constructed in 1864-1870. It has a carriageway 64 feet wide, flanked by broad footwalks, and is planted with trees and adorned with gardens containing statues of notable men. The obelisk known as Cleopatra's Needle stands near the Adelphi Steps. The Albert Embankment on the right bank, between Westminster Bridge and Vauxhall Bridge, with a 60-foot roadway, was completed in 1869, and the Chelsea Embankment, on the left bank, in 1873.

THAMUGADI. Another name for Tim-gad (q.v.).

THAM'YRIS (Lat., from Gk. Θάμυρις). A Thracian bard who challenged the Muses to a contest of singing. He was overcome by them and as a punishment was blinded and deprived of his gift of song.

THAN'ATOP'SIS (Neo-Lat., from Gk. θάνατος, *thanatos*, death + *opsis*, sight, view). A well-known poem by William Cullen Bryant, written in 1811, and published in 1817.

THAN'ATOS (Gk. θάνατος, death). The Greek god of death, called by the Romans *Mors*, and twin brother of Sleep (see *SOMNUS*), with whom he is usually represented.

THANE (AS. *þegen*, *þegn*, OHG. *degan*, attendant, servant, soldier, Ger. *Degen*, heroic warrior), or **THEGN**. The name by which the class of minor nobles was known in Anglo-Saxon times. Any freeman who had acquired five hides of land and a special appointment in the King's hall became a thane. He was bound to service in war, but was protected by a higher wergild (q.v.) than the ordinary freeman. Like the *gesith*, who was the noble living with the King, the thane was a development from the Germanic *comitatus* or noble follower of some chief, described by Tacitus. After the Norman Conquest the thanes were merged in the class of knights. In Scotland, however, it was long used as a designation of high rank, e.g., the chief of a clan.

Consult Sir William Stubbs, *Constitutional History of England*, vol. i (6th ed., Oxford, 1897).

THANE OF CAWDOR. See CAWDOR.

THAN'ET, ISLE OF. The northeast corner of Kent (q.v.), England (Map: England, H 5). It is 8 miles in length and from 4 to 6 in breadth. Agriculture is successfully pursued. It contains the well-known watering places, Ramsgate, Margate, Westgate, and Broadstairs. Pop., 1901, 68,350; 1911, 72,574. Consult Simson, *Historie Thanet* (London, 1891).

THANET, OCTAVE. See FRENCH, ALICE.

THANKSGIVING DAY. In America, the name of a national holiday, which originated in New England. After the first harvest of the New England colonists in 1621 Governor Bradford made provision for a day of thanksgiving and prayer. In 1623 a day of fasting and prayer in the midst of drought was changed into thanksgiving by the coming of rain during the prayers; gradually the custom prevailed of appointing thanksgiving annually after harvest. These appointments were by proclamation of the Governors of the several New England Colonies. During the Revolution a day of national thanksgiving was annually recommended by Congress. In 1817 New York adopted it as an annual custom, and it spread through many of the States by the middle of the nineteenth century. In 1864 President Lincoln appointed a day of thanksgiving, and since then the presidents have issued a Thanksgiving proclamation, generally designating the last Thursday of November. The memory of its origin as a State appointment survives in the proclamations of the governors of the States, which follow that of the president. Consult Love, *The Fast and Thanksgiving Days of New England* (New York, 1895).

THAR, thār (East Indian name), or TAHR. A goat antelope (*Hemitragus jemlaicus*) allied to the Nilgiri goat (see NILGAR), which inhabits the higher forest regions of the southwestern Himalayas. It is about 3½ feet tall. It is usually dark brown, but variable, and lighter in winter. The female is singular in having four teats. The horns are black and bend backward. This species is known in Kashmir as kras, and in Nepal as jharal. See Plate of GOAT ANTELOPES.

THARAUD, tá'rô', JÉRÔME (1874-) and JEAN (1877-). French novelists, brothers, both born at St. Julien. Their literary partnership was so close that when they signed their joint work "J. J." it was impossible to distinguish between them. (For similar collaborations, see articles on the brothers GONCOURT, MARGUERITE, and ROSNY.) The Tharauds were awarded the Goncourt prize in 1906. They wrote: *Le coltineur débile* (1899); *La lumière* (1900); *La légende de la Vierge and Dingley, l'illustre écrivain* (both 1902); *Contes de la Vierge, Les moines de l'Athos, and Les hobereaux* (all 1904); *La ville et les champs* (1906); *Bar cochebas* (1907); *La maîtresse servante* (1911); *La fête arabe* (1912); *La tragédie de Ravallac* (1913); *La bataille de Scutari et d'Albani* (1913).

THA'SOS (Lat., from Gk. Θάσος). The most northerly island in the Ægean Sea, a few miles off the coast of Macedonia (Map: Greece, F 3). Circumference, about 40 miles; pop., 1914, according to Baedeker, about 12,000, mostly Greeks, scattered over 8 villages. Thasos is mountainous, the chief summit, Hypsarion, being about 3400 feet in height, and is, on the whole, barren.

It exports some oil, honey, wax, and timber. The island seems to have been the seat of a Phœnician trading post in very early times, but near the end of the eighth century B.C. it was colonized by Parians. The settlers had a severe struggle with the natives before possessing the island and its rich gold mines. They later reached the neighboring coast, where gold was also found, and became very wealthy. Thasos submitted to the Persians, but after the defeat of Xerxes joined the Delian League. After an attempt to revolt, it was reduced by the Athenians, who held it for most of the time until the end of the third century B.C., when it passed into the hands of Macedonia. After the battle of Cynoscephalæ (197 B.C.) Thasos long enjoyed autonomy under the Romans. Consult: Conze, *Reisen auf den Inseln des thrakischen Meeres* (Hannover, 1860); H. F. Tozer, *Islands of the Ægean* (Oxford, 1890); Jacobs, *Thasiaca* (Göttingen, 1893); J. Baker-Penroye, in *Journal of Hellenic Studies*, vol. xxix (London, 1909); K. Baedeker, *Konstantinopel, Balkanstaaten, Kleinasien, Archipel, Cypern* (2d ed., Leipzig, 1914).

THATCH, EDWARD. See TEACH, EDWARD.

THATCH'ER, HENRY KNOX (1806-80). An American naval officer, born at Montpelier, near Thomaston, Me. He entered the navy as a midshipman in 1823; rose through successive grades to the rank of commodore in 1862 and to that of rear admiral in 1866. In 1862 he was placed in command of the steam frigate *Colorado*, with which he joined the North Atlantic Squadron. In December, 1864, and January, 1865, he commanded the first division of Admiral David D. Porter's fleet in the attacks upon Fort Fisher, and showed so much ability that he was soon afterward appointed acting rear admiral and assigned to succeed Farragut in command of the West Gulf Squadron. In coöperation with Major General Canby he then besieged and captured the city of Mobile with its remaining fortifications and the fleet of Confederate ironclads. Soon afterward he occupied Galveston without opposition, and so completed the conquest of the Gulf coast. In 1866 he was given command of the North Pacific Squadron, a position which he held until 1868, when he was placed upon the retired list.

THAU. See AMBOINA.

THAULOW, tou'lov, FRITS (1847-1906). A Norwegian landscape painter. He was born in Christiania and studied at the Copenhagen Academy and under Gude at Karlsruhe. On his return to Norway he joined the new movement in art and about 1880 removed to Paris. His favorite subjects were running water, snow scenes, and nocturnes, which he interpreted with truthfulness and rare poetic charm. Fine examples are "A November Day in Normandy" (National Gallery, Berlin) and "Winter in Normandy" (Luxembourg, Paris). Other works are in the museums of Munich, Stockholm, and Christiania. He held many exhibitions in the United States, where he is very well represented in private collections, such as the Walters collection, Baltimore, and that of ex-senator Clark, New York.

THAU'MATUR'GUS. See GREGORY THAUMATAURGUS, SAINT.

THAUMATURGY, thā'má-tūr'jī. See LEGER-DEMAIN.

THAÛN, tá'en', PHILIPPE DE (fl. c.1100-c.1135). The earliest Anglo-Norman poet whose work has come down to us. Little is known of him. He probably belonged to a family near

Caen, France, whence he went to England. He wrote "Li Cumpoz," or "Computus," the so-called "Livre des Créatures," about 1115. It is a poetical treatise in six-syllabled lines on the ecclesiastical calendar. Of its seven manuscripts three are in the British Museum and three in the Vatican. More important is "Li Bestiare," or "Physiologus," which the poet probably composed about 10 years later. It was dedicated to Adelaide, Queen of Henry I. But one manuscript has survived, viz., Cotton, Vespasian, E. x. It contains 3194 verses, consists of lines of six and eight syllables, and rhymes in couplets. It is the first French bestiary based on the Latin Physiologus, one of the most noteworthy of the bestiaries (q.v.). Philippe groups his creatures as beasts, birds, and stones, and treats each creature as a symbol. His allegories are in general naïve; those of a dove and the pelican are not without beauty. He is more valuable for his linguistic legacy in connection with the *langue d'oïl* than for his poetic talents, which were in fact poor. Consult Mall, *Li Cumpoz de Philippe de Thain* (Strassburg, 1873), and Valberg, *Le bestiaire de Philippe du Thain* (Paris, 1900).

THAUSING, tou'sing, MORITZ (1838-84). An Austrian art historian. He was born near Leitmeritz, Bohemia. He studied history and Germanic philology at the universities of Prague, Vienna, and Munich, and in 1868 became curator of the Archduke Albert's collection of drawings and engravings in the Albertina, Vienna. In 1873 he was called to the University of Vienna as professor of art history. Thausing was an able pioneer in research on Albrecht Dürer. His chief works are: *Dürers Briefe, Tagebücher, und Reime* (1872); *Dürer: Geschichte seines Lebens und seiner Kunst* (2d ed., 1884).

THAW CASE. A criminal trial remarkable for the tenacity with which the issue of insanity was contested. On June 25, 1906, Harry Kendall Thaw of Pittsburgh, son of William and Mary Copley Thaw, shot and killed Stanford White (q.v.), a leading architect of New York City, at Madison Square Roof Garden. Occurrences preceding the murder involved Evelyn Nesbit, an actress and artist's model, whom Thaw had married. Thaw was indicted for murder, first degree, in January, 1907, his trial beginning Jan. 22, 1907. William Travers Jerome (q.v.), district attorney, prosecuted the action and insisted upon having Thaw examined as to his sanity, despite the defendant's opposition. The commission which examined Thaw pronounced him sane, and the trial continued. The testimony introduced was of a highly sensational nature. The jury disagreed and was discharged, certain members refusing to convict because of belief that an unwritten law was applicable. Thaw was again brought to trial in the following January (1908). It was in this trial that the terms "brainstorm" and "dementia Americana" were first employed—the former to indicate sudden, impulsive insanity, and the latter, as used by Delphin Delmas, Thaw's counsel, to describe a kind of righteous frenzy. Acquitted on the ground that he was insane when he killed White, Thaw was committed to Matteawan State Hospital for the Criminal Insane, the order of commitment providing, as usual, that he should continue in restraint until discharged by due course of law.

Immediately after entering Matteawan, Thaw obtained a writ of habeas corpus to determine

whether his confinement was legal. The superintendent of the asylum opposed Thaw's release, and Jerome again appeared for the State. After several hearings this writ was dismissed on May 25, 1908, the presiding justice holding that Thaw's release would be dangerous to the public. In June an application made by Thaw for his transfer to Middletown State Hospital was denied, but in the same month he demanded a jury trial to prove his sanity. When the United States Supreme Court finally refused to review the action of the State court, refusing Thaw's application, this long proceeding was closed. The second writ of habeas corpus was dismissed Aug. 12, 1909, the third was dismissed July 26, 1912, and the fourth (issued March 1, 1913) was later withdrawn, on the ground that the scandal resulting from the Anlut incident had prejudiced Thaw's case. In November, 1912, Thaw had given John N. Anlut, a New York lawyer, \$25,000 to influence the superintendent of Matteawan to procure his release. Thaw disclosed this in the criminal prosecution resulting from the bribery and later cited the value of his testimony in this action as substantiating his claim to sanity. Several legal proceedings with reference to the application of the rules and regulations of the hospital were brought during Thaw's stay at Matteawan. His right to consult with counsel unattended by guards and the number and length of visits by strangers were diligently litigated.

Thaw escaped from Matteawan, Aug. 17, 1913, in a motor car and succeeded in reaching Canada. Under deportation proceedings he returned across the border to New Hampshire. An indictment, charging him with conspiracy in effecting his escape from confinement, was unsuccessfully brought, but the State of New York, after strenuous opposition, succeeded in procuring his return to its jurisdiction on the ground that he was a fugitive from justice. The extradition proceedings, finally carried on appeal to the United States Supreme Court, were upheld by it. Brought to trial on the conspiracy charge, Thaw was acquitted by a jury and was thereupon ordered back into custody at Matteawan. On March 15, 1915, the fifth and final writ of habeas corpus was issued, and on July 16 the jury returned its verdict that Thaw was sane, thereby releasing him from custody. For a history of the Thaw case to the date of Thaw's escape from Matteawan, consult the *New York Times* of Aug. 18, 1913.

THAXTER, CELIA (LAUGHTON) (1836-94). An American poet, born at Portsmouth, N. H. Her father was keeper of the United States Government lighthouse on the Isles of Shoals, where her girlhood and much of her after life were passed. In 1851 she married Levi Lincoln Thaxter, a Browning scholar. Mrs. Thaxter's poetry was reflective of her quiet life on the islands. It expressed with simplicity and delicacy her feeling for the sea and its perils, and also for the gentler aspects of nature. Her works include: *Poems* (1871); *Among the Isles of Shoals* (1873), a series of papers begun in the *Atlantic Monthly* in 1867; *Drift-Weed* (1878); *Poems for Children* (1884); *The Cruise of the Mystery, and Other Poems* (1886); *Idyls and Pastorals* (1886); *The Yule Log* (1889); *An Island Garden* (1894); *Stories and Poems for Children* (1895). For her son, see THAXTER, ROLAND.

THAXTER, ROLAND (1858-). An American botanist. He was born at Newton,

Mass., son of Celia Thaxter (q.v.), and was educated at Harvard (A.B., 1882; Ph.D., 1888), where he was an assistant in biology in 1886-88, assistant professor of cryptogamic botany from 1891 to 1901, and thenceforth professor. In the meantime he had served as mycologist of the Connecticut Agricultural Experiment Station from 1885 to 1891. In 1907 he became the American editor of the *Annals of Botany*, an important English series, and in 1909 was president of the Botanical Society. He was elected to the National Academy of Sciences in 1912. Thaxter contributed many monographs to scientific publications, dealing particularly with the fungous diseases of insects and with cryptogamic botany.

THAYER, ABBOTT HANDERSON (1849-1921). An American figure, landscape, and portrait painter. He was born in Boston, Mass., and from 1875 to 1879 studied at the Beaux-Arts, Paris, under Gérôme and Lehmann, but was most influenced by the work of Bastien-Lepage. Upon his return to the United States he at first painted portraits and occasional landscapes, but soon devoted himself to ideal figure compositions. His highly individual style is characterized by broad draftsmanship, well balanced composition, and the use of color in simple strong masses. His favorite subject is a young female figure, alone or in company with one or two accessory figures, frequently members of the artist's family. They are treated with much ideality, and great dignity and charm of expression. Fine examples of his work are: "Young Woman" (Metropolitan Museum, New York); "Caritas" (Boston Museum); "Winged Figure" (Albright Art Gallery, Buffalo); "A Virgin" (Freer collection, National Gallery, Washington, which also possesses several other works), and "Virgin Enthroned." In 1884 he executed a mural decoration, "Florence," for Bowdoin College. He was an original member, and for two years president of the Society of American Artists, and was elected a member of the National Academy (1901), and of the American Academy of Arts and Letters. He made his home at Monadnock, N. H.

THAYER, BENJAMIN BOWDITCH (1862-). An American mining engineer, born in San Francisco. After graduating from the Lawrence Scientific School (Harvard) in 1885, he engaged in mining operations in Montana, California, New Mexico, and Mexico. Becoming connected with the Anaconda Copper Mining Company, he served after 1908 as its president until 1915, when the Anaconda absorbed the Amalgamated Copper Company. Thenceforth he was vice president of the greater company. In 1914 he served as president of the American Institute of Mining Engineers and in 1915 was appointed to the United States Naval Consulting Board.

THAYER, ELI (1819-99). An American educator, inventor, and antislavery agitator, born at Mendon, Mass. He graduated at Brown University in 1845, and in 1848 founded Oread Institute, a school for young women at Worcester, Mass. In 1853-54 he was a member of the Lower House of the Massachusetts Legislature. He is chiefly remembered for his connection with the Kansas Crusade, the purpose of which was to secure the admission of Kansas as a free State. With this aim in view he early in 1854 organized the Massachusetts Emigrant Aid Company; soon afterward affiliated it with the Emigrant Aid Company of New York; and a year

later reorganized the two under the name of the New England Emigrant Aid Company. Local leagues were established whose members emigrated to Kansas and settled in localities (Lawrence, Topeka, Manhattan, Osawatomie) where the company had erected hotels for temporary accommodation and had provided sawmills and other improvements. The company proved a financial failure, but its main purpose was successful. (See KANSAS, *History*.) In 1850 Thayer began a somewhat similar but unsuccessful work in Virginia, and founded the town of Ceredo, containing about 500 inhabitants from New England. From 1857 till 1861 he was a member of the National House of Representatives. He was also an inventor, and he patented, among other things, a hydraulic elevator, a sectional safety steam boiler, and an automatic boiler cleaner. He published a volume of Congressional speeches (1860), a collection of lectures (1886), and *History of the Kansas Crusade* (1889).

THAYER, EZRA RIPLEY (1866-1915). An American lawyer and educator, son of James Bradley Thayer (q.v.). He was born at Milton, Mass., and was educated at Harvard (A.B., 1888; LL.B., 1891). Admitted to the bar at Boston in 1891, he was a member of the law firm of Brandeis, Dunbar, and Nutter from 1896 to 1900, and of Storey, Thorndike, Palmer, and Thayer from 1900 to 1910. Thenceforth until his death he was Dane professor of law at Harvard and dean of the Law School. Through influence in this latter office he did much to raise the standards and improve the curriculum of legal education in the United States. In a fit of insanity he committed suicide by drowning.

THAYER, JAMES BRADLEY (1831-1902). An American lawyer and author, born at Haverhill, Mass. He graduated at Harvard in 1852 and at the Harvard Law School in 1856. From that time until 1874 he engaged in the practice of law, and from the latter year until his death he was a professor in the Harvard Law School. He was the father of Ezra Ripley Thayer (q.v.). His publications include: *Letters of Chauncey Wright* (1877); *A Western Journey with Mr. Emerson* (1884); *The Origin and Scope of the American Doctrine of Constitutional Law* (1893); *The Teaching of English Law in Universities* (1892); *Cases on Evidence* (1892); *Cases on Constitutional Law* (1895); *The Development of Trial by Jury* (1896); *A Preliminary Treatise on Evidence at the Common Law* (1898); and *John Marshall* (1901). Consult the *Harvard Graduates' Magazine*, vol. x (1901-02), and the *Harvard Law Review* (April, 1902).

THAYER, JOHN ADAMS (1861-). An American publisher, born in Boston. He was educated in the public schools of Cambridge, Mass., and became a printer and typefounder. He served as advertising manager of the *Ladies' Home Journal* in 1892-98, as business manager of *Munsey's Magazine* in 1898, and as advertising director of the *Delineator* from 1898 to 1903. In the latter year he joined in organizing the Ridgeway-Thayer Company, publishers of *Everybody's Magazine*, but retired from this enterprise in 1906. Thayer lived in Paris from 1906 to 1911, when he became publisher and owner of the *Smart Set Magazine*. He wrote *Astir, a Publisher's Life Story* (1910; rev. ed., 1912).

THAYER, JOHN MILTON (1820-1906). An

American soldier and politician. He was born at Bellingham, Mass., was educated at Brown University, and was admitted to the Massachusetts bar. In 1853 he went West and in the following year settled at Omaha, Neb., which he made his permanent home. In 1855 he was elected major general of the Territorial forces, and until 1861 conducted the campaigns against the Indians, in 1859 capturing the Pawnees and placing them on a reservation. At the outbreak of the Civil War he became colonel of volunteers and served with distinction till 1865. For his bravery at Fort Donelson and Shiloh he was promoted brigadier general, and assisted Sherman in the siege of Vicksburg. In 1867-71 he was United States Senator from Nebraska, and in 1875-79 Governor of Wyoming Territory. From 1887 to 1893 he was Governor of Nebraska.

THAYER, JOSEPH HENRY (1828-1901). An American biblical scholar, born in Boston. He graduated at Harvard in 1850, and at Andover Theological Seminary in 1857. In 1864 he became associate professor of sacred literature in Andover Theological Seminary, and in 1884 professor of New Testament criticism in Harvard Divinity School. He translated the New Testament grammars of Winer (1869) and of Buttmann (1873), and published *A Greek-English Lexicon of the New Testament* (1886). He was a member of the American New Testament Company of Revisers of the Authorized Version.

THAYER, SYLVANUS (1785-1872). An American soldier, known as the father of the United States Military Academy. He was born at Braintree, Mass., graduated at Dartmouth in 1807 and at West Point in 1808, and entered the corps of engineers. During the War of 1812 he served under General Dearborn as the chief engineer of the Northern army (1812); under General Hampton as aid-de-camp and chief engineer of the right division of the Northern army (1813); and under General Porter at Norfolk, Va., as chief engineer and brigade major (1814-15). The two following years he spent in Europe studying fortifications and military schools, and observing the operations of the allies. From 1819 to 1833 he was superintendent of the Military Academy at West Point, and thoroughly reorganized the institution, improving it greatly. During the following years he was employed in constructing fortifications and harbor improvements around Boston and as a member of various boards until 1858, when he was granted sick leave. In March, 1863, he was commissioned colonel of engineers and shortly afterward was brevetted brigadier general in the regular army. On June 1, 1863, he was retired from active service. He gave liberally to education, founded a free library and endowed an academy at Braintree, and founded (1867) the Thayer Engineering School at Dartmouth College.

THAYER, WILLIAM ROSCOE (1859-1923). An American author and editor. He graduated from Harvard in 1881, and became editor of the *Harvard Graduates' Magazine* in 1892. In 1914 he was elected to the American Academy of Arts and Letters, and he received honorary degrees from Harvard, Yale, Brown, and other universities. His verse includes *The Confessions of Hermes* (1884); *Hesper, an American Drama* (1888); *Poems, New and Old* (1894). In prose he published, notably: *The Dawn of Italian Independence* (1893); *History and Customs of Harvard University* (1898); *Throne-Makers*

(1899); *A Short History of Venice* (1905); *Life and Times of Cavour* (2 vols., 1911); *Life and Letters of John Hay* (1915); *Germany vs. Civilization* (1916).

THAYER, WILLIAM SYDNEY (1864-). An American physician. He was born at Milton, Mass., and was educated at Harvard (A.B., 1885; M.D., 1889). After some years on the faculty of Johns Hopkins University, he became professor of clinical medicine there in 1901. He made important investigations in malarial fevers and typhoid, and was the first to report clinically the third sound of the heart. His many essays deal with his investigations.

THEÆTETUS (Lat., from Gk. *Θαῖτηρος*, *Theaitētos*). An important dialogue of Plato, discussing all the answers to the question: What is knowledge? The speakers are Socrates and the Athenian youth Theætetus.

THEAGENES, *thē-āj'ē-nēs*. The hero of a Greek romance by Heliodorus (q.v.). See also **CHARICLEA**; **HELIODORUS**.

THEATINES. A Roman Catholic religious community, which played, next to the Jesuits, the most important part in the movement for reform from within the Church in the sixteenth century. Its founders were St. Cajetan (Gaetano da Tieni) and Giovanni Pietro Caraffa, at that time Bishop of Chieti, from the Latin title of whose see, Theate, the order took its name. With two other friends, they obtained a brief of Clement VII, dated June 24, 1524, formally constituting the new brotherhood, with the three usual vows, and with the privilege of electing their superior, who was to hold office for three years. They were all to be priests. Their first convent was opened in Rome, and Caraffa was chosen as superior. He was succeeded in 1527 by Cajetan, and the congregation began to extend to the provinces. After a time, however, it was thought advisable to unite it with the somewhat analogous Order of the Somaschians (q.v.); but Caraffa, who was elected Pope, under the name of Paul IV, restored the original constitution in 1555. The Theatines extended themselves over Italy, and into Spain, Poland, and Germany, especially Bavaria. The first French house was founded in Paris under Cardinal Mazarin in 1644. To their activity and zeal Ranke ascribes much of the success of the Counter-Reformation in the south of Europe. At the present time the order numbers not more than 100 members. In 1909 Pius X united the order with the Spanish congregation of the holy family at Barcelona.

There is an order of nuns bearing this name. It was founded in Naples, in 1583, by Ursula Benincasa. It never spread out of Italy and has now only a few nunneries.

THEATRE (OF. *theatre*, Fr. *théâtre*, from Lat. *theatrum*, from Gk. *θεάτρον*, *theatron*, place to view shows or plays, from *θεάσθαι*, *theasthai*, to view, behold, from *θέα*, *thea*, view, sight). A building used for the presentation of dramatic and similar spectacles.

Ancient. The theatre as a form of architecture was originated by the Greeks and naturally developed with the drama. At first it was simply the open space near the Temple of Dionysus, where the chorus danced about the altar of the god while the solitary actor, perhaps standing on the steps of the altar, carried on a dialogue with their leader. It is probable that at times the chorus of satyrs (see **SATYR**) actually drew a wagon containing the actor who

impersonated the god, and who naturally addressed his companions from this vantage ground, and it is quite possible to see in such a scene the car of Thespis, with which the founder of tragedy is said to have traversed Attica. When tragedy became a state institution at Athens, set places for its performance were naturally provided; one of these was the Orchestra near the Agora, a circular dancing place which was surrounded by raised seats for the spectators. The other theatre was in the precinct of Dionysus Eleuthereus at the eastern end of the southern slope of the Acropolis, afterward occupied by the stone theatre.

The earliest Athenian theatre was simply a large circular place (*ὀρχήστρα*, *orchēstra*, from *ὀρχεῖσθαι*, *orchēsthai*, to dance) about 75 feet in diameter, near the temple. On the hill rose the seats for the spectators (*θέατρον*, *theatron*, in the strict sense), and these were further enlarged by artificial mounds of earth, so as to form rather more than a semicircle. The orchestra was entered by two passages (*πάροδοι*, *parodoi*) from the sides; these lay between the ends of the seats for the spectators and the skene (see below). The nature of the ground was such that at the rear it was raised some distance above the level of the sacred precinct, thus affording an opportunity for an underground passage, Charon's steps, by which actors could rise from the ground in the centre of the orchestra. There was at first no scenery or background, and some neighboring house was used as dressing room. In the centre of the orchestra might be an altar or tomb or other structure, probably of no great height. Such simple settings are all that seem required for the earlier plays of Æschylus, such as the *Suppliants*, *Seven Against Thebes*, and *Persians*. Soon, however, an innovation was made. A tent (*σκηνή*, *skēnē*) was introduced to serve as a dressing room, and this speedily became a building, apparently erected just outside the circle of the orchestra, and provided with three doors. It might represent a palace or temple or any other building called for by the play; or the front might be covered with a painted scene, as in the *Birds* of Aristophanes. During all this time actors and chorus were on the same level in the orchestra, except that gods and occasionally other characters seem to have appeared on the roof of the skene. Our knowledge of this theatre of the fifth century is partly based on the very scanty ruins of the earliest structure, and partly on the internal evidence of the plays themselves, in which there are many passages which imply that actors and chorus are on the same level, and none, with the exception above noted, that clearly imply any raised stage for the actors. In the fourth century, probably, the theatre at Athens was rebuilt in stone, the orchestra being moved farther back into the hill, and reduced to about 60 feet in diameter, stone seats were provided for the spectators, and outside the circle of the orchestra was erected a long stone skene, with projecting wings (*παρὰσκήνια*, *paraskēnia*). Later, in the Greek theatre, the orchestra became less than a circle, but regularly more than a semicircle. It seems probable that between these wings the scenery was now displayed, but there is no evidence, in the remains, of any raised stage. The old view, still held in modified form by many, is that in the fifth and fourth centuries there was a stage

for the actors, probably low, in front of the skene, and that when the chorus was discontinued this was replaced by the high platform of the Hellenistic theatre. Somewhat later there was erected, a short distance in front of the skene, a low wall (*προσκήνιον*, *proskēnion*) about 12 feet high, composed of columns, or half columns, supporting an entablature, and with the intercolumniations filled with wooden panels. There was a door in the centre, with possibly two more, one near each side. In front of this structure the paraskenia projected but a little. The space between the skene and proskēnion was roofed over, forming a platform, which varies in different theatres, but is from 10 to 12 feet in height and from about 7 to 9 feet in width. It is maintained by some that in the plays of the Hellenistic time the actors appeared on this level, as there was no chorus. On this point the evidence is far from clear, but it seems not improbable that actors in the drama proper occupied the lower level, and that this platform was for gods. In Asia Minor, under the influence of modified conditions, another type was developed by diminishing the height and increasing the width of the stage, reducing the orchestra to less than a semicircle. This operation might be described as sinking a part of the orchestra, for the lowest row of seats is frequently (as at Aspendus) on a level with the stage, and not, as in earlier Greek theatres, at the level of the orchestra. It is to be noted that this is not really a lowering and extension of the proskēnion, for at the rear of the new stage appears a decorated front of columns or half columns and cornices, which forms a background to the actor, similar to that formed by the old proskēnion. There was no curtain in the Greek theatre. The seats for spectators in the Greek theatre were usually laid in whole or in great part against a hillside; the Roman theatre, on the other hand, was regularly built on level ground so that huge substructures of concrete and masonry were necessary to carry the seats.

In the Roman theatre the plan is very similar in outline, but the details differ widely. The orchestra was only a semicircle, and was used commonly for seats of honor. The other half of the circle was covered by a low stage (*pulpitum*), whose depth was somewhat less than a radius of the orchestra, and its width not over two diameters of the orchestra. In the rear wall were three or five doors, and in the side walls two. Entrance into the orchestra was provided by the building of arched passages under the seats at the sides of the stage; these arched passages took the place of the parodoi of the Greek theatre. In the Roman theatre there was a curtain which worked on a roller that revolved in a wide, deep slot at the front of the stage. The curtain was lowered at the beginning of a play, raised at the close.

In Greece, outside of Athens, the chief theatres are at Epidaurus, Eretria, Sicily, Megalopolis, Mantinea, Delphi, Oropus, and Delos. In Asia Minor Greek theatres have been studied at Pergamum, Magnesia on the Mæander, Priene, and Miletus. In Sicily and Lower Italy the Greek theatres have been altered in Roman times. Fine ruins remain at Taormina, Syracuse, Segesta, Pompeii, and Fiesole (near Florence). At Tingda, too, in Africa there are remains of a fine Roman theatre; so too in Aspendus in Asia Minor, and at Orange (an-

cient Arausio) in France. The last-named theatre, which is well preserved, and has been partly restored, is particularly large and imposing.

In Athens plays were performed only in connection with the festivals of Dionysus (see GREEK FESTIVALS), i.e., the Country Dionysia, the Lenæa, and the Greater or City Dionysia. It was at the latter that tragedy developed, and here the great tragedies were first produced. Comedy was at first confined to the Lenæa, but after about 465 B.C. was also part of the Greater Dionysia. At the Greater Dionysia three tragic poets competed, each producing a tetralogy, i.e., three tragedies and a satyr play. One tetralogy seems to have been performed on each of the three days. The three comedians produced only one comedy each, which seems to have followed on each day the group of tragedies. The arrangements were in charge of the Archon Eponymus, who chose the three poets from among those submitting works, and assigned to each a *choregus*, i.e., a wealthy citizen upon whom devolved the expense of the production. The production was a competition between the choruses, and the victorious *choregus* dedicated a tablet to Dionysus. The poets received a crown of ivy and a sum of money. At first it seems to have been usual for the poet to play the leading rôle. The view long held that only three actors in all were allowed in a Greek play has been challenged. After the fifth century B.C. and perhaps earlier the leading actors also competed for a prize. The profession was not dishonorable, and the actors seem to have been always free citizens, as were the chorus. Women did not appear on the stage, unless possibly as flute girls. The costume of the tragic actor was a long tunic, with close-fitting sleeves often richly embroidered, and a cloak or mantle, with sometimes a shorter tunic under the cloak. Masks were also worn, and the stature was somewhat increased by padding, a high top to the mask, and thick-soled shoes (*cothurni*), which also served to raise the actor somewhat above the level of the chorus (the use of the *cothurni* in the best period of the drama has been disputed by K. K. Smith). The dress of the tragic chorus seems to have resembled that of daily life, except of course in such cases as the Eumenides of Æschylus, where the Furies produced a great impression by their awe-inspiring appearance. The satyr chorus wore masks reproducing the typical satyr countenance, a goatskin around the loins, and *phallot*. The comic actors wore tights, apparently often of gay colors, a short tunic and cloak, a phallus, and comic mask; the costume of the chorus varied with its character, and the poets allowed free scope to the imagination, as in the *Birds* and *Clouds* of Aristophanes. In the new comedy the dress was modified and more nearly approached that of daily life, from which the characters were taken. At the same time there was introduced a typical series of masks, so designed that the mask at once indicated the character, a device quite useful, in the absence of programmes.

At Rome the drama, like the theatre, was largely borrowed from the Greek, but it was not a state performance by citizens, at least in its developed form. The government was long hostile to the theatre, so that it was necessary to make the plays as completely Greek as possible in appearance. The actors were troupes

(*greges*) of freedmen or slaves, and the plays were in general adapted from the Greek, especially in tragedy, though the *fabulæ prætextæ*, tragedies based on Roman themes, in which the hero wore the *toga prætexta* and not the Greek costume, were an attempt to treat national subjects in the Greek tragic style. In the comedy were distinguished the *fabulæ palliata*, based on the Greek new comedy in which the Greek cloak (*pallium*) was worn, and the *fabulæ togata*, treating of native life and character, and appropriately costumed. The plays were produced at public games (*ludi*), and also at the games or shows given on special occasions by private individuals. The magistrate or giver of the games paid the leader of a troupe (*dominus gregis*), who owned plays and produced them. The theatre thus never entered into or reproduced the national life in Rome as in Greece, and in later times the favorite Roman shows were the *Mimes* and the *Atellane*, both of which seem to have been marked by buffoonery and indecency. See MIMIC; ATTELLANE.

Mediæval and Modern. During the Middle Ages theatrical performances began with dialogue additions acted out in the church service for Christmas and Easter. They developed in the twelfth century into plays in the vernacular presenting the chief events in sacred story from the creation to the last judgment. In the fifteenth century even miracles connected with the lives of the saints were told in drama. Such development made necessary performances on scaffolds by the church walls and by the fifteenth century the assignment of various plays to the amateur actors of the town or the guilds. The shipwrights, e.g., produced the play of *Noah*. Allegorical dramas depicting the contention between the personified good and evil powers of the soul for the possession of man developed fully in the fifteenth century and gave larger opportunity for acting because of realistic comic elements. In Spain the religious plays were at first produced in open town squares on a platform carried by 12 men, but later on cars or floats provided with curious mechanical contrivances. In France the prevailing type of stage was a long platform erected for the occasion, on which were represented, one beside the other, the places of action, as the garden of Gethsemane, the pretorium of Pilate, the hill of Calvary, and the mouth of Hell. The actors moved from one place to another before the eyes of the spectators. In England the commonest way was to have the separate plays in a series produced on a succession of pageants, or stages on wheels, so that the populace at any one station might witness without stirring all scenes in the processional drama. While the great towns were thus elaborately producing these religious plays there grew up for smaller places and private houses bands of strolling players. They formed a guild of their own in England as early as 1469. In Spain one of the founders of the national drama is Lope de Rueda, whom we first hear of as the head of a company of players in Benavente in 1554. His stage, according to Cervantes, "consisted of four benches arranged in a square, with four or five boards upon them, raised about four spans from the ground."

In Madrid places for the representation of all secular plays were merely the yards of houses.

The stage was at the rear. The audience stood in the courtyard, while the windows about served as boxes for the more distinguished spectators. There was no roof or other protection from sun or rain. When a theatre was built in 1574 it differed from this original in few respects. When charitable societies erected their own permanent playhouses, in the Street of the Cross in 1579 and in the Street of the Prince in 1582, they soon became the only public homes of Madrid for the greatest masterpieces in the history of Spanish drama. In them the court was paved and protected by an awning, and contained near the stage a number of portable benches. Rows of seats rose in an amphitheatre about the court beneath the boxes and galleries, and at the rear was a gallery exclusively for women. In England also these players of interludes performed in innyards, but they likewise acted in town halls and the banqueting halls of nobles. Under Elizabeth these companies increased in importance until it became a great distinction for a nobleman to have players under his protection. The most famous company is the one originally formed by the Earl of Leicester with James Burbage as leader, because Shakespeare eventually joined it, wrote all of his plays for it, and produced all of them with it. Probably the inn suggested to James Burbage some features of the first public theatre, which he erected just outside of London in 1576. It was an amphitheatre, and, somewhat like the Spanish interior, had three galleries running around it and standing room for the vulgar in the pit or central space. But his stage was a platform projecting far into the pit so that the audience was on three sides of the actor, whereas the Spanish stage seems to have been within a frame, like our modern stage without the front curtain. The most famous of London theatres, the Globe, was erected in 1598 south of the Thames. In it Shakespeare produced all his most famous plays. There was no curtain except at the rear to cut off a recess or alcove under the balcony, and another across the balcony itself, which was used to represent a tower, the walls of a city, or such a balcony as Juliet's. The curtains might be drawn aside to discover new persons or properties. More than one place was frequently indicated on the stage at once by hanging up placards over the doors or elsewhere. Properties, such as chairs, trees, rocks, booths, were much used, and the costumes were rich. Performances were given by daylight in the afternoon, a flag above the theatre announcing a play, and a bugler by a blast giving notice of the beginning of the performance. The Spanish theatre at this time also used no scenery, or almost none, except curtains of a single color at the back and the sides of the stage. In the Blackfriars, north of the Thames, which was roofed over and frequented by persons of quality, seats were provided and plays presented by candlelight.

In France the playhouses were modeled on those of Italy, where architects adapted the plans of ancient theatres to new uses. In Rome one was built of wood as early as 1514. In 1580 Palladio began to erect at Vicenza probably the first theatre of stone in Europe. It is still extant. The stage was divided by three arches, in each of which a street built in in perspective could be seen leading off to one side or the other. The Hôtel de Bourgogne, erected

in 1548 by the Brothers of the Passion, who had held the privilege of acting plays since 1402, was the first public theatre in Paris. Its stage, like those for the passion play, represented several places at once. But the theatre opened by Richelieu in 1641 in his palace had a stage inclosed as by a picture frame as in a modern playhouse. The only scenery for the first production represented a colonnade and a terrace with a view of the sea. Such was the stage on which Molière produced nearly every one of his plays. The performance usually began at five o'clock. The floor, to-day called the orchestra, was then the pit, where for a few cents the common spectators stood during the performance. The gentry sat in the galleries or on wooden benches on low steps at the rear of the auditorium. His productions were very simple. For *The Misanthrope*, his masterpiece, the scene was a room in which only six chairs were needed. For a century the scenery was no more pretentious, because the smartly dressed dandies were allowed to sit on the stage and to shout to each other or to address the actors as insolently as they pleased. In fact, sometimes only one actor at a time could make his way to the front through the crowd, and in 1739 a performance of Racine's great tragedy, *Athalie*, could not be completed for this reason. In 1759 the Count of Lauraguais got rid of these spectators on the stage by giving the Comédie-Française 12,000 livres to make good the loss. During the seventeenth and eighteenth centuries most of the improvements in staging came in connection with the opera, which received in Italy a gorgeous development. Scenery was built to slide into place on grooves from the sides, so that the stage was given the appearance of great depth. Room was also provided for large troupes and for machinery needed in transformations and other scenic wonders. Lighting was arranged above, at the sides, and as footlights, below. In eighteenth-century France even Watteau did not think it beneath him to paint scenery for the Opéra and the Opéra Comique, and a similar development took place in Spain, England, and Germany. The costumes in the French theatre were lavish but utterly conventional, all heroes, e.g., appearing in Louis XIV wigs, three-cornered hats, and gilt armor.

The great transformation in the English theatre began with the Restoration in 1660. The actors now included both men and women, as had been true for several decades in French, Spanish, and Italian companies. The building was from now on a hall roofed over. The pit was filled with benches for those of modest means, while the occupants of the galleries were sharply divided socially. The hour of performance was at first three o'clock, but by the end of the century it was five, and in time was advanced to six because of the later hour for dining. Sitting on the stage, which, introduced into France, was to linger for a century yet, was permitted only on nights when the play was given as a benefit. The curtain was a long way back from the front of the stage, and as the actors played well forward and as boxes extended back to the curtain, the audience was still on three sides of the player. The space before the curtain, however, was gradually shortened into an apron stage until in the nineteenth century, hardly projecting beyond the

proscenium arch, it became the now universal picture-frame stage. Scenery had first been used in 1656, and was developed during the Restoration period, particularly in opera. In the theatre the shifts were mostly flats running in grooves. The lighting was from branches or hoops of candles suspended from the ceiling. In 1765, at the height of Garrick's fame, Drury Lane had only six chandeliers, each holding 12 candles, which had to be let down at the end of every act to be snuffed. Though footlights had been common in opera for many years, Garrick after his return from France in 1765 introduced lamp footlights and seems to have made much more extensive use of such lighting in plays than had been customary. Even under these circumstances the stage would have seemed to us a dim and confusing place. The costuming was little more appropriate than in France at this period. Garrick played Macbeth in a scarlet and gold military suit of his own day, and he dressed Hotspur in a laced frock and Ramillies wig. One of his actors, Henderson, boasted of having played 10 characters in one season in the same costume. Naturally, therefore, new plays were usually produced with the stock scenery.

Theatrical history in America appears to have begun with the production of Addison's *Cato* in Philadelphia in August, 1740. The stage was set up in a warehouse on King or Water, between Pine and Lombard streets. The alleged evil influences of theatrical activity drove the Murray and Kean company to New York, where they presented *Richard III* on March 5, 1750. The advertisement shows how similar conditions were to those in England, declaring that the performance was "to begin precisely at half an hour after 6 o'clock, and no person to be admitted behind the scenes." Of the playhouse all we know is that it was a room in Nassau Street "lately belonging to the Hon. Rip Van Dam, deceased." The season continued to July 8, 1751, when the company disbanded. But it was reorganized the next year to appear in Annapolis in another reformed warehouse. A longer history is that of the American Company, organized in England and directed by Lewis Hallam, which first appeared in the colonies at Williamsburg, Va., Sept. 5, 1752, in *The Merchant of Venice*, in a building on the outskirts of the town which was turned into a theatre for the occasion. Lewis Hallam's company next appeared in New York, where he built "a fine, large theatre in the place where the old one stood." He played only on Mondays, Wednesdays, and Fridays from Sept. 17, 1753, to March 18, 1754. In April he began a two-months' season in Philadelphia in the warehouse that had been occupied by Murray and Keane. Thence he went to the West Indies. After his death Mrs. Hallam married in Jamaica David Douglass, who reorganized the company. In New York in 1758, as the Nassau house had given place to a church, he built a new theatre on Cruger's wharf, near what is now called Old Slip, not far from the Wall Street Ferry. He opened with *Jane Shore*, Dec. 28, 1758, and closed on February 7 following. His "Histronic Academy," as he called it, must have been a very rude structure, for it was demolished soon after he left. Undaunted by the hostility in New York he built another temple of the drama in Philadelphia, on the southwest corner of Vernon and South streets, on Society Hill, opposite

the famous Blue Anchor Inn, where Penn landed when he came from Chester in 1682. His brilliant season lasted for only six months on account of a law prohibiting plays. It was not till 1766 that the first permanent playhouse in America was built—the old Southwark Theatre in South Street, Philadelphia. The first-story walls were of brick, the rest of wood—all painted a glaring red. The stage was lighted by oil lamps without chimneys. The company was now known as the American Company, and presented *The Prince of Parthia* on April 24, 1767, the first American play ever presented on the stage. The first permanent theatre in New York was opened by Douglass in John Street on Dec. 7, 1767. It too was principally of wood and painted red. It had two rows of boxes, a pit, and a gallery. The dressing room and the green room were in an adjacent shed. In 1771 he erected by subscription a brick theatre in Annapolis with a seating capacity of about 600. In 1773 by the same means he erected a playhouse in Charleston, where the Southern aristocracy supported a brilliant season. After the Revolution the first handsome and complete theatre in the United States was the Chestnut Street Theatre in Philadelphia. It was modeled after the playhouse in Bath, England, and was opened on Feb. 17, 1794, by a newly organized company, chiefly from England. Scarcely inferior was the Federal Street Theatre in Boston, opened by an English company earlier in the same month. The prosperity of these years was followed at the close of the century by a period of depression.

Since the last decade of the nineteenth century the theatre has developed so enormously on all sides that it cannot easily be described in terms of anything previously existing. This change has been due, first, to the literary genius which was thrown into dramatic writing in the second half of the nineteenth century, an amount of genius greater than the theatre has had at any time since the age of Elizabeth; and second, to the rapid progress of the physical sciences, especially in electricity. These two influences have raised the theatre from the position of a third-rate institution, scarcely related to literature or the arts, to one of unsurpassed power as a cultural force and an artistic instrument. Dramatic literature, which had for two centuries been held in rigid conventional grooves, has been freed to take all knowledge as its province. All types of social questions can now be discussed in dramatic form; nearly all genres of literary production have their dramatic parallels; and all types of pictorial and plastic art can be reproduced in the scenic setting. The theatre is now the only one of the arts which makes use of all the others. In the last quarter of the nineteenth century it was absorbing artistic and literary forces from the outside; in the first quarter of the twentieth it was established as a creative force and was reflecting back new influences to the other arts.

Types of Organization. Theatres exist in many various relations to their audiences and to the money which supports them. In Germany the important theatres are operated by the state or municipality, through appointees who may or may not receive a salary. In France the state-owned theatre is generally sublet to a private entrepreneur on terms which are supposed to protect the public. In both countries public subsidization prevails. In England, where the

theatres are entirely commercial, there is a sharp distinction between London and the provinces, the latter being served by traveling companies which rarely touch the capital. A few cities like Manchester have local repertory theatres, private in their business organization but semipublic in the spirit of their management. In the larger cities of Russia state endowment prevails, and for the poorer classes, both in urban and rural districts, the government has developed an elaborate system of cheap theatres, formerly supported out of the income from the liquor tax. In America we find an astonishing lack of system and stability in the business of play producing. Usually the plays are first produced in New York or some other large city by a private individual with a cast of actors hired specially for them, and then, if successful, sent on the road to play for the smaller cities as long as success continues. The method of financing these enterprises varies greatly. Sometimes the large producing firms supply the capital and the theatres; often private individuals furnish the money as a speculation, and the theatre may be rented or secured on a basis of the division of gross profits. On the road the last-named method prevails, but the theatres, though usually privately owned, are under the control of the national booking agencies, which arrange a play's tour to suit their interest.

Commercial Theatre. The commercial theatre, operated frankly for private profit, is a comparatively recent development. The view that theatrical production is primarily a business has flourished chiefly in England and America, where individual initiative has traditionally been exalted over state action. Under this system each play produced is a distinct speculative venture. An individual or corporation supplies all necessary capital, making contracts with actors and other artists contingent upon the success of the play, and in general distributing the risks as widely as possible. The failure of a play under this system becomes a loss not only for the producing individual or corporation, but also for the theatre, the actors, and the supplementary staff. This high risk tends to the inflation of prices on all sides. With the prices of seats prevailing in England and America (25 cents to \$2 or \$2.50) a play brings in at the maximum from 100 per cent to 300 per cent net profit per week. Because of the high risk on the one hand and the high potential profit on the other, the commercial manager tends to confine himself to those plays which have the widest possible appeal. And since these conditions have inflated abnormally the prevailing cost of theatrical production, it follows that the play of limited appeal is placed under a heavy economic disadvantage. Hence commercial production has generally been prejudicial to the special and experimental forms of dramatic art. It is to offset this condition that (in America and England) numerous semicommercial theatres have arisen, quite distinct from the commercial theatre in organization and personnel, and variously known by the names little theatre, art theatre, community theatre, and the like.

State Theatre. The state theatre (either national or municipal), which prevails throughout France and Germany, is operated on a different basis. Its success is measured not in net financial profit, but in the quality and quantity of the art product produced for a given sum of

money. It is assumed that the theatre exists for the benefit of the public (as it was in earlier days for the benefit of the King patron). The state theatre always draws a subsidy from the public treasury. But this subsidy is never a blanket underwriting of future losses; it is a fixed amount advanced to cover estimated losses over a given period. For all further losses the manager is held responsible (though not always in a financial sense). In Germany the manager or intendant is usually a man of social distinction serving without pay. In provincial France he is a business man or entrepreneur, agreeing under bond to produce a certain quantity and quality of plays at a fixed tariff of prices, making good any losses out of his own pocket and receiving as his own any profits that may accrue. In either case the theatre has a stable and business-like organization. The state subsidy can hardly be said to be applied to losses; rather it is applied to reducing the price of seats, in recognition of the public utility of the institution. The theatre, with its business and artistic staff, is a business unit. Contracts are made by the year and financial speculation is reduced to the minimum. The yearly budget is a relatively constant factor, since nearly all the expenses can be foreseen. This, however, would be impossible if the yearly income were not equally constant. The cause for this stability of demand, which continues in nice equilibrium with the supply, is to be found, first, in the fact that the state theatre has usually had a monopoly over many decades and has thus been able to measure itself to the supply; and second, in the stable cultural background of the French and German peoples, which tends to create definite and homogeneous standards in the audiences.

Prices in the state theatres of France and Germany usually range between 25 cents and \$1, with an abundance of special seats at from 6 to 15 cents. It is chiefly towards these latter seats that the subsidy is directed. The amounts of the subsidy vary widely. One of the largest is that given the Burgtheater in Vienna, which is more than \$125,000 a year. The Royal Theatre of Berlin and the Théâtre Français in Paris receive about \$50,000. In other large German cities the municipal theatre receives from \$25,000 to \$40,000 a season. In provincial France the subsidy varies from \$20,000 to \$50,000. In many cases this subsidy covers both opera and spoken drama, which are often combined in the same theatre. The larger opera houses, of course, receive much larger subsidies. The French government spends about \$350,000 a year on opera and drama in Paris alone.

Endowed Theatre. Endowed theatres are essentially private in nature, and relatively few in number. They usually exist for some particular purpose, such as the exploiting of a certain type of play. The endowment may be in the nature of a blanket underwriting of losses, or it may yield merely a definite sum per year, but in either case it is devoted to a theatre which cannot be expected to pay for itself. This is not true of the state subsidized theatre. Except for a brief period of time, endowed theatres usually show little vitality. For the best artistic product the theatre should be organized on a thoroughly business-like basis. Endowments are often received by state theatres in Europe, but usually for the increasing or bettering of the artistic product in some specific way.

Subscription Theatre. The subscription theatre may be regarded as a distinct type, although it is apparently but a variation of the commercial theatre. It aims to receive, by means of season subscriptions, a definite sum of money in advance. This gives stability to its financial organization, and practically takes it out of the class of the commercial theatre of England and America. The state theatre (as well as opera the world over) rests largely on the subscription system.

Folk Theatre. A distinct type of economic organization has arisen in recent years in the theatre owned by large societies, whose membership becomes the chief constituent of the audience. This we may call the folk theatre in imitation of the German term, *Volkstheater*. It is ideally exemplified by the *Neue Freie Volksbühne* of Berlin, which normally has over 50,000 members and owns the best theatre in the city. Membership in the society gives admission to all plays produced during the season in the society's theatre, in addition to many additional privileges at special rates. The members, through their representatives, exert a considerable, though not a preponderant, influence on the conduct of the organization. Profits are devoted to a sinking fund for future needs or to some specific enlargement of the theatre's activities. The total cost of plays to members is about 30 cents each, for the best seats, and to buyers of single tickets a little more. By this scheme of organization the theatre attains the maximum of stability, and hence the highest degree of economy in theatre production which the world has yet seen. Several other large folk theatres exist in Germany and Austria. In France this type of theatre, under the name of *théâtre du peuple*, has been only moderately successful.

Artistic Organization. The organization of the artistic staff of a theatre (actors, directors, scene designers, costume makers, etc.) is distinct from that of its business management. Any type of the former may exist under any type of the latter. In America the commercial system recruits a new artistic staff for each production. In the foreign state theatres and American art theatres, the company is usually kept a unit for the whole season. In Germany the commercial theatres usually have a permanent company with frequent changes among the leading actors, while in Paris and London they are more fluid and approach the American commercial system more closely. In general, the more economical theatres operate with a permanent company, making their important changes in personnel only at the end of the season.

Repertory Theatre. The term "repertory theatre" is somewhat loosely used to include several types, all of which, however, have a permanent company. Usually the term refers to a producing theatre modeled after the state institutions of the Continent, which present a dozen or more new plays each season, together with many older pieces, alternating them from night to night in accordance with the public demand. The company is from two to three times as large as would be needed for an average play, and thus two plays can be in rehearsal, so to speak, while one is being performed. To a certain extent the members of the company can be specialized, some being saved for romantic parts, some for comic parts, etc. But in general a variety of ability is demanded of each member

of the troupe, and the repertory company thus serves as an admirable training school for the young actor. The plays of any given week are usually highly varied in character, no piece (except a new one) running for more than two successive nights. The special economic advantage of this method is that the cost of each production is figured in with the expenses of the whole season, and a loss in the case of any unsuccessful play can be distributed over the various successful plays of the season. Further, this repertory system is the only one yet devised by which a play with a limited appeal can be made to pay for itself. This greatly increases the variety of product and hence the efficiency of the theatre.

Stock Company. The stock company, which for many decades was the chief purveyor of drama to the smaller American cities, is organized in a manner similar to the repertory theatre. The distinction between the two is largely theoretical. In common usage the repertory theatre is supposed to be first class in price and to produce its new plays in the first or second season of their theatrical life. The American stock company, on the other hand, has assumed the position of a cheap by-product of the commercial system, with a scale of prices as low as 10 to 35 cents and as high as 25 cents to \$1. It may or may not be a touring company. When it is not on tour it produces plays singly for one or more weeks, and usually only those plays which are no longer running in the first-class theatre. Usually the artistic product of such stock companies is poor. A few approximate a fair standard of excellence, but these usually succumb to competition when their prices are raised.

Long-Run System. The popular term "long-run system" has become the technical name for the prevailing system of production in the first-class commercial theatre of America. It is duplicated in other countries, but nowhere has it gained such complete control over the national system of play production as in the United States. It is based upon the premise that each play is a unit of speculation and must be made to yield the highest possible gross return. A play may run as much as two full seasons in New York City alone, and at the same time be put on the road with as many as five additional companies. The gross returns from one such play must be figured in the millions of dollars. An actor is sometimes obliged to act a single part without respite for three or four years. The net profits to the entrepreneur may be many times the capital invested. Because of this tremendous margin of potential profit the commercial managers have been led to speculate freely and to expend great sums of money in the erection of theatres. The result has been a material overproduction of the theatrical commodity to fill these theatres, and a consequent increase in the risk and decrease in the average quality of theatrical production. The remuneration to stars (actors and actresses of great popularity) has been correspondingly inflated. Much money and effort have also been expended to bring the theatres of the road under the centralized control of New York. The results have been generally regarded as detrimental to dramatic art in America. The growth of the motion-picture business has modified this system, but has not in any essential respect changed it.

Under this system the actors are hired on

an agreed weekly wage, but the contract is revocable on the part of the manager at any time, upon notice of a week or less. Sometimes the actor must contract to remain as long as the play continues to be acted, without receiving any reciprocal contract from the manager. (Probably such a contract is not valid in law, but it can usually be enforced by the custom of the theatrical business.) In nearly every case the actor gives his services gratis for the period of rehearsal, which usually lasts three to four weeks, but may be extended by the manager. Stars are sometimes retained under long-time contracts irrespective of the success or failure of the plays in which they appear. The weekly remuneration of actors of some experience and professional standing is from \$100 to \$500 a week. But stars may receive far more.

Prices for Theatre Seats. In England in Shakespeare's time prices varied from a penny to a shilling. In the early American theatres the prices were high—from three shillings for gallery seats to six shillings for seats in the boxes. Prices fell after the Revolution to 25 cents for gallery seats and \$1 for box seats. This remained about the scale of prices until after the Civil War, when there was a steady increase. In 1870 first-class theatres in New York charged \$1.50 for orchestra seats and from 35 to 50 cents for the top gallery. About 1886 a few New York theatres began charging \$2 for the best seats in the orchestra and the first row in the first balcony, and gradually all first-class theatres made \$2 the price of orchestra seats, with \$1.50 and \$1 for the balconies, and 50 cents for the gallery. For operatic performances \$2 and \$2.50 were the prices for orchestra seats in the New York Academy of Music until 1878, when the price was advanced by the English manager, Mapleson, to \$3. A few years later, with the advent of Madame Patti, the price rose to \$5 for orchestra seats, at which it has since remained. In Germany, with the exception of Berlin, the price of the best seats for either opera or drama seldom exceeds \$1.50, and usually, for plays, is well beneath \$1.

Law of Theatres. For legal purposes, a theatre is a house or building adapted and used for the purpose of dramatic performances. The courts differ in the various States as to what may be considered a dramatic performance, but generally almost any exhibition on the stage is included in this term. Thus, negro-minstrel shows and comic operas have been held to be theatrical performances within a law governing theatres. Laws regulating theatres are a constitutional exercise of the police power. Because of the public character of theatres, statutes have been enacted in most States prohibiting the discrimination against persons or citizens wishing to attend theatrical performances on the ground of race, creed, or color. This legislation is applicable also to hotels, barber shops, and all places of public amusement. Any discrimination for reasons other than race, creed, or color, however, does not come within the statutory prohibition, although the courts will scrutinize carefully the nominal reason given for withholding accommodation to see whether it be in fact a mere sham. The penalties for violation of this portion of the Civil Rights Act vary in the different States; generally the penalty is a fine recoverable by the person discriminated against and sometimes also punishment by imprisonment. In the absence of stat-

ute or in instances where the statutory prohibition is inapplicable a theatre ticket is regarded as a revocable license and theatrical managers may refuse to sell a ticket, or refuse to admit a person with a ticket without assigning any reason. Where proper notice is given to purchasers of tickets, the management may make it a condition that tickets shall not be transferable. This may be done by printing such conditions on the back of the tickets themselves and by notices posted at the theatre, or by giving actual notice to purchasers. Under such circumstances theatrical managers may refuse to honor tickets bought from speculators. (See **TICKET**.) The spectators may applaud or hiss the players in moderation, but must do so to express their spontaneous emotions, and not come with the intention of stopping or interfering with the performance, as in the latter case they may be ordered to leave the theatre and be forcibly removed if they refuse. In the Metcalfe and Woolcott cases in New York, the courts have sustained the owner's right to exclude critics who are supposed to be unfriendly, on the ground that they come not as spectators but in order to conduct business on the theatre premises.

The rapid increase of moving-picture theatres has caused practically every State to adopt stringent fire regulations and also regulations as to the admission of minors. Such regulations are a legal exercise of the police power and are usually enforced by a revocation of license. While the municipality has the licensing and regulating power, it has been held that only the State has power to make disobedience to such rules a crime, as in the case of violation of the Sabbath. In most States there is no legal and compulsory form of censorship, but in Ohio, Kansas, and a few other States statutes have been passed making censorship by a duly appointed board of censors necessary before the production of the film. This legislation has recently been upheld in the Supreme Court of the United States.

Construction. The larger theatres in Europe and a few of those in the United States, e.g., the Century in New York, are isolated buildings of monumental design, usually in Europe erected by the city or state. In interior arrangement and design, European theatres, though sumptuously decorated, are often inferior in comfort and convenience to the more recent American theatres, in which special attention is given to the seating, the heating, ventilation, and exits and to fireproof construction and safety from accident. Most American theatres are, however, built on inside lots or at the corners of street blocks, hemmed in by other buildings and with little external beauty of architecture. The largest theatre in Europe is the La Scala at Milan, seating about 3500; the largest in America is the Hippodrome in New York, seating over 5000, and designed for spectacular entertainments rather than for legitimate drama. The acoustics of theatres constitute a difficult and complex problem of great importance. See **ACOUSTICS**; **OPERA HOUSE**.

The modern theatre is divided into two or three parts, kept distinct in the structural scheme. First, there is the stage, with all necessary dressing rooms and mechanical equipment for the production of the play, together with space at each side and above for the storing of scenery, etc. Next there is the auditorium with its corridors, lounging rooms, etc. Finally, there is the outer lobby with its approaches.

This is often made a part of the auditorium structure. There are several modern types of theatre differing from the traditional type based on the Italian opera house, which has its balconies in horseshoe shape and its seats generally in curved rows. Modern practice in theatre building tends to make both the balconies and the rows on the ground floor straight. The larger opera houses, which seat upward of 3000, may have as many as five distinct balconies, including those composed of boxes. But the normal theatre for the spoken drama usually has a capacity between 1100 and 1500. A distinct type of playhouse, however, which has recently come into vogue, is the little theatre, which may have a capacity as small as 99, and rarely goes above 400. This is a direct result of the intimate and lifelike character of many modern plays which demand the most accurate attention. Recently, too, the large outdoor theatre, modeled on the Greek, has come into fashion.

Auditorium.—In the auditorium, the modern theatre has been strongly influenced by German methods. In addition to making straight rows, modern theatre architects incline to a steeply pitched floor, sometimes so much as to give the spectators of each row a clear view over the heads of those sitting in front. This type of auditorium is known as the amphitheatre, without implying a semicircular plan. Modern custom also tends to the elimination of boxes and loges, or to placing them at the rear. The galleries must of course be more steeply pitched than the ground floor. In the matter of decoration, too, modern taste follows the German. The ornate quality which is to be found in the Italian opera house is giving place to straight and bare walls, with a simple and harmonious color scheme. The science of acoustics has also made strides in recent years, although it is still in its beginnings. Experience has proved that the best acoustical results are obtained when draperies and all textile accoutrements are reduced to a minimum.

Stage.—The stage is primarily nothing but a box with a curtained opening, placed at one end of the auditorium. But the recent advance in the art of theatrical production, stimulated by scientific discovery, has made it the most elaborate part of the theatre. Normally the stage opening, or proscenium, is from 28 to 35 feet wide and from 15 to 22 feet high. The depth is usually from 20 to 35 feet, although it is frequently, in small theatres, as slight as 10 feet.

The dimensions of the whole stage structure are highly various. In the older theatre it was necessary that the total height be twice as great as that of the proscenium, in order to permit the raising of all scenery without rolling it. But with the increasing use of the set scene this condition is no longer indispensable. However, the modern trend is to increase the dimensions of the stage section greatly in all directions. The total width should be at least twice that of the proscenium, the depth should be at least 35 feet, the height should be generous and is frequently three times what is absolutely necessary. Whereas the stage section used to be a mere appendage of the auditorium, it is now the largest and most complicated part of the theatre.

The equipment of the stage may be simple or complex. In addition to the apparatus for raising and lowering the curtain, there is usually an elaborate equipment of ropes and pulleys in the

flies above for raising and lowering the scenery. This apparatus is called the gridiron. The old equipment of grooves or slots in the wings or side spaces for the placing of masks or side pieces of scenery has become needless with the perfecting of the set scene. The stage itself is no longer steeply pitched, as formerly. Usually in the back there is a curved or semicircular cyclorama, painted white or sky-blue, for use in outdoor scenes. This is ordinarily made of canvas which can be rolled up on a cylinder. But it is sometimes constructed of solid plaster, and may be domed out towards the front. In one or two European theatres this dome cyclorama can be raised by machinery so as to be taken out of the actors' way. In some European theatres the stage is constructed in three lateral sections, which can be raised or lowered independently. There is often a set of trap doors in the stage with apparatus for lifting persons from below. In general, however, the permanent equipment of the stage has become much more simple than formerly. On the other hand the mechanism which may be used for special purposes is much more varied and complex.

The demand for elaborate scenery and for rapidity of scene shifting has created a number of special types of stage designed to conquer one or another of the difficulties which hamper the producer. Of these one of the best is the revolving stage used at the Deutsches Theater in Berlin. This is a circular platform which revolves upon a shaft deeply set in concrete. It is about 45 feet in diameter and is capable of receiving five or more complete sets, any one of which can be brought before the proscenium (and hence into view of the audience) by the revolution of the stage. The scene is not, however, limited to the dimensions of the revolving platform, but may be supplemented upon a surrounding stationary stage. Another type is the sliding stage, which is in reality a stage of double width which may be moved laterally so that half of it is completely concealed in the wings on either side; while the play is proceeding on one half of this platform, the setting for the following scene is being set up on the other. In some theatres the scenery is set upon small wagons, which can be rolled on to the stage in a few seconds and placed in their proper positions. In general, all scenes are set, and the painted drop or hanging canvas has little place in the modern theatre. Scene building has become a highly specialized business, and demands great ingenuity and expertness. Often realism demands the use of wooden structure of the most solid sort. On the other hand, the scene designers of recent times have taken great freedom in the art of suggesting (rather than depicting) reality by simple and conventionalized means.

Lighting.—The stage is usually lighted by incandescent bulbs placed just within the proscenium arch in the front, those below being called footlights and those above, border lights. These are in white and two or three colors, so wired that any set may be turned on and off independently of the others. Their intensity may be raised or lowered gradually at will by means of dimmers. To supplement them is a set of arc lamps called spot lights, which are movable and are usually operated from the wings, so as to cast a strong light on a certain spot or to eliminate shadows cast by the front lights. A more powerful spot light, often a calcium lamp, may be placed

in the gallery to throw a special illumination upon one or more of the characters as they move about the stage. But lighting methods, in recent years, have undergone much change and experimentation, especially in Germany. The "Fortuny system" and related methods throw upon the stage an indirect light reflected from bands of silk or plaster surfaces. Subtle gradations of color can be obtained by the mixing of the primary hues under this method. In some theatres it is the practice to illuminate the stage by means of arc lamps placed in the first balcony, thus eliminating the unreal lighting from beneath that exists under the footlight system. At the present time producers are experimenting with many different systems and types of lamp.

Production. The process of theatrical production consists of assembling and rehearsing the actors, of providing suitable scenery, and of harmonizing all the separate elements into an artistic whole. In the best theatres all this work is directed by one man through his subordinates. Modern practice has divided stage production into several distinct types. The realistic type seeks to make all details accord as accurately as possible with the reality of everyday life. What is loosely called the artistic type seeks to provide, by more or less conventional means, effects of decorative beauty for the eye and ear, without strict regard to reality. Of this latter type there are many varieties. Some designers seek flat and picturesque effects according to the laws of the easel painter. Some seek depth and atmospheric quality by means of perspective and lighting. Others seek an arrangement, either with color or design or both, that shall subtly symbolize the mood of the scene. Often plays are produced in a highly simplified fashion imitated from the Elizabethan, in which crude scenery merely suggests the locale and no pains are taken with realistic appropriateness. All these methods make use of deliberate and conventional simplification for the sake of a definite artistic effect. The style of the acting must also accord with the style of the scenery, and vice versa; in the realistic manner the actors must play with full regard for the probabilities of the situation; in the artistic they must keep in mind the decorative effect of speech, gesture, intonation, etc.

In solving all these problems producers have been obliged to call to an unprecedented extent upon the workers in the various special arts, and carefully to mold their contributions to the desired theatric effect. As a result, the theatre has become a rich and flexible artistic instrument, surpassing all others in variety and potential power.

Bibliography. Ancient theatre: the best general account in English, except on the stage question, is A. E. Haigh, *The Attic Theatre* (3d ed., revised by A. W. Pickard, Oxford, 1907); a good brief statement is L. D. Barnett, *The Greek Drama* (London, 1900). Good, with respect to the production of plays, though in need of revision, is G. Oehmichen, *Das Bühnenwesen der Griechen und Römer* (Munich, 1890); also the article "Theatrum," in William Smith, *A Dictionary of Greek and Roman Antiquities*, vol. ii (3d ed., London, 1891). A fine description of the two Roman theatres in Pompeii is given in August Mau, *Pompeii: Its Life and Art* (Eng. trans. by F. W. Kelsey, 2d ed., New York, 1902). The standard

work on the construction of the theatre is Dörpfeld and Reisch, *Das griechische Theater* (Athens, 1896); also A. Müller, "Die griechischen Bühnenaltertümer," in Hermann, *Handbuch der griechischen Antiquitäten* (Freiburg, 1886); Bethe, *Prolegomena zur Geschichte der Theaters im Altertum* (Leipzig, 1896); Puchstein, *Die griechische Bühne* (Berlin, 1901); E. R. Fiechter, *Die Baugeschichtliche Entwicklung des antiken Theaters* (Munich, 1904); K. K. Smith, "The Use of the High-Soled Shoe or Buskin in Greek Tragedy of the Fifth and Fourth Centuries B.C.," in *Harvard Studies*, vol. xvi (Boston, 1905); K. Rees, *The Rule of Three Actors in the Classical Greek Drama* (Chicago, 1908); "Theater," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914). For the theatre of Dionysus: M. L. D'Ooge, *The Acropolis of Athens* (New York, 1908), and C. H. Weller, *Athens and its Monuments* (ib., 1913). For the theatre at Epidaurus, see K. Baedeker, *Greece* (4th Eng. ed., Leipzig, 1909). See also J. G. Frazer, *Pausanias*, vols. ii and v (2d ed., London, 1913); E. Capps, "The Greek State According to the Extant Dramas," in *Transactions of American Philological Association*, vol. xxii (Boston, 1891); A. W. Pickard, "The Relative Positions of the Actors and Chorus in the Greek Theatre of the Fifth Century B.C.," in *American Journal of Philology*, vol. xiv (Baltimore, 1893). For the Roman theatre, see the "Einleitung" to the edition of Terence's *Phormio*, edited by Ziatsko and Hanler (4th ed., Leipzig, 1914), as revised by Charles Knapp, in "Notes on Plautus and Terence," in *American Journal of Philology*, vol. xxxv (Baltimore, 1914), and especially, Charles Knapp, "The Roman Theatre," in *Art and Archaeology*, vol. i (Baltimore, 1915). Medieval and modern: Edmund Malone, *History of the Stage* (London, 1821), an exhaustive account of the English stage to the beginning of the nineteenth century; William Dunlap, *History of the American Theatre and Anecdotes of the Principal Actors* (New York, 1832), the best account of the early American theatres; Garnier, *Le nouvel opéra de Paris* (Paris, 1876), an elaborate treatise on opera houses; Arthur Pougin, *Dictionnaire historique et pittoresque du théâtre* (ib., 1885), a full history of French theatres; T. F. Ordish, *Early London Theatres*, in "The Antiquary's Library" (London, 1899); Karl Mantzius, *A History of Theatrical Art in Ancient and Modern Times* (5 vols., Philadelphia, 1903-09), the most scholarly and comprehensive history of the stage in both its physical and cultural development; L. H. Lecomte, *Histoire des théâtres de Paris* (10 vols., Paris, 1905-10); M. J. Moses, *The American Dramatist* (Boston, 1911), contains some account of the early American theatre; H. K. Moderswell, *The Theatre of Today* (New York, 1914), with special chapters on stage mechanism, stage scenery, and theatre economics in the twentieth century. For the theatre in its legal aspects, consult: S. H. Waddell, *Law of the Theatre: A Treatise upon the Legal Relations of Actors, Managers, and Audiences* (Albany, 1892), and S. P. Elias, *Law of Theatre Tickets* (San Francisco, 1905). Organization and economics: P. P. Howe, *The Repertory Theatre* (New York, 1910), a record of English experience with the repertory method; P. W. MacKaye, *The Civic Theatre* (ib., 1912), contains suggestive and far-reaching statements of the possibilities of the folk theatre; Rolland,

Le théâtre du peuple (Paris, 1913), an extensive and detailed account of the folk theatre in France and Belgium; also series of articles on European state and municipal theatres in *The Drama: A Quarterly Review* (Chicago, 1913-14), and L. E. Shipman, *The True Adventures of a Play* (New York, 1914). Theatre architecture: Suchs and Woodrow, *Modern Opera Houses and Theatres* (3 vols., London, 1896-98); W. H. Birkmire, *The Planning and Construction of American Theatres* (New York, 1896); Martin Hammitzsch, *Der moderne Theaterbau* (2 vols., Berlin, 1906), an exhaustive history of theatre construction since the Middle Ages; W. P. Gerhardt, *Theatres: Their Safety, Comfort, and Healthfulness* (New York, 1915). Stage machinery: Theodor Weil, *Die elektrischen Bühnen- und Effekt-Beleuchtung* (Vienna, 1904); Vaubelle and Hemardinquer, *La science au théâtre* (Paris, 1908); Jacques Rouché, *L'Art théâtral moderne* (ib., 1910); also publications by the *Allgemeine Elektrizitäts Gesellschaft* (Berlin, 1904, 1913), on the Fortuny method of stage lighting. Stage scenery: Adolphe Appia, *Die Musik und die Inszenierung* (Munich, 1899); Georg Fuchs, *Die Revolution des Theaters* (ib., 1909); Gordon Craig, *On the Art of the Theatre* (London, 1910); Carter, *The New Spirit in Drama and Art* (ib., 1912); Gordon Craig, *Toward a New Theatre* (ib., 1913); Sheldon Cheney, *The New Movement in the Theatre* (New York, 1914); also Rouché and Moderwell, mentioned above.

THÉÂTRE ANTOINE. See **THÉÂTRE LIBRE**.

THÉÂTRE DES ITALIENS, tá'á'tr' dâ zê'tá'lyân' (Fr., theatre of the Italians). A former theatre of Paris from which the Boulevard des Italiens derives its name.

THÉÂTRE FRANÇAIS, frân'sâ'. The French national theatre. See **COMÉDIE FRANÇAISE**.

THÉÂTRE LIBRE, lê'br' (Fr., free theatre). The name of a dramatic enterprise founded in 1887 by André Antoine, then a young Parisian clerk. With some fellow amateurs of the Gaulois Club he arranged the production (March 30, 1887) of four new one-act plays at the Elysée des Beaux-Arts at Montmartre, and in the course of the year formed the association of the Théâtre Libre, to be conducted upon the following principles: the season to consist of eight different representations, one each month from October to June; no tickets to be sold to the public; the enterprise to be supported by subscribers who with invited guests should form the only audience. The design was to give young authors a chance to try their strength; and also, for art's sake, to produce plays which for any reason, political or moral, might be forbidden by the censorship if undertaken at a public theatre. In an artistic way the Théâtre Libre won success, though it excited much debate from the first. Its founder aimed to do away with all conventionality and to attain a degree of realism often thought out of the question upon the stage. In its first eight years about 150 writers contributed works for its performances, and a considerable proportion of these previously unknown pieces were afterward accepted and brought out by other theatres. At the same time such famous writers as Zola, the Goncourts, Mendès, Bergerat, Ibsen, and Tolstoy also found presentation here. Financially, however, M. Antoine found his difficulties accumulating, and in 1894

he accepted a position as an actor at the Gymnase Theatre. For a short time he was co-director of the Odéon (1896); then he resumed the direction of the Théâtre Libre, for several years located in the Salle des Menus-Plaisirs and known since 1897 as the Théâtre Antoine. To this the general public is admitted in the usual way, though subscribers still retain their special privilege at eight representations a year. The idea of the Théâtre Libre has been copied in other countries. In 1906 M. Antoine returned to the Odéon.

THEATRUM EUROPÆUM (Lat., survey of Europe). A chronicle of events which appeared in 21 volumes at Frankfort-on-the-Main between 1616 and 1718. The work was in part the forerunner of political journals.

THEBAINE. See **ALKALOIDS**.

THEBAÏS, thê'bâ-is or thê-bâ'is (Lat., from Gk. Θηβαίς). 1. The territory of Thebes, in Egypt. In later times the name was applied by the ancients to Upper Egypt. 2. An ancient Greek epic giving in 7000 verses the story of the house of Labdacus and the attack of the seven chieftains on Thebes. 3. A dull and long-drawn work by P. Papinius Statius, dedicated to Domitian. It contains in 12 books the story of the contests of Eteocles and Polynices.

THEBAN CYCLE. The name given to a series of ancient Greek epics treating the legends of Thebes. It includes the *Thebais* (q.v.); the *Epigoni*, a poem of about 7000 lines, telling of the capture of the city by the descendants of the heroes of the *Thebais*; and the *Œdipodeia*, attributed to Cinathon, a Lacedæmonian, containing about 6000 lines and giving the story of Œdipus.

THEBAN LEGION. See **LEGION**, **THEBAN**.

THEBES, thêbz (Lat. *Theba*, from Gk. Θῆβαι). A celebrated city of ancient Egypt, situated on both sides of the Nile in about lat. 25° 50' N. (Map: Egypt, C 2). Its old Egyptian name was *W̄set*, but in later times it was also called *Nu(t) Amen*, "the city of Ammon," *Nu(t)* 'o, "the great city," or simply *Nu(t)*, "the city" (*urbs*); in the Old Testament it is called *No* or *No Amon*, and in the Assyrian inscriptions its name appears as *Nî*. By the Greeks, who identified the god Ammon with Zeus, it was sometimes called Diospolis, "the city of Zeus," and it was specially designated as 'Great Diospolis' to distinguish it from 'Lesser Diospolis,' the modern Hon. The origin of the more usual Greek name Θῆβαι is obscure. Thebes was the capital of the fourth nome of Upper Egypt, and was a very ancient city, but did not rise to importance until the time of the eleventh dynasty, which was of Theban origin. Under this and the following dynasty the city was the capital of Egypt, and some of its oldest temple buildings date from this period.

Its real greatness, however, begins with the expulsion of the Hyksos invaders by the Theban princes, who united the whole land under their sway (eighteenth dynasty), and adorned their city with temples and palaces of unprecedented magnificence. The kings of the nineteenth and twentieth dynasties added to the work of their predecessors, and for centuries Thebes was the chief residence of the Egyptian Pharaohs and far surpassed all other cities of the land in wealth and splendor. The persecution of the worship of Ammon by the heretic King Amenophis IV (q.v.) and the temporary removal of

the seat of government to Tel el Amarna affected Thebes but little. Seti I and especially Rameses II (c.1340-1273 B.C.) restored the desecrated sanctuaries and lavished enormous wealth upon the Theban temples. Under the twenty-first dynasty, however, Thebes ceased to be the capital of Egypt, and from this time gradually declined in importance. In the seventh century B.C. it was again the seat of government, for a time, under the twenty-fifth or Ethiopian dynasty, but when the capital was removed to Sais (q.v.) by the following dynasty (twenty-sixth), it began a new period of decline. Its temples were repaired and new buildings were erected by later monarchs, especially by the Ptolemies, but, overshadowed by the rise of new cities, it gradually sank to the position of an insignificant provincial town. Its great temples sustained serious injuries in the course of various revolts against the Ptolemies, and were further ruined by an earthquake in 27 B.C. In the time of the geographer Strabo (24 B.C.) Thebes was a ruined city, as at present, its site being occupied merely by a few scattered villages.

The city proper lay upon the east bank of the river between the great temples now represented by the ruins of Luxor (q.v.) and Karnak (q.v.); a little to the north was the suburb Ma'du, the modern Medamut, with a temple built by Amenophis II (eighteenth dynasty) and dedicated to the Theban war god Mont (q.v.). Additions were made to this temple by Seti I, Rameses II, and several of the Ptolemies, but it is now almost entirely destroyed. On the west side of the river were suburbs of considerable size, and Rameses III seems to have built his palace in the neighborhood of his memorial temple at Medinet Habu (q.v.), but in general this side of the river was occupied by the Theban necropolis, which extended to the Libyan range. It contained numerous temples, erected as memorials of the Egyptian kings and to these temples were attached dwellings for the priests, schools, granaries, stables, barracks, and other buildings. Nearer the hills were the dwellings of the artisans who were employed in the necropolis, stone-masons, builders, painters, sculptors, and especially embalmers. There were also inns for the entertainment of visitors, and many shops for the sale of funeral offerings and other objects. The necropolis, in fact, formed a great city. The principal memorial temples of the Theban necropolis, beginning at the north, were those of Kurnah (q.v.) and Deir el-Bahri (q.v.), the Ramesseum (q.v.), and that of Medinet Habu (q.v.). The rocky hills bordering on the plain of the necropolis are honeycombed with tombs. In a narrow valley to the north of Kurnah are the tombs of the kings, in which were buried the monarchs of dynasties XVIII-XX. Each of these tombs contains a number of galleries and chambers whose walls are covered with paintings and religious texts. Here, next to the tomb of Rameses IX, Theodore H. Davis discovered in January, 1907, the tomb of Teia, the mother of the heretic King Amenophis IV. The hatred which this king had aroused by his attempts to reform the state religion is shown by the fact that the tomb of his mother was opened after his death to erase every trace of his abominated name. The queen's mummy even had been turned over to erase the name of Akhen-Aten incised on a sheet of gold beneath it. The tomb presented the same lavish display of gold which was found in the tomb of the queen's

parents, Tua and Yua, also found by Mr. Davis. Instead of the usual sarcophagus the coffin was sheltered by a great catafalque (torn to pieces by the invaders of the tomb) plated heavily inside and out with gold. The coffin, too, was completely covered with a frame of gold inlaid with lapis lazuli, carnelian, and green glass. The mummy, as well, was entirely wrapped in a sheath of gold. The canopic jars offer considerable interest in the four portrait heads of the queen which replace those of the usual gods' heads. Near Kom el-Hetan, between Medinet Habu and the Ramesseum is the famous "vocal Memnon" (see MEMNON). It was in no way distinguished from other colossi. The chief deities worshiped at Thebes were the great god Ammon (q.v.), his spouse Mut (q.v.), and their child Chons (q.v.).

THEBES (Gk. Θῆβαι, *Thebái*). The principal city of Bœotia, in ancient Greece, situated in the southeastern part of the country, on the northern slope of a ridge which separates the valley of the Asopus from the plain to the north (Map: Greece, Ancient, C 2). The Acropolis or Cadmea, now occupied by the little town of Thiva or Phiiva, lay on the high ground between the Ismenus and Dirce. At its greatest extent the ancient city seems to have extended beyond both streams. According to legend, Cadmus (q.v.) was the founder of the city—hence the Acropolis was known as the Cadmea. The city played a prominent part in the stories of the heroic age, the series of epics (see THEBAN CYCLE) vying in interest with those which gathered about Troy. For these stories, see CEDIPUS; ANTIGONE; ETEOCLES AND POLYNICES; CREON; AMPHILON; DIRCE. After the Bœotian invasion Thebes seems gradually to have secured the leading place in the Bœotian league, reducing finally the rival city of Orchomenus (q.v.). Tradition told of the code of laws drawn up for the city in the eighth century B.C. by the Corinthian Philolaus. It is not till near the end of the sixth century B.C. that we reach a purely historical period—the earliest well-attested event being the dispute between Thebes and Plataea (q.v.), as a result of which the latter city placed itself under Athenian protection, and the former became involved in an unsuccessful war. During the Persian invasion under Xerxes Thebes sided with the invaders, and fought against the confederated Greeks at Plataea (479 B.C.). This conduct greatly weakened for a time the prestige of Thebes, and almost cost her the headship of the Bœotian league. After the battle of Coronea (447 B.C.), however, the tendency to revolt was checked, and from this time Thebes was almost continuously the recognized leader in Bœotia. In the Peloponnesian War Thebes sided with Sparta, and at its close was eager for the destruction of Athens. But the policy of victorious Sparta soon aroused distrust, and Thebes gave a friendly welcome and shelter to those Athenians whom the oppression of the Thirty

Tyrants (q.v.) compelled to abandon their city. It was from Thebes that Thrasybulus and his band started on their famous expedition for the deliverance of Athens, accompanied by a body of Theban citizens. During the following years the Thebans completely changed their policy towards Sparta, and in the Corinthian War were among the bitterest enemies of their old ally. The Peace of Antalcidas (q.v.) (387 B.C.), as interpreted by Sparta, broke up the Boeotian league, and led to new disputes, culminating in the treacherous seizure of the Cadmea by the Spartans (382 B.C.). The expulsion of this garrison by Pelopidas (q.v.) and his associates (379 B.C.) led to renewed hostilities, which culminated in the battle of Leuctra (371 B.C.), where Epaminondas (q.v.) crushed the power of Sparta outside the Peloponnesus. Before his death at Mantinea in 362 B.C., Epaminondas had secured for Thebes the supremacy in Greece, though Athens was estranged and even openly hostile. Thebes, however, did not long hold the position thus gained. The quarrel with Athens prevented any union against the growing power of Macedonia, until the seizure of Elatea (338 B.C.) furnished an opportunity for Demosthenes (q.v.) to secure by his eloquence a union for which he had long striven. The effort came too late, and in the same year the battle of Chæronea (q.v.) crushed the liberties of Greece.

After the death of Philip II, of Macedon, father of Alexander the Great, the Thebans made a fierce but unsuccessful effort to regain their freedom. Their city was taken by Alexander, who leveled it to the ground, sparing, it is said, only the house of the poet Pindar, and sold the entire surviving population into slavery (335 B.C.). For 20 years the city remained in utter desolation, but in 315 B.C. it was rebuilt by Cassander (q.v.), who gathered into it all the Thebans he could find in Greece. It now had a circuit of about five miles, and seems to have prospered. It suffered at the hands of Mummius (146 B.C.) and was severely punished by Sulla for siding with Mithridates. After this it steadily declined, and Pausanias found only the Cadmea inhabited, and the lower city in ruins. It revived under the later Roman Empire, as it was a safer residence than the exposed coast cities. During the eleventh and twelfth centuries it was the seat of a considerable population engaged in the manufacture of silk, and yielded a rich booty to Norman plunderers in 1146 A.D. Under the Turks it again declined, and even now is only a country town with a population of about 3500. The course of the town walls can be traced in some places, and deep digging has brought to light some remains, but in general there are but few vestiges of the ancient city left. Consult: M. Müller, *Geschichte Thebens* (Leipzig, 1879); E. von Stern, *Geschichte der spartanischen und thebanischen Hegemonie* (Dorpat, 1884); E. Fabricius, *Theben* (Freiburg, 1890); K. THEBES, SAINT PAUL OF. See **PAUL OF THEBES, SAINT.**

THE DALLES, dälz. A city and the county seat of Wasco Co., Oreg., 88 miles east of Portland, on the Columbia River, the Oregon-Washington Railroad and Navigation Company and the Great Southern railroads, the Dalles-Celilo Canal, and on several steamship lines (Map: Oregon, D 2). Noteworthy features are the United States Land Office, county fair grounds,

Chautauqua, Carnegie library, city hall, courthouse, Federal building, high school, and the city hospital. There are here railroad repair shops, a large flouring mill, lumber yards, salmon and fruit canneries, a wool scouring plant, planing mills, creamery, machine shops, and a box factory. Pop., 1900, 3542; 1910, 4880.

THÉDÉNAT, tã'de-nã', HENRI (1844-1916).

A French archæologist, born in Paris. He studied in the Ecole Pratique des Hautes-Etudes at the Sorbonne, devoting himself especially to epigraphy. His publications, in collaboration with Héron de Villefosse, include *Les cachets d'oculistes romains* (1882) and *Inscriptions romaines de Fréjus* (1885). He also wrote *Le Forum romain et les Forums impériaux* (4th ed., 1914) and *Une carrière universitaire, Jean-Élie Nourrisson* (1901).

THEINER, tî'nër, AUGUSTIN (1804-74). A German Roman Catholic historian and canonist. He was born at Breslau and educated there and at Halle, where he took his degree as Doctor of Law in 1829. His intercourse in Paris with Lamennais (q.v.) seems to have disturbed his religious views, but he was reconciled with the Church at Rome in 1833, and became a teacher in the College of the Propaganda. After his ordination to the priesthood, he entered the Congregation of the Oratory, and published several historical and critical works. In 1855 he was placed in charge of the Vatican archives. In 1870 he was removed from the position of archivist, apparently in consequence of the charge that he had supplied documents with which to combat the theory of the infallibility of the Pope. His most important work was the new edition of the *Annals* of Baronius and his continuators, with three supplementary volumes. Important also are the collections of documents on the ecclesiastical history of various countries and of the Council of Trent. In his *Geschichte des Pontificats Clemens XIV* (1853), he attacked the Jesuits and roused fresh suspicions of his loyalty to the Church, which were confirmed by his *Histoire des deux concordats de la république française en 1801 et 1803* (1868) and by his friendly intercourse with the German Old Catholic leaders. He died of apoplexy at Civita Vecchia. Consult Gösiger, *P. Theiner und die Jesuiten* (Mannheim, 1875), and Brück, *Geschichte der katholischen Kirche in Deutschland* (Mainz, 1896).

THEISM (from Gk. *theós, theos*, god). The theory which assumes a living relation between God and His creatures, though it does not necessarily define it. The term came to be used in England in the seventeenth century in contrast with deism (q.v.), as expressing a more vital and personal relation of God to His creation than the term "deism" then served to denote. In western thought the discussion of the relation of God to the world arose with the Greeks. In the philosophic theism of Socrates, which was a reply to the irreligion of the Sophists, we find a clear conception of a divine personality and an attempt to prove its existence. Socrates makes use of the doctrine of final causes for this purpose, maintaining, against the Sophistic

materialism, that the universe is the product of benevolent moral will (*Phædo*, 90, 199): that this will holds personal relations with all his creatures, and seeks to bring the highest good to all. Plato added little to the fundamental conception except to develop it by means of his doctrine of the Idea (*idéa, εἶδος*). The absolute Idea is the Good, i.e., God. In the *Republic* (509 b.) we accordingly read: "All intelligible beings derive their being and their essence from the good." To this thesis he adduces four proofs, all bearing on Socrates' idea of final cause. 1. From the notion of efficient cause. All things proceed from some cause, and the cause must be adequate to produce what exists. (*Sophist*, 205 b.) 2. From the ideal nature of the cause. If there be a universe of real things, as no one can doubt; it can proceed only from an ideally perfect cause, i.e., from God. (*Philebus*, 30.) 3. From the idea of cause as motion. All motion implies a self-mover, i.e., an adequate originating cause for the motion and change. (*Laws*, x.) 4. From the finality of cause. All things seek their end. The end must be moral, and therefore transcendent. In other words, the universe must at last prove itself to be a revelation of the Good, i.e., God. This is the heart of the Platonic theism. "Let me tell you, then, why the Creator made this world of generation. He was good, and the good can never have any jealousy of anything. And being free from jealousy, He desired that all things should be as like Himself as they could be." (*Tim.* 29.)

Aristotle's argument is the same as Plato's, but deeper in its empirical developments. He rises, synthetically, through nature, to his proof of the divine existence. In the eighth book of his *Physics* he gives us what he calls his proof of the First Mover. Everything that is in motion is moved either by something else or by itself. If the former be the case, we are obliged to follow up the series of causes until we arrive at the idea of a self-mover, i.e., an immovable cause having its end in itself.

Augustine, the most eminent of the early Christian thinkers, adopted the Platonic theism, seeking to combine it with the Christian views. He accepted substantially all the principal proofs of God's existence and His providential government as these had been prepared in Greek thought; but there were points where he added to previous thinking. The Greeks had put a gulf between God and the world. Augustine completed this by declaring that God made the world out of nothing, and without the aid of intermediate agents. Second, Augustine taught that God creates out of His mere goodness and bounty, not because He has need of anything; so that in creating He adds nothing to His nature. (*Conf.* xiii. iv.) This view struck at the Stoic pantheism, at the Oriental theories of emanation, and at the fundamental weakness of the Platonic theism, the failure to define the nature of the relation between God and the finite world.

The various other proofs of the existence of God given in the Middle Ages pursue two methods, one *a priori*, the other *a posteriori*. That is, one starts in Platonic fashion with the idea of a perfect being and infers its existence from this idea; the other argues, after Aristotle, from the evidences of order and perfection in the world to the idea of a perfect being who is the author of them. Anselm is an early and promi-

nent representative of both this and the *a priori* or ontological argument, which assumes that God is a being of such a nature that it is impossible to conceive any greater. The defect of this argument, as Gaunilo pointed out, consists in arguing from existence in thought to existence in fact. From the former, of course, we can logically infer nothing but an ideal thought existence.

Other theistic proofs during the Middle Ages were concerned with the course of nature and history. Thus Duns Scotus declared that the impossibility of conceiving an infinite chain of natural cases necessarily carried the mind to the idea of a great first cause adequate to the production and preservation of the world. Aquinas also (*Summa* I., qu. 2) reaches the same conclusion, a *contingentia mundi*, reproducing Aristotle's proofs almost word for word. The contemplation of final causes, though not extensively meditated upon, led to very similar logical results from the cosmological point of view; for mediæval thinkers were fond of dwelling on the fact of the imperfection of the physical and of inferring therefrom the existence of a perfect being in whose spiritual essence the soul could find the ground of the Christian faith.

In modern times philosophical meanings have largely supplanted the theological. Thus Descartes, the most important modern thinker on this subject, developed his theism only after sweeping aside all presuppositions derived from a supernatural source or from the symbols of the Church. Starting with the bare fact of thought (*cogito, ergo sum*), he argues that there must be an adequate cause for the thought of God in the mind. By this thought Descartes says that he means "a substance infinite, eternal, immutable, independent, all-knowing, all-powerful; by which I myself and every other thing have been produced." (*Méd.* iii.) Now this thought cannot be a mere negation; for it has reality. Nor can it have arisen by adding many ideas together; for it is simple. Could it have arisen as a result of my growing intelligence? No; because the idea does not admit of growth: God is infinite always and does not admit of more or less. Hence the idea must have a divine origin. A second proof may be stated thus. We need this idea in order to explain to us the immediate existence and continuance of the universe. God is not only needed as a Creator, but much more as a Preserver. The existence now of a universe involves the self-existence of its absolute cause. As a third proof Descartes revived Anselm's so-called ontological argument, i.e., the argument from the idea of a most perfect being to its existence. Reality, in his view, is as much a part of the idea of a perfect being as the angles of a triangle are of the essence of our idea of a triangle.

Kant, in the third part of his *Dialectic*, criticizes this argument of Descartes. He does not, indeed, deny the fact that we have the idea of a perfect being, but he doubts if from the idea we have any right to infer its real existence, since it is possible for us to have an idea (e.g., of a centaur) that does not correspond to any object. And inasmuch as all possible proofs of the existence of God are reducible to this one, the ontological, Kant considers that all the arguments of Descartes and of the mediæval thinkers failed to establish their point. Accordingly he proposed a new and infallible proof, the so-called practical or moral argument for the

existence of God, which is as follows. We have the notion of a moral law; conscience responds to the categorical moral imperative. Universal experience proves that happiness and virtue involve each other and cannot be separated. Now, said Kant, for this conviction there is needed a cause, supreme and infinite; a cause capable of clinching this relation between happiness and virtue to all eternity; a cause which will secure the triumph of justice as against the moral inequalities of the present life. This moral cause we call, by faith, God.

Hegel disagreed with Kant's conclusions, and sought to revive the ontological argument of Anselm and Descartes, in a new form, contending that the idea of a perfect being was an expression of the nature of all thought and all reality. For him thought and reality are the same. We can never get "beyond" thought. To put a barrier, as Kant did, between thought and thing is, for Hegel, to cease to think. Modern thought tends to emphasize the personality of God, as the ground of human personality. It also lays great emphasis on the immanence of God, both in man and in the natural world, yet not with deistic or pantheistic implications.

THEISS, tîs (Hung. *Tisza*, Lat. *Tissus*). The largest tributary of the Danube, and, next to the latter, the principal river of Hungary (Map: Hungary, G 3). It rises in the Carpathian Mountains and flows first westward, then south, the lower half of its course being parallel with that of the Danube below Budapest. After a tortuous course of 800 miles it joins the Danube about 30 miles above Belgrade. In its upper course through the narrow mountain passes it is rapid and clear, but in the great plain of central Hungary it is very sluggish; from Szegedin to the end of the Theiss—150 miles—the river has a fall of but 15 feet, so that any rising of the Danube drives back the Theiss and causes disastrous inundations. Large sums have been expended in attempts to regulate the flow of the river and drain the marshes. The Theiss is navigable to Tokay, but steamboats ascend generally only to Szegedin at the mouth of the Maros (q.v.), the chief tributary. From the lower course of the river a canal runs westward to the Danube. The Theiss is famous for its fish.

THELLUSSON (têl'ûs-son, or *Fr. pron.*, tâ'ly'sôn') **ACT**. See **PERPETUITY**.

THEME (Lat. *thema*, from Gk. θέμα, thing laid down, deposit, prize, proposition, subject, from τίθεναι, *tithenai*, to set, place). In music, a term which is in a general sense synonymous with subject or motive (q.v.). Every composition is built up from themes which constitute

the basic material. In a specific sense, the theme of a fugue is the subject (*dux*). In variations the theme is a complete musical idea, generally of periodic structure. It is always played in its entirety before the variations begin. See **LEITMOTIV**; **SONATA**; **SYMPHONY**.

THEMIS (Lat., from Gk. Θέμις, justice personified, from τίθεναι, *tithenai*, to set, place). In Greek mythology, the goddess and guardian of the eternal laws, established by the gods. In the Hesiodic theogony she is called the daughter of Uranus and Gæa (heaven and earth), the wife of Zeus, and, by him, mother of the Horæ (Hours) and Mœræ (Fates). In Æschylus she is identified with Gæa, and called mother of Prometheus. As guardian of the due order of things, she was also possessed of prophecy. The popular conceptions do not seem to have distinguished sharply between Themis and Gæa, and at Athens we hear of *Gê Themis* as a single divinity. At Rhamnus she was honored in the Temple of Nemesis, and here has been found a fine statue by Chairestratos of Rhamnus, an artist of the early third century B.C. Consult: Otto Gruppe, *Griechische Mythologie und Religionsgeschichte* (2 vols., Munich, 1906); Rudolf Hirzel, *Themis, Dike, und Verwandtes* (Leipzig, 1907); J. E. Harrison, *Themis: A Study of the Social Origins of Greek Religion* (Cambridge, 1912).

THEMISTIOS (Lat., from Gk. Θεμιστιος) (?-c.388 A.D.). A Greek rhetorician of Paphlagonia, surnamed Euphrades (eloquent), who lived at Constantinople, as a teacher of philosophy and oratory. Though a pagan in religion, he was highly honored by several of the emperors for his nobility and learning. He was tutor to Arcadius, the son of Theodosius, who made him Prefect in 384. There are extant 34 of his speeches, which, though chiefly eulogies in compliment to various emperors, contain interesting allusions to contemporary history, and instructive quotations from the ancient philosophers; and some of his paraphrases of portions of Aristotle (the *Posterior Analytics*, the *Physics*, the *De Anima*, the *De Cælo*, and Book II of the *Metaphysics*; the last two are known only through Hebrew versions). The orations have been edited by Dindorf (Leipzig, 1832); the paraphrases as a whole by Spengel (ib., 1866).

THEMISTO (Lat., from Gk. Θεμιστώ). In Greek legend, the third wife of Athamas (q.v.). Her husband, on discovering that his former wife, Ino (q.v.), was still alive, sent for her, and Themisto in revenge planned to slay Ino's children. With this intention she directed a new slave to clothe her children in white and Ino's in black, but Ino, who was herself the slave in disguise, reversed the command, and Themisto killed her own children, whom she did not distinguish in the night.

THEMISTOCLES (Lat., from Gk. Θεμιστοκλῆς, *Themistoklēs*) (c.514-449 B.C.). An Athenian general and statesman, born about 514 B.C., the son of Neocles, an Athenian citizen of middling station and circumstances, and a Carian or Thracian woman. After the battle of Marathon (490 B.C.), when the first invasion of the Persians had been successfully resisted, Themistocles, with keen foresight, recognized that the final decision of the question of supremacy would come on the sea, and that the only way for the Greeks to be victorious was to have a large fleet. He aimed, therefore, at the development of a strong Athenian navy. To this end he

persuaded the Athenians to devote the proceeds arising from the working of the silver mines at Laurion (q.v.), which it was intended to distribute among the citizens at large, to the construction of a strong fleet. He secured the passage of a law that a certain number of new triremes should be built every year. From the time of the expulsion of Aristides by ostracism (483 B.C.), Themistocles controlled the politics of Athens, and in 481 B.C. was made archon eponymus. When it was learned that Xerxes was preparing a powerful armament to invade Greece, and the Athenians had been told by the Delphian oracle to defend themselves with the "wooden wall," Themistocles interpreted this answer as referring to the ships of Athens. At the battle of Artemisium (480 B.C.) Themistocles, as commander of the Athenian fleet, which was the largest in Greece, consented to fight under the Spartan commander, Eurybiades, but it was only through the former's tact and adroit use of bribes that the Greek commanders were finally induced to make a stand in that place. This engagement was indecisive. In the same year, at Salamis (q.v.), was fought the battle which shattered the naval power of Xerxes. Here again Eurybiades was commander in chief, and here again it was owing to Themistocles alone that the Greeks were induced not to retreat to the Isthmus of Corinth, but to give battle in their present position. He threatened, if a separation were now made, that the Athenians would take their women and children and sail to Italy, there to found a new home. Finally, he precipitated the contest, by dispatching to Xerxes a secret message to the effect that, if the Persians wished to crush the Greek fleet, they should advance to the attack without delay, before the Greeks had an opportunity of fleeing. After the battle of Salamis Themistocles was the most important man in Greece. When the Persians had retreated from Greece and the Athenians undertook to restore their city, the Spartans, sending an embassy to Athens, urged the Athenians not to attempt to rebuild the fortifications. Then Themistocles, going on an embassy to Sparta, entertained the Spartans with his false professions, and kept the matter in abeyance till such time as the walls were sufficiently advanced to allow of their being defended. In 471 B.C. he was ostracized and retired to Argos; and finally, to escape being tried for treason, in which, according to some accounts, he was implicated by the correspondence of Pausanias (q.v.), he betook himself in 465 B.C. to the court of Artaxerxes, King of Persia; but, before he would see the King himself, he got permission to wait a year, during which he made himself master of the language and usages of the country. At the end of this time he managed to raise himself so high in the King's favor that, after the Persian fashion, the town of Magnesia was appointed to supply him with bread, Lampascus with wine, and Myus with other provisions. He lived securely at Magnesia until his death in 449 B.C. Some authorities assert that he poisoned himself. A monument was erected to Themistocles in the market place of Magnesia, and it is said that his bones were secretly taken to Attica, and there burned. His life was written in ancient times by Plutarch and Cornelius Nepos. Consult: Wecklein, *Ueber Themistokles* (Munich, 1892); Bauer, *Themistokles* (Merseburg, 1881); and the standard histories of Greece.

THÉNARD, tã'nâr', LOUIS JACQUES (1777-

1857). A French chemist, born at Nogent-sur-Seine. He was professor of chemistry at the Ecole Polytechnique, at the Collège de France, and at the University of Paris. From 1810 he was a member of the Institute. His original researches resulted in numerous important contributions to chemistry. He improved the methods of ultimate organic analysis; investigated the compound ethers or esters; discovered the peroxide of hydrogen, cobalt ultramarine (Thénard's blue), etc. He published *Traité élémentaire de chimie théorique et pratique* (4 vols., 1813), which passed through several editions, and, jointly with Gay-Lussac, two volumes of *Recherches physico-chimiques* (1811).

THEOBALD I. King of Navarre. See THIBAUT I.

THEOBALD, thê'ô-bald or tib'ald, LEWIS (1688-1744). A Shakespearean editor, born at Sittingbourne, in Kent. Though educated for the law, he early turned to literature. He wrote and adapted plays, and made translations from Sophocles, Aristophanes, and other Greek authors. In 1725 Pope published an edition of Shakespeare, work for which he was ill equipped. Theobald sharply reviewed it in a volume entitled *Shakespeare Restored* (1726). Pope retaliated by making Theobald the first hero of the *Dunciad* (1728). Early in 1734 Theobald brought out his own edition of Shakespeare in seven volumes. At the time of his death Theobald was at work on an edition of Beaumont and Fletcher, which appeared six years later. Theobald's original prose and verse is of little account, but as a textual critic he possessed rare insight. His one aim was to divine, in a corrupt passage, what Shakespeare wrote, and he made over 300 corrections, which have been generally adopted. Consult Collins, *Essays and Studies* (London, 1895). See POPE, ALEXANDER; DUNCIAD.

THEOBROMA. See CACAO.

THEOBROMINE (from Neo-Lat. *Theobroma*, from Gk. *θεός*, *theos*, god + *βρῶμα*, *brōma*, food), C₇H₅N₃O₂. An alkaloid chemically allied to uric acid and still more closely related to caffeine (theine). It is found in considerable quantities in cocoa and may be extracted from powdered cocoa beans with hot water; the resulting solution is freed from tannin and other impurities by precipitation with lead acetate; next, the solution is freed from lead by means of sulphureted hydrogen, and evaporated to dryness; the theobromine is, finally, extracted from the dry residue by boiling with alcohol. The theobromine may be obtained artificially from the lead salts of xanthine by the action of methyl-iodide. Theobromine is a white crystalline substance sparingly soluble in water and forming crystalline compounds with both acids and bases. Among its compounds may be mentioned theobromine-sodio-salicylate, a substance obtained by mixing sodium salicylate with sodium-theobromine, and used in medicine under the name of diuretin. Diuretin acts as a diuretic without having any action upon the heart. See ALKALOIDS.

THEOCRITUS (Lat., from Gk. *Θεόκριτος*, *Theokritos*) (c.310-c.245 B.C.). The first and greatest of the Greek bucolic poets. The details of his life are not clearly known. He was commonly reckoned a Syracusan, although some have believed that Cos was his birthplace. In any case, he spent considerable time in that island and eastern Greece, where he was ac-

quainted with the elegiac poet Philetas and the writer of epigrams Asclepiades, whom tradition makes his teachers, and also with the physician Nicias of Miletus and the poet Aratus (q.v.) of Soli. He spent some time at the court of Ptolemy Philadelphus in Alexandria and also at the court of Hiero II at Syracuse; but the exact dates for these periods cannot be determined, as the chronological order of his poems is uncertain. We have current under his name 31 poems and a number of epigrams. Of the longer poems 10 are bucolic, three are mimes in imitation of the mimes of Sophron and very similar to the recently discovered mimes of Herondas, and the other poems are of varying subjects and character, while a few are spurious. Theocritus displayed marvelous power in uniting artistic and popular elements in his verse in a way which has never been equaled by his followers and imitators. His language is, for the most part, a modified Doric; two poems are in the literary Æolic. Though he lived in an artificial period, there is in his work a simplicity, a fidelity, and a love of nature that has given him universal fame. His dramatic and mimetic power was great, so that his peasants, shepherds, reapers, and fishermen have a real existence and are not merely literary creations. He was imitated by Bion and Moschus among the Greeks, and by Vergil most successfully among the Romans (in the *Eclogues*). Important editions are by Ahrens (2 vols., Leipzig, 1855), and especially by Ziegler (Tübingen, 1879). The most recent edition of the text is by U. von Wilamowitz-Moellendorf (Oxford, 1907). The best edition with commentary is by Fritzsche-Hiller (Leipzig, 1881). There are English editions by Kynaston (Oxford, 1892) and by Cholmeley (London, 1901); English translations in verse by Calverley (2d ed., Cambridge, 1869); by Andrew Lang (New York, 1880); A. S. Way (Cambridge, 1913); and in prose, by Metcalfe (Boston, 1906). There is a special lexicon to Theocritus by Rumpel (1879). Consult also: Legrand, *Étude sur Théocrite* (Paris, 1898); W. C. Wright, *A Short History of Greek Literature* (New York, 1907); Christ-Schmid, *Geschichte der griechischen Literatur*, vol. ii, part i (5th ed., Munich, 1911).

THEODICY, thê-ôd'î-sî (from Gk. *theos*, *theos*, god + *dike*, *dike*, justice). The exposition of the theory of divine providence, and particularly the defense of the goodness and wisdom of God against objections drawn from the existence of pain and sin in the world. The problem is as old as human thinking; the name is modern and dates from the close of the seventeenth century. The first to consider the question in its entire scope was Leibnitz (q.v.) in his *Essais de théodicée* (1710). In England a long list of publications has appeared, principally in reply to the sensational school beginning with Hume and closing with J. S. Mill, who could scarcely maintain the existence of God, and saved His benevolence only at the expense of His omnipotence. In America, where Jonathan Edwards made contributions to the discussion in his famous *Freedom of the Will* (1754), and was followed by Bellamy, *Wisdom of God in the Permission of Sin* (1758); Hopkins, *Sin through the Divine Interposition an Advantage to the Universe* (1759); and many others, down to N. W. Taylor (q.v.), whose contribution to the subject may be condensed in the hypothesis that in the best moral system a benevolent God might

not be able to prevent sin consistently with the maintenance of the system and the attainment of the highest results therefrom. He thus gave a place to the human will which no theologian of orthodox descent had previously given. Since the appearance of Hegel, the Christian idea of God has met with new objections, and theodicy has been enlarged to consider these, especially by Maret and Gratry in France. The appearance of pessimism in Germany gave a new turn to the argument, since it was no longer possible to assume as undisputed the principle of Leibnitz, that God has chosen the best possible world. And with the appearance of evolution and the Spencerian agnosticism, the argument has turned to the more fundamental matters; so that theodicy has almost disappeared as a distinct department of theology.

THEODOLITE (of uncertain etymology; perhaps from Gk. *theasthai*, *theasthai*, to see + *doûs*, *kodos*, way + *litos*, *litos*, smooth, even; hardly from Gk. *theasthai*, *theasthai*, to see + *dolichos*, *dolichos*, long). An instrument used in surveying especially in geodetic work for the measurement of horizontal and vertical angles. It is larger than the transit and, having larger and more carefully graduated circles, is employed in measuring angles where the highest accuracy is demanded. In its main features it is similar to this instrument, but differs chiefly in that its telescope does not revolve completely or transit in its horizontal axis. See GEODESY; SURVEYING INSTRUMENTS.

THEODORA (c.508-548). A Byzantine Empress, wife of Justinian. She was the daughter of Acacius, the keeper of the wild beasts at the circus of Constantinople, and after his death was for a time a favorite on the stage and a famous courtesan. She fascinated Justinian, nephew of the Emperor Justin I, by her great beauty, and about 525 he married her. Thereafter she led an exemplary domestic life. In 527 Justinian became Emperor, and Theodora henceforth exerted a commanding influence upon public affairs. She was extremely cruel, and her numerous spies ferreted out all who were opposed to their royal mistress. At the time of the Nika Riot (532) she prevented Justinian from fleeing and brought about the suppression of the insurrection. Most of our information concerning Theodora is derived from Procopius' *Anecdota*. Consult: Antonin Débidour, *L'Impératrice Théodora* (Paris, 1885); C. E. Mallet, "The Empress Theodora," in the *English Historical Review*, vol. ii (London, 1886); Charles Diehl, *Justinien et la civilisation byzantine au sixième siècle* (Paris, 1901); id., *Théodora, impératrice de Byzance* (3d ed., ib., 1904); Edward Gibbon, *Decline and Fall of the Roman Empire*, edited by J. B. Bury, vols. iv and v (new ed., 1912).

THEODORA (?-867). Byzantine Empress. She was born in Paphlagonia and in 829 married the Emperor Theophilus (died 842), whom she succeeded in the government as Regent for her four-year-old son Michael III. While her husband had been a violent iconoclast, she was attached to the worship of images, and consequently expelled the iconoclasts from office and recalled the banished image worshipers. She also convoked the Constantinople Synod of 842 which restored the images to the churches, a triumph annually celebrated in the Greek church by the Sunday of Orthodoxy (the first Sunday in Lent). Her rule was on the whole wise, but

some of her wars were unfortunate. When Michael came to the throne, in 856, he, influenced by his uncle Bardas, deprived his mother of her position and she died in a convent.

THEODORA. A member of the Roman nobility, who lived in the tenth century. She was very beautiful, of unknown parentage, wife of the consul Theophylact. She ruled Rome and controlled the papacy for a term of years, calling herself by the title of Senatrix. She was the mother of Marozia and Theodora II, who were equally licentious and unscrupulous. She placed several of her creatures on the papal chair, among whom John X may be specially mentioned. Consult Ferdinand Gregorovius, *History of the City of Rome during the Middle Ages*, translated by Annie Hamilton (London, 1895).

THEODORE, King of Abyssinia. See ABYSSINIA.

THEODORE I, King of Corsica. See NEUHOF, THEODOR VON.

THEODORE OF MOPSUESTIA (c.350-428). The most noted biblical scholar and theologian of the school of Antioch. He was born in Antioch, was educated under the rhetorician Libanius, and studied theology with Diodorus. At the age of 32 he was made presbyter of the Antiochian church, and in 392 he became Bishop of Mopsuestia, a small town in Cilicia, about 40 miles from Tarsus. In fame and influence he surpassed all the other Christian teachers and writers of the East. His biblical scholarship seems almost modern. His commentaries have in many cases perished, but enough remains to show his historical spirit, and the simple, literal method of interpretation which characterized the school of Antioch, as against the mystical, allegorical method of Alexandria. Theodore expounded almost all the books of the Bible. He also wrote on the incarnation and various other theological topics. Soon after his death, charges of doctrinal error began to be brought against him, and his opinions were condemned by the Council of Ephesus (431), though his name was not mentioned. He had no doubt favored the Pelagians, and the fact that he had been the teacher of Nestorius was afterward remembered against him. Opposition to his theology continued and increased until the fifth general council (Constantinople, 553), when he was explicitly condemned, in connection with the "Three Chapter Controversy." Part of the remains of Theodore's works are printed in Migne, *Patrologia Græca*, vol. lxi. The Latin version of his commentary on the minor Pauline Epistles has been edited by Svete (Cambridge, 1880-82), and the Syriac version of his commentary on John by Chabot (Paris, 1897). The best general account of Theodore in English is in *Smith's Dictionary of Christian Biography*, by Wace and Piercy (Boston, 1911). Consult also H. Kihn, *Theodore von Mopsuestia* (Freiburg, 1880); Bardenheuer, *Patrologie* (Eng. trans., St. Louis, 1908). For his theology, consult A. Harnack, *History of Dogma*, vols. iii, iv (Boston, 1898). See CHAPTERS, THE THREE.

THEODORE OF TARSUS (c.602-690). Archbishop of Canterbury. He was born at Tarsus; studied at Athens; became a monk; early distinguished himself as a scholar and was familiar with Greek and Latin literature; was consecrated at Rome as Archbishop of Canterbury by Pope Vitalian and arrived at his see May 27, 669. He did a great work for the

Church in England, which at the time of his coming had sunk to a low state. He divided his large dioceses into more manageable ones; appointed worthy bishops; promoted learning and clerical discipline; increased the monasteries; held progressive synods; and so left the Church a compact and enlightened body. His life is recorded in Bede, *Ecclesiastical History*. Consult G. F. Browne, *Theodore and Wilfrith* (London, 1897). See ENGLAND, CHURCH OF.

THEODORET (Gk. Θεόδωρος, *Theodōrētos*) (c.393-457). A Greek Church historian and biblical scholar. He was born at Antioch, of Christian parents. Theodoret, with Theodore of Mopsuestia (q.v.), is to be classed with the Antiochian school, as opposed to the Alexandrian. He was rational rather than mystical in his theology, and historical rather than allegorical in his biblical interpretation. He entered the monastic life at Apamea, and was loth to leave his monastery when made Bishop of Cyrus in Syria (423). Theodoret achieved great success in winning back to orthodoxy the survivors of the ancient Marcionites (see MARCION), and in suppressing the use of Tatian's *Diatessaron*, a compilation of the Gospels which had long been current in Syria. (See TATIAN.) His connection with the cause of Nestorius (q.v.), which began in his youth, continued until near the close of his life. He stoutly opposed Nestorius' condemnation at Ephesus (431) and denounced the famous Anathemas of Cyril, which had been launched against Nestorius shortly before. His own orthodoxy was seriously questioned, and the Robber Synod (449; see EPHESUS, COUNCILS OF) deposed him from his see, but he was reinstated by the Council of Chalcedon, two years later. Under great pressure by the Council of Chalcedon, Theodoret was finally prevailed upon to anathematize Nestorius, but he did it with the utmost reluctance, and it is doubtful whether his real opinion was ever changed. About 200 of his letters survive, giving valuable information on the events of his age. Most important perhaps of all his works is the *Ecclesiastical History*, written in continuation of Eusebius and bringing the narrative down to 428. His *Works* have been several times edited, e.g., by Schultze (Halle, 1769-74), and Migne, *Patrologia Græca*, lxxx-lxxxiv. An English translation of the *History*, *Dialogues*, and selected *Letters*, with valuable prolegomena, is given in *The Nicene Fathers*, edited by Schaff and Wace, 2d series, vol. iii (New York, 1892). Consult: Harnack, *History of Dogma*, vol. iv (Boston, 1898); Schubert-Moeller, *Lehrbuch der Kirchengeschichte* (Tübingen, 1902); Bright, *Age of the Fathers* (London, 1903).

THEODORIC I, King of the Visigoths (419-451). See GOTHs.

THEODORIC, thê-ôd'ô-rik (Lat. *Theodoricus*), surnamed THE GREAT (c.454-526). The founder of the Ostrogothic Kingdom in Italy. He was born on the banks of the Neusiedler See, in Pannonia. His father, Theodemir, was one of the three brothers who on the death of Attila (453 A.D.) freed their nation from the yoke of the Huns, and being the representatives of the royal line of the Amali, exercised a united sovereignty over it. In his eighth year Theodoric was sent as a hostage to the eastern Emperor and was trained in all kinds of athletic and martial exercises. He returned to his people about 471 and in 474 succeeded his father as

head of the nation. In the previous year the Ostrogoths had obtained parts of Mæsia and Dacia, as settlements, from the Emperor Zeno. For the next 13 years Theodoric was frequently engaged in strife, sometimes against the Empire, sometimes in its service. In 484 he was made consul, in 486 he was granted the honor of a triumph. The Emperor, to free himself from Theodoric, gave him permission to invade Italy, and the warlike monarch began his march in 488, and arrived early in 489 on the frontiers of Italy. Odoacer (q.v.), King of Italy, the first of the Germanic rulers of that country, was forewarned and forearmed; a desperate battle was fought near Aquileia (August, 489), the result of which was to the advantage of the Ostrogoths. A second and more disastrous defeat was inflicted on Odoacer near Verona (September 30), after which he took refuge in Ravenna; but having again gathered a large force, he was totally routed on the banks of the Adda (August, 490), and again blockaded in Ravenna, while the whole of Italy was being subdued; and having at last surrendered, was treacherously murdered (March, 493). Theodoric now assumed the title of King of Italy, resisted the claim of suzerainty preferred by the Eastern Emperor, and with the exception of a victorious campaign against the Franks, to stop their assaults on the Visigothic dominions, the suppression of a rebellion in Spain against the infant monarch, his own grandson Amalric (during whose minority Theodoric administered also the government of the Visigothic Kingdom), and an expedition against the robber hordes of the Bulgarians, the whole of his long reign was devoted to the consolidation and development of his new kingdom. His followers received only one-third of the public lands; private property was legally secured to the rightful possessors. He made Ravenna his capital, occasionally, when his northern frontier was threatened, removing to Verona.

Theodoric showed no desire of further conquest; cultivated the friendship and esteem of the surrounding nations; ruled all classes of his subjects with irresistible authority, but with corresponding justice and moderation; zealously promoted agriculture and commerce; and, himself an Arian, exhibited a tolerance of all other sects which was then almost unknown. The government was administered by Romans on Roman lines; separate codes of law were used for Romans and Goths. Theodoric left no son; but his daughter, Amalasuntha (q.v.), succeeded him as regent for her son, Athalaric. Theodoric became a hero of many Germanic legends under the name of Dietrich of Bern. Among the men who held office under Theodoric were Boëthius and Cassiodorus. The former, who had incurred the suspicions of the monarch towards the close of his reign, was unjustly put to death. Consult: Felix Dahn, *Die Könige der Germanen*, vol. iii (Würzburg, 1866); Thomas Hodgkin, "Ostrogothic Invasion," in *Italy and her Invaders*, vol. iii (London, 1885); id., *Theodoric the Goth* (New York, 1893); *Cambridge Medieval History*, vols. i, ii (New York, 1911-13); Edward Gibbon, *Decline and Fall of the Roman Empire*, vol. iv, edited by J. B. Bury (London, 1912).

THEODORIC, Tomb of. A structure near Ravenna, Italy, erected about 530 as a mausoleum by Theodoric's daughter. It is now the church of Santa Maria della Rotonda.

THEODOSIA, thē'ō-dō'shī-ā, or **FEODOSIA**, fē'ō-dō'sē-ā. A seaport of the Crimea. See KAFFA.

THEODOSIUS, thē'ō-dō'shī-us. The name of three Roman emperors.—**THEODOSIUS I**, surnamed **THE GREAT**, Emperor 379-395, was of Spanish descent, and was born either at Italica, or, more probably, at Cauca, near Segovia, about 346. His father, also named Theodosius, was the great general of the Roman Empire, who, after freeing South Britain from the Caledonians, and annihilating the formidable rebellion of the Moor Firmus, was beheaded at Carthage in 376. Theodosius accompanied his father in his British campaigns, and afterward, by routing the Sarmatians, saved Mæsia from devastation, but retired from active service after his father's murder, and took up the care of his patrimonial lands in Spain. But on the defeat and death of Valens (q.v.), his colleague, Gratianus (q.v.), feeling his inability to sustain alone the cares of empire, intrusted to Theodosius, Jan. 19, 379, the administration of Thrace, Dacia, Macedonia, Egypt, and the East, and especially the protection of the Empire against the Goths. Theodosius found it most prudent to sow jealousy and dissension among the Goths by promises and bribes, and, after a four years' so-called campaign, succeeded in pacifying the Visigoths, the Ostrogoths retreating towards Scythia. The latter returned in 386, their ranks swelled by Scythians, but were totally routed in attempting to go across the Danube, and the survivors were transported to Phrygia and Lydia. See **GOths**.

In 387 Theodosius undertook to restore to the throne of the Western Empire Valentinian II (whose sister Galla he married), the brother of Gratian, who had been expelled by Maximus, and after a successful contest captured Maximus and put him to death at Aquileia (388). In 392 the suspicious death of Valentinian and the elevation of the puppet Eugenius by Arbogastes, the real ruler of the West, again made Theodosius interfere; after two years of preparation his army gained a complete victory over the army of the West, and the two portions of the Roman Empire were again united under one ruler. The union lasted only four months, owing to the death of Theodosius, Jan. 17, 395. Though he professed the orthodox Christian faith, Theodosius was not baptized till 380, and his behavior after that stamps him as a cruel and vindictive persecutor. His humiliation before St. Ambrose, Bishop of Milan, for the massacre at Thessalonica, was regarded by the Church as one of its greatest victories over the temporal power. See **AMBROSE**.

THEODOSIUS II, Emperor of the East from 408 to 450, was the only son and successor of Arcadius (q.v.). He was but seven years old when he ascended the throne. The chief events of his reign were the invasion of the Empire by the Huns under Attila, a war with Persia, renewed efforts to extirpate paganism, and the compilation of the *Code Theodosianus* (see **CODEX**; **CODE**).—**THEODOSIUS III** was an unimportant Byzantine Emperor (716-717 A.D.), who abdicated after a few months' reign. On all three consult Edward Gibbon, *The Decline and Fall of the Roman Empire*, edited by J. B. Bury (London, 1912); Thomas Hodgkin, *Dynasty of Theodosius I* (Oxford, 1889); id., "Visigothic, Hunnish, and Vandal Invasions," in *Italy and her Invaders*, vols. i, ii (Oxford,

1892); *Cambridge Medieval History*, vol. i (New York, 1911).

THEODOSIUS, ARCH. OF. A triumphal arch at Rome, erected in 405 A.D. at the approach to the Pons Vaticanus, in honor of the three emperors Arcadius, Honorius, and Theodosius, in commemoration of their destruction of the Goths.

THEOGNIS (Lat., from Gk. *Θεόγνυς*) (sixth century B.C.). A Greek elegiac poet, born at Nisæan Megara. During the conflict in his native city between the aristocratic and democratic parties, in which he took the side of the aristocrats, he lost his estate and was reduced to poverty and driven into exile. He appears to have visited Sicily, Boeotia, Eubœa, and Sparta, but later, apparently under changed conditions, he returned to his native city. Theognis is the only elegiac poet whose works have come down to us in anything like complete condition. We possess under his name 1389 verses, in two books, which set forth the political belief and ideals of the Dorian oligarchs. The work is fragmentary and has suffered largely from interpolations. The genuine remains of his work are valuable evidence as to the state of political parties and social conditions in the sixth century. The fragments are edited by Bergk in his *Poetæ Lyrici Græci* (5th ed., Leipzig, 1914); by Ziegler (2d ed., Tübingen, 1880); by Sitzler (Heidelberg, 1880); by Hartmann in his *Studies in Theognis* (Cambridge, 1902); and by T. Hudson-Williams (1910). Consult W. C. Wright, *A Short History of Greek Literature* (New York, 1907); Christ-Schmid, *Geschichte der griechischen Literatur*, vol. i, part i (6th ed., Munich, 1912).

THEOGONY (Lat. *theogonia*, from Gk. *θεογονία*, from *θεός*, *theos*, god + *-γονία*, *-gonia*, generation, from *γόνος*, *gonos*, seed). A genealogy of the gods. The earliest theogonies among the Greeks were that of the epic cycle, of unknown authorship, now lost, and the extant work of Hesiod (q.v.). According to Pausanias, the poems of Onomacritus, who lived at the close of the sixth century B.C., belonged to this class. The Orphic theogony, which had a great influence among the Neo-Platonists, was composed at a late period, although it may have embodied much of the earlier Orphic doctrine.

THEOLOGICAL ANTHROPOLOGY. See ANTHROPOLOGY, THEOLOGICAL.

THEOLOGICAL EDUCATION. The system of training in theology, with special reference to professional preparation for the work of the ministry. It will naturally have to be considered under two main heads, owing to fundamental differences in the point of view.

THE CATHOLIC SYSTEM

The older system of theological education, prevailing in Catholic institutions, is the result of the historical development of the Church. The aim and ideal have remained unchanged, but the matter has broadened and the lines widened and deepened according to the Church's organic activity. The training of the man has ever been its most important function—consisting in the assimilating of his mind to the object matter of theological disciplines and of his conduct to the ideal of the priestly vocation. The first theologians were instructed in the school of Christ. They in turn handed on to their disciples what they had received from their master. Its matter was the Bible, the Old and New Testament, the latter especially, with the

oral interpretation gathered and treasured from the instructions of Jesus. The form was simple, unsystematic, adapted to the synthetic rather than the analytic mind. Both aspects—the matter and the form—are indicated with sufficient detail to enable one to estimate their character in the letter of St. Paul to Titus and his two letters to Timothy. Contact with Judaism developed a more definite exegesis, and conflict with paganism a direct apologetic. The necessity of defining and defending the explicit content of revelation resulted in a gradual growth of dogmatics, with a well-marked branch of polemics, while the bearings of the new religious-moral truths on the growing complexities of life in the world and the cloister necessitated an unfolding of moral and ascetical theology. Eusebius in the meantime had founded ecclesiastical history, and with the Decretists and the Decretalists canon law received an organic shape. After the collapse of the Roman Empire educational activity, theological as well as secular, was practically confined to the monasteries, and limited to the conserving of the materials inherited from the past.

Throughout the Middle Ages the various branches of the theological curriculum became more systematic and coördinated. Biblical study was emphasized, though principal attention was given to the philosophico-theological systematization of the speculative content of religious faith and to the motives, faculties, and laws of moral and religious conduct. Historical and critical studies were at this time but superficially cultivated.

A great change begins with the rise of the Humanists and the Reformation, followed by the opposite reform instituted by the Council of Trent. Progress lay principally in the circle of biblical and historical studies. Exegesis was pursued with great zeal, and the study of the Bible centred mainly on historico-critical questions. The founder of isagogics as a special discipline was Richard Simon, and in the second half of the eighteenth century, in which, besides, the division of theology into separate departments was completed, it was marked off against the rest of biblical science. In church history, reestablished by Baronius (1607), the auxiliary sciences attained chiefly through the Benedictines of St. Maur their form and demarcation: patrology, archaeology, and chronology. In criticism of sources Mabillon (1707), in the study of the Catacombs Bosio (1639), in hagiography Bollandus (1665), were most prominent. Besides these Petavius (1652) and Thomassin (1695) established scientifically the history of dogma, which since the latter half of the eighteenth century has been independent. In systematic theology, moral theology, which had made great advance, separated definitely from dogmatic and was raised to an independent discipline. Casuistry received particular interest and care. In dogmatics Melchior Cano (1560) created by his *Loci Theologici* the science of theological noetics, to which Stapleton (*De Principiis Fidei Doctrinæ*) gave scientific finish. In post-Tridentine dogmatics, polemics took a broad and important place. To it men like Bellarmine, Suarez, and Soto devoted their best powers. Mystics and ascetics, earnestly cultivated even in patristic times (their founder was the Pseudo-Dionysius), were greatly developed, but attained no independent position. They remained, like casuistics, in connection with and

in the service of moral theology. Thus the theological cycle was, at the close of the sixteenth century, divided into the following departments: biblical science (undivided), church history, dogmatics, moral and canon law. The differentiation of the other theological disciplines was accomplished only in the second half of the eighteenth century. The latest to appear as a separate branch was pastoral theology, in Germany, with the erection of a special chair for its teaching under Maria Theresa. Later on it divided into three departments: homiletics, liturgics, and the theory of the pastoral life. Apologetics, as fundamental theology, though zealously cultivated for centuries, separated from dogmatics only in the nineteenth century.

The actual curriculum of the ecclesiastical, or the diocesan seminary, in which the system of theological education is imparted, dates in its present organization from the Council of Trent, but is the outcome of a gradual historical growth. In the early centuries theological education was received partly at central schools (e.g., at Alexandria and Antioch), but chiefly at the Bishop's residence under his guidance and spirit. The episcopal school was afterward supplemented by the monastic institutions and the schools established by Charlemagne. These in turn were succeeded by the great mediæval universities and the *collegia* attached thereto. The growing laxity of discipline at these institutions induced the Council of Trent to establish the present seminary system. The purpose of these institutions, which exist in almost every diocese or ecclesiastical province, is primarily a moral one. The graded course of study pursued in them averages from 10 to 12 years, divided into three distinct but closely connected stages: the preparatory, the philosophical, and the strictly theological, to which the first two are subordinate. In the preparatory department, special importance is placed on Latin. As this language is the vehicle of most of the subsequent studies—textbook and lecture being usually in Latin—the student passing from the preparatory seminary is required to have an easy reading familiarity and a fair speaking facility in the language. The two years of philosophy are devoted to logic, psychology, metaphysics, and ethics (including sociology), the physical sciences, Hebrew, and Greek. The theological curriculum of four years is organized as follows:

I. *Theology in its Unity (Synthesis)*.—1. The theologian: his ideal, moral, and intellectual equipment. 2. Nature, origin, and classification of religion. 3. Relation of theology to religion. 4. Object, nature, relations (to reason and faith), history of theological science.

II. *Departments of Theology (Analysis)*.—A. *Historical*.—1. The Bible, criticism, exegesis. 2. Biblical theology: (a) history of the Old and New Testament; (b) their general doctrinal contents; (c) aids to study: biblical philology, archaeology, hermeneutics. 3. Church history: (1) scope, methods, epochs; (2) divisions: (a) patology; (b) symbolism; (c) ecclesiastical archaeology and art; (d) auxiliary disciplines: geography and statistics, ecclesiastical chronology, and philology.

B. *Systematic Theology*.—1. Apologetics. 2. Dogmatics, relations to morals. 3. Moral theology (Christian ethics).

C. *Practical Theology*.—1. The Christian pastorate as a continuation of Christ's ministry.

2. Divisions: catechetics: pastoral didactics; the instruction of children. 3. Homiletics: theory of sacred eloquence. 4. Liturgy. 5. Theory of the relations of pastor and people.

D. *Canon Law*.—Science of ecclesiastical discipline.

In the philosophical department empirical psychology, epistemology, and sociology are absorbing more interest and are being pursued in a more historical light and a more critical spirit than was the case a generation ago. The same is true of biblical studies, ecclesiastical history, and apologetics within the theological domain.

There is no attempt at reconstructing theology. The primary principles of that system are the articles of faith contained within the deposit of revealed truth, which, together with the assurance of inerrancy in discerning, formulating, and interpreting them, she claims to have received from her Founder. In the exercise of the logical faculty developing those principles and coördinating the conclusions into a systematic body of theological science, in the work of the critical faculty within the domains of biblical, historical, and scientific studies, she recognizes the fullest rights of human reason, provided it does not usurp the license of transgressing the ascertained manifestations, divine revelation.

THE PROTESTANT SYSTEM

The great leaders of the Protestant Reformation insisted upon the necessity of higher education for the clergy at the universities. This was natural, as they believed in an established church supported by the state, and strongly emphasized the duty of its ministers to inculcate sound doctrine, which necessitates special theological training. The Anabaptist thinkers, who contended for freedom of conscience, liberty of prophesying, and complete separation of church and state, put the emphasis so strongly upon experience and conduct as to make doctrinal agreement a matter of secondary importance, and the education of a special clerical class seem undesirable. It was fortunate that the prevailing tendencies made a home for Protestant theology at the great centres of intellectual life. The theological curriculum at the universities was changed in several respects, particularly by the greater attention given to the biblical studies, the importance attached to the Hebrew and Greek texts, and the more or less determined abandonment of the allegorical method of interpretation. Other Lutheran universities modeled their course upon that prescribed by Luther and Melancthon at Wittenberg. Between 1529 and 1563 this system was introduced at Marburg, Tübingen, Leipzig, Königsberg, Greifswald, Heidelberg, Jena, Rostock, Upsala, and Copenhagen. Similar courses of theological study were established by Beza at Lausanne, by Calvin at Geneva, and theological schools at Nîmes, Sedan, Saumur, and Montauban followed the same methods. In Holland the University of Leyden (founded 1575) became the centre of Protestant theology. The Free Church in Scotland established three divinity halls at Edinburgh, Aberdeen, and Glasgow, and the theological education at the universities of St. Andrews, Aberdeen, and Glasgow was likewise modified in character. Cambridge, under the teachings of Erasmus, Tyndale, and Latimer, became the foremost exponent of the new theological as well as humanistic teaching,

and Vermigli at Oxford expounded Protestant principles of exegesis.

If the theological education of the Reformation period was chiefly characterized by the greater attention paid to the Bible, and a certain movement of thought away from Catholic dogma, its most marked peculiarity in the immediately succeeding period was the inculcation of Protestant dogma, on which a growing emphasis was placed. In Germany the type of teaching represented by Flacius proved more acceptable than that of Melancthon and his followers, and Calovius bore off the victory over Calixtus and the Helmstedt school. The greatest service rendered by Flacius was the attention he and the other Magdeburg Centuriators paid to the history of the Church. New centres of theological study were created at Giessen, Kiel, Dorpat, Lund, Grüningen, and Utrecht. In Holland the extreme orthodox tendencies prevailing at the Synod of Dort were offset by the influence of Scaliger and Grotius. In the French schools Cameron, Amyraut, and Louis Cappel maintained a more liberal type of thought. The expatriation of the Huguenots left only Montauban as a Protestant school. In England the theological education was less affected by exaggerated doctrine concerning the Bible than was the case in Germany, Switzerland, and Holland. The Colonies were long supplied by ministers who had had their training in European universities. A professorship in divinity was established at Harvard College in 1638, and a similar professorship was inaugurated at Yale in 1740.

A new direction was given to theological education by the Pietist movement. At Halle a university was founded in 1694, where it was possible for Spener and Francke to exemplify their principles. They maintained that the Christian minister must himself have a profound religious experience, that he should not be bound by an oath to teach in accordance with man-made creeds, but that he should proclaim the word of God contained in the Scriptures. In the *seminarium ministerii ecclesiastici* established at Halle in 1714 Francke endeavored to give to converted men such a knowledge of the Bible and such an acquaintance with the practical duties of the pastor as to fit them to be true spiritual leaders. While the demand for a spiritual crisis rather than a normal growth of religious experience could not be carried out in a state church and had a tendency to foster self-deception, the break with dogmatism and the centring of interest upon the practical aspect of the ministry, bore permanent results. The loosening of dogmatic fetters led to biblical criticism, as is seen in Dippel, Edelmann, Michaelis, Zinzendorf, and Semler, and a new estimate of the history of the Church, doing more justice to the heretical bodies, was introduced by Gottfried Arnold.

At the English universities rationalism exercised a greater influence than pietism. This was largely the result of the zealous cultivation of natural science. The idea that revelation itself is to stand or fall by the test of reason was accepted by the apologists as well as by the Deists, by Lardner and Paley not less than by Collins and Toland. From England this rationalistic movement spread to the Continent. In the school of the Remonstrants at Amsterdam, J. C. Clerc expounded to theological students the principles of Collins and Locke. Göttingen was

established in 1737, largely to serve as a bulwark against supernaturalism, and other centres of rationalism were Jena, Helmstedt, and Heidelberg. Theological students came under the influence not only of Eichhorn, Paulus, and Henke, but also of such men as Reimarus and Lessing, Herder and Goethe, Kant and Fichte. Each movement had its value. Pietism laid stress upon the consciousness of an inner change, and tended to the supremacy of religious emotion; rationalism put the emphasis upon the reasonableness of true religion and the supremacy of morality.

During the nineteenth century certain important changes occurred. A large number of schools grew up in Europe and America. In Germany the most important additions were the universities of Berlin (1810), Bonn (1818), and Strassburg (reorganized 1871). In Switzerland schools unsupported by the state have been established at Geneva, Lausanne, Neuchâtel, Basel, Bern, and Zurich, and state universities teaching theology at Fribourg and Neuchâtel. In France the theological faculty of the University of Strassburg was removed to Paris in 1877, and the Ecole des Hautes Etudes was founded in 1868. The University of Amsterdam was established in 1877, and universities were founded in Christiania in 1813, and Helsingfors in 1827. In England, besides Oxford, Cambridge, and Durham, the Church of England has 23 theological schools, the English Methodists 10, the Congregationalists 11, the Baptists 9, the Presbyterians 3, the Unitarians 1, and two are undenominational. Except the Dutch Reformed Seminary at New Brunswick, N. J. (1784), and the United Presbyterian Seminary at Xenia, Ohio (1794), all Protestant schools of theology in the United States were founded in the nineteenth century. They number about 120. When the large extent of territory, the numerous denominations, and the special needs of the colored and the foreign churches are considered, the number is not excessive, although many of them are still very inadequately equipped. Some of the schools are connected with universities. Many are located in or near important educational centres. The course is generally three years in length, and a collegiate training is as a rule required for admission.

A tendency to seek independence of educational control is characteristic of the period. In Germany, Switzerland, Holland, and France the principle of academic freedom has won general recognition. Berlin at the outset repudiated all attachment to any particular creed or school. While pressure is often brought to bear in the matter of appointments, the tradition of a German university is generally the determining feature. In Holland the relations between pulpit and chair are more cordial. In England and Scotland freedom of investigation is now generally granted to the biblical teachers. In the United States and Canada theological schools arose under the control of the denominations, and only a few, like Harvard and Union Seminary, are yet independent. In some schools the connection has become more nominal than real, and there is freedom of teaching, while the students are drawn from various denominations, as in Yale and the University of Chicago. Some others are strictly denominational schools. The advantages of university connection have drawn schools into affiliation with universities, as

Harvard, Chicago, Columbia, Pennsylvania, California, and others.

The most significant change in theological education during the century was the general introduction of historico-critical methods of investigation. In the interpretation of Hebrew and early Christian literature, and the study of Church history, German theological teachers have been the chief leaders; but, owing to the relations of the faculties to the Christian state as well as to the Church, no provision is yet made in any German university for the comparative study of the religions of mankind. Paris offers the amplest facilities for such study, but Leyden and Amsterdam also pay considerable attention to it. Critical methods prevail in Old Testament exegesis in Great Britain and America, as well as in the European universities. There is less consistency in their application to New Testament exegesis. The treatment of ecclesiastical history is characterized by increasing fairness and objectivity. While many contributions have been made to dogmatics by theological teachers, the acceptance of the results of criticism has tended to render impossible the old type of systematic theology. As an attempt to explain the Bible, biblical theology has taken its place. As a statement of the meaning of creeds, the history of doctrine supplies its place. As an attempt to bring all truth into one system, it becomes a statement of philosophy and religious psychology. Theology has been enlarged from a system of reason supported by proof texts to a religious philosophy of the world, based on the whole range of natural science and human experience. The broadening view of religion has also caused a new emphasis on religious education and social subjects.

THEOLOGICAL SEMINARY OF THE REFORMED CHURCH IN AMERICA. A divinity school at New Brunswick, N. J., organized in 1784. Its classes were held in New York City until 1796, then at Flatbush, L. I., for a year or more, and again in New York, till 1810, when it was removed to its present home. The seminary is under the direct control of the General Synod of the Reformed church. Its theology is in sympathy with the moderate Calvinism of the Reformed church standards. The school has a well-equipped dormitory, Peter Hertzog Hall; a capacious building, James Suydam Hall, devoted to lecture rooms, museums, and gymnasium; a fire-proof library in the Gardner A. Sage building, containing in 1915 over 52,000 volumes; and five dwelling houses for professors. In 1915 the endowment of the seminary was over \$650,000, and the attendance was 29, with a faculty of eight instructors. The president in 1916 was J. P. Searle.

THEOLOGY (Lat. *theologia*, from Gk. *θεολογία*, a speaking concerning God, from *θεός*, *theos*, god + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). A term which, in the larger sense, may be used as equivalent to the science of religion, and will then include all the various theological disciplines, the sacred languages, and the interpretation of the Bible; the history of the Church, including the history of doctrine; the history of religions in general; the contributions of our own age to the knowledge of the objects of theological study from other sciences, such as biology; systematic theology, or the system of doctrines and duties; and, finally, practical theology, or the application of theology to life, in the pulpit, in Church administration, and in the various forms of contact with the world. But more strictly and correctly, the term "theology" is employed at present of systematic theology, which may be defined as the science of Christianity, or the scientific explanation of the Christian life, the development of its characteristic principles, conditions, and general relations. Viewed thus it yields a system of doctrines and a system of duties, or dogmatics and ethics. The term was used in the early and mediæval Church in a narrower sense, to mean the specific doctrine of God, the rest of the field now covered by the word being called sacred doctrine. This is the meaning of it as late as Aquinas.

The claim of theology to be a science depends upon the question whether there are any peculiar facts of which it takes cognizance, as it professes, and whether its method is calculated to yield reliable knowledge. It claims as its field two classes of facts—Christian experience and the teachings of the Bible. In method, theology has followed, with other sciences, the prevailing methods of thought in the various ages. In earlier times this was a priori, and the general conservatism of everything connected with religion tended to retain the a priori method as long as possible, but in modern times theology uses the modern methods of inductive reasoning, desiring to find the truth rather than, as in scholasticism, to prove traditional doctrines.

Formerly a sharp distinction was drawn between natural and revealed theology. The former embraced those doctrines as to God, freedom, and immortality which could be reached without the aid of revelation, and upon them was built the proof of the Bible as a revelation from God, and consequently the system of revealed theology, which was then conceived as exclusively the scientific interpretation of the Bible. But with the increasing evidence that even the first doctrines of natural theology, such as the existence of God, have been historically dependent upon a human experience which may be regarded as revelation, and that the doctrines of revealed theology have their confirmation in facts drawn from other sources than the Bible, the sharp line between the two departments has been largely erased. Natural theology is now replaced by apologetics, the business of which is to defend the doctrines developed by systematic theology.

THEOLOGY, NATURAL. See NATURAL THEOLOGY.

THEOLOGY, PATRISTIC. See PATRISTIC THEOLOGY.

THE'ON (Lat., from Gk. Θέων) OF **ALEXANDRIA** (c.370 A.D.). One of the last of the Greek mathematicians and astronomers. He was a teacher at Alexandria and the father of the celebrated Hypatia (q.v.), whose name is also connected with the history of mathematical science. Theon's chief works are an edition of Euclid's *Elements* and a commentary on Ptolemy's *Almagest*. The former was prepared for his students at Alexandria and the various manuscripts have played an important rôle in all subsequent attempts to reproduce the *Elements*. The latter is especially valuable for its notes showing the use of sexagesimal fractions and the operations of division and square root.

THEON OF SMYRNA, smēr'ná (c.100 A.D.). A Greek mathematician and astronomer. He

was the author of a work, commonly known as the *Expositio*, treating of mathematical rules necessary for the study of Plato. Two books of this work, probably the whole of it, are extant, one on arithmetic and the other on astronomy. The work contains two propositions on the theory of numbers of peculiar interest: (1) If n is any number, n^2 or $n^2 - 1$ is divisible by 3 or 4 or both. If n^2 is divisible by 3 and not by 4, $n^2 - 1$ is divisible by 4. (2) If two groups of numbers are arranged as follows:

$$\begin{array}{ll} n_1 = 1 + 0 & d_1 = 1 + 0 = 1 \\ n_2 = 1 + 1 & d_2 = 2 + 1 = 3 \\ n_3 = 2 + 3 & d_3 = 4 + 3 = 7 \\ n_4 = 5 + 7 & d_4 = 10 + 7 = 17 \\ \dots\dots\dots & \dots\dots\dots \\ n_r = n_{r-1} + d_{r-1} & d_r = 2n_{r-1} + d_{r-1}, \end{array}$$

then d^2 is of the form $2n^2 \pm 1$; e.g., $d_1^2 = 1 = 2 \cdot n_1 - 1$, $d_2^2 = 9 = 2 \cdot n_2 + 1$. Theon called these numbers *diameters*. It is interesting to observe that the ratios

$$\frac{d_1}{n_1} = 1, \frac{d_2}{n_2} = \frac{3}{2}, \frac{d_3}{n_3} = \frac{7}{5}, \dots$$

are the convergents of the continued fraction

$$1 + \frac{1}{2 + \frac{1}{2 + \frac{1}{2}}}, \dots$$

and hence approximate the value of $\sqrt{2}$; also that these diameters are solutions of a pair of indeterminate quadratic equations, relations unknown to Theon. See PELL, with reference to the Pell Equation.

THEOPH'ANO (c.955-91). The wife of Otho II of the Holy Roman Empire. She was the daughter of the Byzantine Emperor Romanus II, and was married to Otho II at Rome in 972. She was a woman of great beauty and noble character and soon won great influence over the Emperor, in whose court she introduced much of the learning and refinement of Constantinople. After the death of her husband (983) she ruled as Regent for her son Otho III till her death.

THEOPH'ANY (ML. *theophania*, *theofania*, from Gk. θεοφάνια, *theophania*, θεοφάνεια, *theophaneia*, from θεός, *theos*, god + φαίνεσθαι, *phainesthai*, to appear). An appearance of gods, or of God, to men. In the heathen religions theophanies under various forms were regarded as of frequent occurrence. In Christianity the term was often applied in the ancient church to the appearance of God in Christ, in distinction from the *epiphany*, which was the appearance in the form of a dove, and the audible communication of God, at the baptism of Jesus (Mark i. 9-11 and parallels). It is now generally restricted to the appearances of God as related in the Old Testament, whether in personal form or by any other means.

THEOPHILUS, thē-ōfī-lūs (from Gk. Θεόφιλος, beloved of God). The name of the person to whom two New Testament books, the third Gospel and the Acts, are dedicated (Luke i. 3; Acts i. 1). In Luke i. 3 he is addressed as "most excellent" (Gk. *κράτιστε*), from which one would naturally infer that he was a man of rank or high position, but not necessarily (cf. Ramsay, *St. Paul the Traveler*, p. 388 f.) a Roman official of equestrian rank. The natural inference from Luke i. 4 is that he was a convert to Christianity, having already received the instruction usually imparted to new converts.

The name Theophilus was not uncommon in Jewish circles, being borne by a high priest who held office 37-41 A.D. (cf. Josephus, *Ant.*, xviii, 5, 3; xix, 6, 2), and even as early as c.254 B.C. it was held by a member of a Samaritan community in Egypt (cf. Deissmann, *Bibelstudien*, p. 19). The Jews may have considered it the equivalent of the Heb. El-dad (probably "beloved of God"), but it was in use also as a pure Greek name long before the Christian era. Hence one should not infer that Theophilus must have received this name as his Christian name when baptized. Nothing whatever is known of his history, not even his place of residence.

THEOPHILUS. The hero of a mediæval legend, which became a precursor of the Faust legend. The facts appear to be that in the sixth century there was a Theophilus who was treasurer of the church at Adana, near Tarsus, in Cilicia Secunda. He was elected Bishop, but refused the honor, out of humility. Later he quarreled with the new Bishop, but on repentance was forgiven. These facts were embellished by later story-tellers, until the legend arose that the devil tempted and finally won him, making him sign a contract, with his blood, to give his soul in exchange for the glories of this world. Later he repented and prayed to the Virgin, who then tore the parchment from the very claws of Satan and returned it to Theophilus. This act became one of her celebrated miracles. The legend was brought to the West in the tenth century, and quickly spread far and wide. It was made the subject of poems and dramas in many languages, and frequent allusions to it are found in Latin, German, Anglo-Saxon, Icelandic, Swedish, French, and Spanish literature, while it is also the subject of many celebrated sculptures, particularly some in Notre Dame, Paris.

THEOPHRASTUS (Lat., from Gk. Θεόφραστος) (c.372-287 B.C.). A Greek philosopher, born at Eresus in Lesbos. He studied philosophy at Athens, first under Plato and subsequently under Aristotle, who at his death made him head of the Peripatetic school, which he directed for 35 years (322-287). Under his leadership the character of the school was well maintained; it had a large number of pupils, and enjoyed a high reputation at home and abroad. In philosophy he followed closely in the footsteps of his master, but was more inclined to natural history than to metaphysics. His discourses on ethics were greatly admired, but his chief renown was gained by his botanical works. Two of these, his *History of Plants*, in nine books, and his *Theoretical Botany*, in six, are still extant, together with fragments of his work *On Mineralogy* (Περὶ Αἰθέρων), *On Fire* (Περὶ Πυρός), *On the Senses* (Περὶ Αἰσθησέων καὶ Αἰσθητῶν), *Metaphysics* (Μεταφυσικά), and other similar subjects. Especially famous is his book of sketches called *Characters* (Χαρακτῆρες). They have been extremely popular and have been imitated many times, especially by the French and English of the eighteenth century. The best complete editions of his works are by Schneider (Leipzig, 1818) and by Wimmer (Paris, 1866). The *Characters* have been many times edited separately. Especially famous are the edition by Casaubon with commentary (Leyden, 1592); that by R. C. Jebb (London, 1870; revised by J. E. Sandys, 1909); and the edition, with translation and commentary, by the Leipzig Philological Society (1897). Consult: Eduard Zeller, *Aris-*

totle and the Earlier Peripatetics (Eng. trans., London, 1897); Theodor Gomperz, *Greek Thinkers*, vol. iv (Eng. trans. by G. G. Berry, New York, 1912); H. Ritter and L. Preller, *Historia Philosophiæ Græcæ* (9th ed., Gotha, 1913).

THEOPHYLACT (Gk. Θεοφύλακτος, *Theophylaktos*) (died c.1107). A Bible commentator. He was a deacon at Constantinople and became tutor to Constantine Porphyrogenitus, son of Michael VII. In 1078 Theophylact was made Archbishop of Achrida and Metropolitan of Bulgaria. He labored diligently to extend Christianity, but was hindered by the half-civilized people of his diocese, and vainly endeavored to lay down the duties of his office. He wrote valuable commentaries on the minor prophets and on the greater part of the New Testament. In addition he wrote 130 epistles and a number of tracts, including one on *Education of Princes*. His commentaries are founded on those of Chrysostom (q.v.). His exegesis is direct, precise, and textual in its treatment. His works were much esteemed by later writers. J. F. B. M. de Rossi published his works in Latin and Greek at Venice in 4 folio volumes (1754-63). Consult Karl Krumbacher, *Geschichte der byzantinischen Litteratur* (2d ed., Munich, 1897).

THEOPHYLLINE. See ALKALOIDS.

THEOPOMPUS (Lat., from Gk. Θεόπομπος) **OF CHIOS** (c.378-c.300 B.C.). A Greek historian. In early life he left home with his father, who was banished on account of his predilection for the Spartans, and took refuge in Athens. There he was trained in oratory by Isocrates. Besides numerous panegyrics, of which that on Mausolus was the most celebrated, his works included *Σύνταξις Ἑλληνικῶν*, or *Ἑλληνικὰ Ἱστορία*, a *History of Greece* in 12 books, embracing the period from 411 B.C., where Thucydides breaks off, to the battle of Cnidus, in 394; and *Φιλίππικά*, in 58 books, a history of the life and times of Philip of Macedon. Of these works only fragments remain, but an abridgment of the Latin translation of the *Φιλίππικά*, by Trogus Pompeius, has been preserved by Justin. Ancient critics commend his accuracy, but blame him for harshness and illiberality. This was due to his fearless exposition of the corruption of his day. According to Pliny, the Elder, he was the first Greek writer to make any definite mention of Rome. For the fragments, consult Müller, *Fragmenta Historicorum Græcorum* (Paris, 1841); Bünger, *Theopompea* (Strassburg, 1874); and a complete edition, including the fragments of Cratippus by Grenfell and Hunt, in *Hellenica Oxyrhynchia* (Oxford, 1909). Consult Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i (5th ed., Munich, 1908); J. B. Bury, *The Ancient Greek Historians* (New York, 1909); E. M. Walker, *The Hellenica Oxyrhynchia* (Oxford, 1913).

THEORBO (It. *tiorbo*, etymology unknown). An obsolete musical instrument of the lute family, of which it formed the bass. Besides strings running over the finger board, it had a number of bass strings stretched alongside of the board. These strings were longer and were fastened in a separate neck attached to the neck containing the strings stopped by the fingers. The theorbo was indispensable in the orchestra of the seventeenth century and was used for accompanying the voice. See PLATE OF MUSICAL INSTRUMENTS.

THEOREM (Lat. *theoremata*, from Gk.

θεωρημα, sight, principle considered, rule, theorem, from *θεωρεῖν*, *theōrein*, to view, from *θεωρός*, *theōros*, spectator, from *θεᾶσθαι*, *theasthai*, to view, behold). In mathematics, a proposition to be demonstrated. A theorem consists of two parts: the hypothesis, or the given, and the conclusion, or what is to be proved. One theorem is the converse of another when the conclusion and the hypothesis are interchanged in the two theorems. The converse of a theorem is, however, not necessarily true. A corollary (q.v.) of a theorem is a truth easily deduced from it and not requiring a separate demonstration. A lemma (q.v.) is generally a theorem used to prepare the way for another theorem.

THEORY. See **HYPOTHESIS**.

THE'OSOPHICAL SOCIETY. A society founded by Helena Petrovna Blavatsky (q.v.) in New York, Nov. 17, 1875, assisted by Col. Henry S. Olcott, William Q. Judge, and others. Its objects were: (1) to form the nucleus of a universal brotherhood of humanity; (2) to study and make known the ancient religions, philosophies, and sciences; (3) to investigate the laws of nature and to develop the divine powers latent in man. Blavatsky left New York, Dec. 17, 1878, and went to India, accompanied by Colonel Olcott, where a system of propaganda was organized and numerous branches were formed. Judge remained in New York, and built up the society in the United States. He formed a strong branch, the Aryan Theosophical Society, in New York City, of which he was president. Madame Blavatsky left the Theosophical Society as an international body with headquarters at Adyar, India, and with three sections: the Indian, comprising the Orient; the English Section, having jurisdiction over Europe; and the American Section for America. Olcott, at Adyar, was president; Judge, at New York, vice president. Each section had a general secretary—Bertram Keightley, of Adyar, of the Indian; G. R. S. Mead, of London, of the English; and Judge, of New York, of the American Section. There was an inner body, the Esoteric Section (E.S.), at the head of which was Madame Blavatsky. At her death, in 1891, she was succeeded by Judge and by Annie Besant, of London, jointly, both supposedly mouthpieces of an unknown master, the real head of the theosophical movement. Charges of fraudulent use of this master's name were preferred against Judge by Mrs. Besant. These charges, though never legally proved, caused a split between the supporters and opponents of Judge. In Boston, in April, 1895, the American Section almost unanimously declared its autonomy as the "Theosophical Society in America" (T. S. in A.), with Judge as president. It then had about 150 branches, and in 1916 it had 157 branches with about 5000 members. In so far as these members belonged to the Esoteric Section, they recognized Judge as the outer head (the real head being the unknown master), and, following their example, those Theosophists throughout the world who believed the charges false formed independent bodies in their separate countries, called respectively the Theosophical Society in England (T. S. in E.), in Sweden (T. S. in S.), in Australia, etc.

The society under Olcott kept up its organization, though the English and American sections were much weakened. Mrs. Besant remained the head of that Esoteric Section which was connected with the society under Olcott. Judge

died March 19, 1896, leaving his society in a flourishing condition, but with no successor as head of the Esoteric Section, or the T. S. in A. Katherine A. Tingley then obtained recognition, first from a few members, and through skillful advances from the bulk of the society, as the successor of Blavatsky and of Judge. At a convention in Chicago, in February, 1898, she formed "The Universal Brotherhood Organization," of which she was the absolute ruler, and the possessor of all its property. Of the remnants of the T. S. in A. she made a literary department of her "Universal Brotherhood." The headquarters in New York City were abandoned and she took her remaining followers, not more than a dozen of the old members of the T. S. in A., to Point Loma, near San Diego, Cal., where she formed a colony. The Theosophical Society in America, after Tingley's departure for Point Loma, soon divided, one of the sections having headquarters in New York and the other in Brooklyn. The theosophical movement continues, however, on the one hand as the organization, and on the other, under the form of independent local societies, recognized as theosophical by their adherence to the three objects of the society. Since the foundation of the Theosophical Society in 1875 over 1400 branches have been chartered in different countries. In 1906 the total membership in all countries was approximately 30,000. The parent society is international, with headquarters at Adyar, Madras, India. In 1916 Mrs. Annie Besant was president.

THEOS'OPHY (Gk. *θεοσοφία*, *theosophia*, wisdom in divine things, knowledge concerning God, from *θεός*, *theos*, god + *σοφός*, *sophos*, wise). A name used for any system of philosophy which starts from a supposed knowledge of God, and proceeds to state laws of the universe on the basis of revelation or of direct knowledge. Usually the claim of a supernatural revelation is made, though this is not essential, and usually, also, theosophy is mystical, holding that systems of truth are revealed through states of mystic feeling. The term has been applied to cults of varying tenets and diverse uses of the concepts of divinity at different periods. Ancient systems of belief falling under this head may be divided roughly into Oriental and Occidental, the former being the older. The earliest traces of theosophic thought are found in the Sanskrit Upanishads (q.v.), which represent mystic meditation on the nature of the All-Soul or Atman. It is in a sense true that all subsequent Hindu philosophy is theosophic. From India this mystical speculation spread to Persia, and from the Persians it was absorbed by the Arabs after their conquest of Iran. In a somewhat similar sense the *Yi-King* and the *Tao-teh-King* of China may be regarded as theosophic.

Among the Jews a theosophy attained wide currency in Europe between the twelfth and sixteenth centuries. The teachings of the Cabbala (q.v.) as represented in the writings of Simeon ben Jochai and Moses de León, however, are so widely different from the theosophy of India as to preclude any idea of Hindu influence. On the other hand, the cabalistic doctrines were profoundly modified by what may be regarded as the typical Occidental theosophy—Neoplatonism (q.v.), represented by Ammonius Saccas, Plotinus, Porphyrius, and Proclus—and by the Gnostics, represented by Valentinus and Basilides. In the Middle Ages theosophy was taught

by Tauler, Eckhardt, Paracelsus, Van Helmont, Robert Fludd, Thomas Vaughan, Heinrich Kunrath, Jakob Boehme, Johann Georg Gichtel, and later by Count Saint-Martin and Schelling. At different periods in history men appeared, claiming to teach the immortality of the soul, and the existence of a vast cosmos, moved by occult forces, of which cosmos this earth is but an infinitesimal part. They claimed to show the instability of material existence, the reality of an occult world reaching everywhere into ours.

In modern times the name "theosophy" has been given to a form of belief promulgated by a Russian, Madame Blavatsky (q.v.), who gave out doctrines concerning cosmogony and anthropology, which, she said, were obtained from certain Masters who had reached a higher plane of existence than ordinary mortals. The system of thought and the terms used are largely drawn from Hinduism and Buddhism. Adept, Master, Mahatma (q.v.) represent different degrees of individual spiritual development in the theosophical system, the Mahatma being the highest. The authoritative work on modern theosophy is Madame Blavatsky's *The Secret Doctrine*, which states "the three fundamental propositions" as follows: (1) An omnipresent, eternal, boundless, and immutable principle on which all speculation is impossible, since it transcends the power of human conception and could only be dwarfed by any human expression or similitude. (2) The eternity of the universe in toto as a boundless plane, periodically the playground of numberless universes incessantly manifesting and disappearing—the law of periodicity. (3) The fundamental identity of all souls with the universal Over-Soul, the latter being itself an aspect of the unknown Root; and the obligatory pilgrimage of every soul—a part of the Over-Soul—through the cycle of incarnation in accordance with cyclic and karmic law, during the whole term. The esoteric philosophy admits of no privileges or special gifts in man save those won by his own Ego through personal effort and merit throughout a long series of reincarnations.

According to theosophic teaching, God is said to be infinite and absolute. Therefore, no attempt is made to qualify or describe the Great Unknown, which is the source of both matter and spirit. These are the two aspects of one root nature. According to immutable law, the spirit involves into matter and matter evolves the spirit. Thus there is a circulation downward and upward, from spirit into matter and from matter to spirit. Evolution is accepted, but only as half a law, whose other half is involution.

All worlds pass through seven great periods of manifestations called rounds. Spiritual at first, they become denser and darker in the downward cycle, the fourth of which is the densest and our present material world. Thence begins its upward movement towards spirituality. The advantage gained is the experience and ultimately the emancipation of the soul. In each of these rounds, periods of incalculable duration, there are seven great root races. Each root race has seven subdivisions or subraces corresponding with the rounds, which become more material from the first to the fourth. We are at present in the fifth subrace of the fifth root race, and on the upward cycle of the fourth round. Evolution is constant progress, an unfolding of consciousness from the most primitive forms of life to the highest intelligence.

All souls are the same in essence, but they differ in degrees of development; each bears a certain relation to the others and to the whole. The more advanced souls are the natural guardians of the less developed. Man is composed of seven principles, which are divided into a lower or mortal, and a higher or immortal nature. The lower nature, constituting his personality, is fourfold. One-fourth, the physical body, is visible, three-fourths invisible. These three are the astral or design body (*linga śarīra*), on which are molded the physical atoms, then the life principle, and the principle of desire. The physical body (*sthūla śarīra*) is material without form. It is held in form by the astral body, and moved to action by the fire of desire (*kāma*). This fourfold nature is common to all animal beings, is mortal and subject to dissolution at death. The higher nature of man is threefold, the mind (*manas*), soul (*buddhi*), and spirit (*ātman*). The mind distinguishes man from the animal. Entering the animal body, the mind thinks of itself as separate from others. The soul is universal, overcoming separateness and showing relationship of soul with soul. The spirit is the one indivisible which passes through all things and unites them with each other. Death is the separation of the principles. The physical body returns to the elements which gave it. The astral body disintegrates more slowly. The life (*prāṇa*, literally "breath") passes at once into the universal life (*jīva*). Desire forms itself into a body (*kāmarūpa*) which gradually becomes exhausted, leaving seeds (*skandhas*), from which the returning soul forms a later and new personality.

The trinity of mind, soul, and spirit, when freed from the trammels of a mortal garment, passes through certain states of consciousness until it reaches the condition called heaven (*dēvacāna*), where it enjoys a period of bliss and rest proportionate to its good thoughts and ideals while on earth. When these exalted ideals have been exhausted, its period of rest is at an end and it descends gradually to earth. The trinity, after enjoying its rest, and realizing those ideals which could not be attained on earth, is attracted again to earth by the unfulfilled longings and desires which remain behind as seeds. These it animates. It sinks into the emotional world, is attracted to a particular family, who can furnish a body and surroundings suited to its new experience, and is reborn into this world. The higher nature must become consciously immortal, i.e., it must acquire a continuity of consciousness, thus making it consciously immortal while in the physical body. One earth life is not sufficient. Hence rebirth into the school of life is the lot of the soul until all the lessons have been learned. This doctrine is closely associated with that of Karma, which is the law of balance, of action and reaction, of effect inevitably connected with the preceding cause. It returns to man measure for measure his good or evil thoughts and deeds. It is inseparable from reincarnation. When at last Karma is exhausted, and no desire, either good or evil, is left to produce a new Karma, then reincarnation will cease.

The phenomenon of life is a question of planes or states of consciousness. Human or "I am I" consciousness (*manas*) is the self-identifying of the consciousness, as being distinct and separate from others by the intelligent principle of mind. At this point a man may rise to the

divine or sink below the consciousness of the brute—at will. Universal or “I am thou and thou art I” consciousness (*buddhi*) is the relating of the elements and of all souls with each other, thus overcoming the sense of separateness of the mind by the principle of the divine soul. Divine consciousness (*ātman*) sees no separateness, but unites all as one.

Hell (*avici*) is a low and depraved condition on this earth. A life of intense selfishness and wickedness with no spiritual thoughts or aspirations causes the immortal soul to abandon the body before death. In such a case, it is not, however, the soul, but the body with the lower principles which is lost. After the death of such a body the desires with a reflection of the mind may be reincarnated in human form almost immediately. Such a creature is entirely material and animal, intensely selfish in its propensities, and doomed to final destruction, unless it makes a strong appeal to its divine soul, in which event the soul might again connect with it and try to help it on its upward path.

In man divine powers are latent, for he is essentially a soul, a divine being. By purification and training of the body, the latent and divine powers will develop and become active. In every period of evolution a number of souls reach perfection. They are men whom the bonds of personality no longer bind to the attractions of the senses. They have consciously related themselves to the source of their being and have become one with the divine. They watch over humanity and are its guardians. Although they have earned their freedom from rebirth, they prefer to remain in contact with men on earth, to teach and to guide them. At certain periods some appear among men as great lawgivers, rulers, teachers; and their agents found religious systems and schools of philosophy.

THEOTOCOPULI, thā-s'tō-kō-pōw'lē, DOMEN-

ICO, known as EL GRECO (the Greek) (c.1547-1614). The foremost Spanish painter of the sixteenth century. He was born at Candia, Crete, and went early to Venice, where, between 1560 and 1570, he studied with Titian, but was most influenced by Tintoretto. Through his compatriot Giulio Clovio, the miniature painter, he secured in 1570 the patronage of Cardinal Alessandro Farnese at Rome, where he practiced his art till c.1576. He then removed to Toledo, having received an important commission from the dean of the cathedral. There is record in 1577 of a lawsuit with the chapter of the cathedral over his painting “L'Expolio,” to which they objected on financial and theological grounds. Another ambitious effort, “The Martyrdom of San Mauritius” (Escorial), painted for Philip II, failed to meet with the approval of that monarch. He was successful enough, however, at Toledo, where the rest of his life was spent. He received important commissions from churches, religious houses, and the nobility. The princes of the Church, civic rulers, and notables of Toledo sat to him for portraits, besides the poets, scholars, and artists whom he reckoned among his friends. He was a man of fine culture, the possessor of a library rich in classic and religious lore, and wrote an important work, *The Art of Painting*, now lost. He lived in state in the 24 best rooms of the large palace of his friend, the Marquis of Vileña, which lay high over the Tajo, with the fine view of Toledo seen in his landscapes (Greco Museum, Toledo, and Havemeyer collection, New York). Part of the palace is now a museum bearing his name. All Toledo mourned his death (April 7, 1614), and he was interred like a noble in the church of Santo Domingo. Five sonnets, written by distinguished poets, extolled his merits.

The early or Italian period of El Greco's work shows the influence of Venetian color, Tintoretto's light and shade, and of Michelangelo in foreshortening and movement. Here belong such works as “Christ Healing the Blind Man” (Dresden and Parma); “Boy Lighting a Coal” (Naples Gallery); the “Adoration of the Shepherds” (Vienna Gallery); and a “St. Jerome” (National Gallery, London).

His early work at Toledo shows a transition from the Italian to his later style, as may be seen in the decorations of Santo Domingo (1577), the central picture of which, “The Ascension,” is now in the Art Institute, Chicago; in “Christ Despoiled of his Garments” (L'Expolio) (1579), still in Toledo Cathedral; and the “San Mauritius” mentioned above. From c.1584 his color becomes colder, with a subtle use of blues, grays, and pale reds, strong contrasts of pure color, increasing emotional intensity, and more dramatic light and shade effects. El Greco became the foremost exponent of Spanish mysticism in painting. The masterpiece of this period, if not of all his works, is the “Burial of Count Orgaz” in San Tomé, a marvel of color and dramatic feeling and fine composition. Others are: “The Baptism of Christ,” “The Resurrection,” “The Crucifixion,” and “The Annunciation,” all in the Prado, Madrid.

His latest style, beginning about 1604, shows increasing emotional intensity with a corresponding neglect of technique, the figures being elongated out of all proportion in an effort to obtain imaginative, visionary effects. To this

period belong "Christ Dead in the Arms of God the Father," "The Ascension of San Vicente" (finished in 1613); the five scenes from the "Life of Mary Magdalen" (church of Titulcia); "The Pentecost" (Prado, Madrid); "Christ's Agony in the Garden" (Lille Museum); and his last work, "The Baptism of Christ," in the Hospital of San Juan, Toledo.

El Greco's highly subjective portraits show a wonderful subtlety of delineation. Among the best-known examples are those of Giulio Clovio (Naples Museum); the "Man with his Hand on his Breast" (Prado, Madrid); the "Grand Inquisitor of Spain" (Havemeyer collection, New York); a "Portrait of a Lady" (Van Horne collection, Montreal); "A Young Greek Woman" (Sir John Stirling Maxwell, London). Of the numerous portraits reputed to be of himself the best and seemingly most authentic belongs to Señor Bernete (Madrid). His art can best be studied at Toledo, in the Museo del Greco, the hospital, the cathedral, and other churches. In the Prado, Madrid, are 24 examples, in the Escorial six. He is next best represented in the United States. In New York the Hispanic Society possesses six, including several excellent examples; the Frick collection three; the Havemeyer three; and many are owned by dealers, two of whom held exhibitions of his works in March, 1916. In Philadelphia there are three examples in the Johnson and two in the Widener collections. He is also represented in the public collections of New York, Boston, and Chicago, and in those of Great Britain, France, and Germany, and particularly in the Royal Gallery at Bucharest, Rumania.

El Greco was also an architect, and designed the great altars containing his most ambitious pictures, and the wooden statues decorating them. The most important surviving example is a portion of the lost altar of the "Expolio," in the seminary of Toledo. His son, JORGE MANUEL (1578-1631), assisted his father, and later succeeded him as architect to the cathedral. El Greco's principal pupil was Tristan, and he certainly exercised an influence on the young Velázquez. At the present time El Greco is one of the most popular of all the old masters, his works commanding the highest prices. More than any other old master he influenced the Post-Impressionists (see POST-IMPRESSIONISM), who claimed him as a forerunner.

Bibliography. The best monograph on El Greco, historically and critically, is by Cossio (2 vols., Madrid, 1908), upon which the English work by Calvert and Galliehan (New York, 1909) is based. Consult also: *Masters in Art*, vol. ix (Boston, 1908); August Mayer, *El Greco: eine Einführung in das Leben und Wirken des Domenico Theotocopuli* (Munich, 1911); Maurice Barrès, *El Greco* (Paris, 1911); id., *El Greco, ou le secret de Tolède* (ib., 1912); Hugo Kehrer, *Die Kunst des Greco* (Munich, 1914).

THERA. The ancient name of Santorin (q.v.), one of the Cyclades. The chief town is Thera.

THERAMENES, thê-rām'ê-nêz (Lat., from Gk. Θερραμένης) (?-404 B.C.). An Athenian politician. In 411 B.C. he was a leading member of the oligarchy of the Four Hundred at Athens, but soon, going over to the opposition, took a leading part in the deposition of that body. In 410 he took part in the battle of Cyzicus, and in 408 was present at the siege of Chalcedon and the capture of Byzantium. At the battle of

Arginusæ, 406, he was one of the subordinate officers in the Athenian fleet, and after the battle was ordered to return to the spot where the action had taken place and rescue such of the disabled ships and their crews as he could. A severe storm having intervened, he found it all but impossible to execute this order, and as a result a large number of Athenian citizens were drowned. Then, anticipating the wrath of the people, he hastened to Athens and accused the commanders in chief of negligence. When, in 404 B.C., Athens was besieged by the Lacedæmonians, Theramenes was sent to Lysander to arrange a peace, but, after remaining in Lysander's quarters more than three months, until the Athenians were reduced to such a state of suffering that they were ready to submit to any terms, he returned to report that he could accomplish nothing, but that an embassy must be sent to the Spartan ephors. Being a second time sent forth, this time to Sparta, he concluded a peace unfavorable to the Athenians. He was chosen one of the Thirty Tyrants (q.v.) who were set up at Athens, but, taking sides against the more violent members of that body, he was accused by Critias of being a traitor and was put to death. Consult Pöhlig, *Der Athener Theramenes* (Leipzig, 1877), and B. Perrin, "The Rehabilitation of Theramenes," in *The American Historical Review*, vol. ix (New York, 1904).

THERAPEUTÆ (Neo-Lat. nom. pl., from Gk. θεραπευτής, *therapeutes*, attendant, servant, from θεραπεύειν, *therapeuein*, to attend, from θέρπειν, *therapōn*, attendant). The name of an ascetic sect described by Philo Judæus in his treatise *On the Contemplative Life*. There were groups of this sect in the various nomes of Egypt, and elsewhere, but Philo especially depicts the life of some of these "servants of God and physicians of the soul" who were settled in μοναστήρια, *monastēria*, on the shores of Lake Mareotis south of Alexandria. In their cells, to which no food or drink was brought, they devoted themselves to solitary contemplation and allegorical interpretation of the Scriptures. They had common meals in the evening, a religious service on the Sabbath, and a great festive meal on the 50th day. Eusebius thought that Philo described Christian monks, and this view was still held by Montfaucon. Grätz, Lucius, Hilgenfeld, Schürer, and others have regarded the work as spurious and as an early description of Christian monasticism. Recently, however, the preponderance of scholarly opinion is in favor of Philonic authorship and the real existence of the Jewish sect of the Therapeutæ. The arguments have been presented with great force by Massebieau, Conybeare, and Wendland. Even Bréhier, who feels that the question cannot be decided absolutely, concludes that "one can, without contradiction, ascribe to Philo a eulogy of the Therapeutæ." Consult the French translation by Montfaucon, *Le livre de Philon de la vie contemplative* (Paris, 1709); and the English translations by Yonge, *The Works of Philo Judæus* (London, 1854-55), and by F. C. Conybeare, in *The Jewish Quarterly Review*, vol. vii (ib., 1895); also H. Grätz, *Geschichte der Juden* (2d ed., Leipzig, 1863); A. Lucius, *Die Therapeuten und ihre Stellung in der Geschichte der Askese* (Strassburg, 1880); A. Hilgenfeld, in *Zeitschrift für wissenschaftliche Theologie* (Jena, 1880); A. Massebieau, "Le traité de la vie contemplative et la question des Therapeutes," in *Revue de l'histoire des religions*, vol.

xvi (Paris, 1887); F. C. Conybeare, *Philo About the Contemplative Life* (Oxford, 1895); Paul Wendland, "Die Therapeuten und die philonische Schrift vom beschaulichen Leben," in *Jahrbücher für classische Philologie* (Leipzig, 1896); Emil Schürer, *Geschichte des jüdischen Volkes im Zeitalter Jesu Christi*, vol. iii (4th ed., Leipzig, 1909; Eng. trans. of 1st ed., New York, 1896); E. Bréhier, *Les idées philosophiques et religieuses de Philon d'Alexandrie* (Paris, 1908).

THERAPEUTICS (from Gk. θεραπευτικός, *therapeutikos*, relating to medical treatment, from *therapeuōs*, *therapeutēs*, attendant, servant). The branch of medicine which has as its object the cure of disease. The conception of disease which is found among primitive races is associated with the idea of demon possession. The earliest therapeutic measures were devoted to driving out these demons from the bodies of their victims. Two methods were employed: one consisted in the recital of charms or magic over the ailing part, or over the sick person; and the other consisted in internal administration or external application of certain aromatic or bitter herbs. In the early history of both Eastern and Western nations there was a blending of the office of priest and physician. Among the ancient Egyptians the treatment of disease had acquired a character by no means unscientific. They used remedies of vegetable, mineral, and animal nature, many of acknowledged value. Careful directions as to administration of drugs and indications for their use have been found. Egyptian physicians' knowledge of hydrotherapy, dietetics, and hygiene was far advanced. Among the Hebrews the infliction and cure of diseases is on various occasions in Scripture ascribed to the direct interposition of God. Their methods of treatment consisted principally of strict hygienic means, attention to diet, ablution, separation, and combustion of infected garments. A large list of remedies is mentioned in the Bible. The Babylonians had no practitioners of medicine; they exposed their sick in public places in order that travelers might help as to the best mode of cure. In Assyria the sick were similarly exposed, and purges, emetics, and blisters were employed for three days successively each month. We know that they used salt and alum, as well as fumigations with mixtures of various drugs. The Chinese assert that with them the study of medicine was coeval with the foundation of their empire. They possess works on treatment of great antiquity. Ginseng they regarded as a panacea, and also employed opium, mercury, and many other drugs of value. The Greeks may have borrowed something from the Eastern nations of their knowledge of medicine and treatment; but researches have shown that under the scientific spirit of Hippocrates they had evolved a fairly good system. Hippocrates ascribed disease to alterations of the humors of the body (the blood, phlegm, and yellow and black bile). He employed baths, diet, exercise, blood-letting, the actual cautery, and an extensive series of medicines. The Alexandrian school, which succeeded the Hippocratean, opposed bleeding and returned to simple remedies. This sect was followed by the Empiricists, who followed experience as their sole guide. Then came the Methodic school, which explained all normal and abnormal processes by the contraction and relaxation of the pores of the body. They regarded all medicines as possessing astringent or relaxant qualities, and chose remedies

for one of these effects. Galen represented the highest development of Greek medicine. He explained the operation of drugs by reference to their elementary qualities, heat, cold, dryness, and moisture. In the early periods of Roman history medicine was practiced by the slaves and freedmen and its highest development was reached under the influence of the Greek school. In the Dark Ages medicine was practiced by the monks. Magic and astrology were potent influences. During this time the doctrine of "signatures" arose. According to this idea a remedy was chosen on account of its fancied resemblance in form or color to the organ affected. To this doctrine we trace the introduction into medicine of such drugs as the blood-root and liverwort. The old Galenists used only organic drugs, but in the fifteenth century under Paracelsus and his followers there was an overthrow of the older methods. He first introduced chemical agents (employing mercury in syphilis) and substituted tinctures, essences, and extracts for various disgusting preparations. Towards the middle of the eighteenth century the practice of therapeutics had reached a most complicated stage. There were theories and counter-theories and physicians were prescribing huge doses of unpleasant mixtures in the hope of securing good from all the remedies recommended. A natural reaction set in which resulted in the establishment of homeopathy, an outgrowth of the reactionary doctrine of vitalism. Later there arose the therapeutic nihilists, prominent among whom were Van Swieten and Skoda. This school rejected drug treatment.

Modern therapeutics may be said to have begun with the discovery of morphine, an alkaloid of opium, in 1817. The present method of treatment is embodied in rational therapeutics, which implies the use of remedies based on a knowledge of the diseased condition present in the patient, a knowledge of the nature of disease itself, and of the physiological action of the agent employed, as determined by experimental investigation on animals, from which may be deduced the action on men. The knowledge of the action of drugs must include the manner in which they affect nerve centres, respiration, circulation, and especially their influence on blood pressure and on body temperature. The range of medicinal doses, as well as the minimum and maximum fatal doses, must also be determined. In treating disease it is the aim of the physician to seek the cause of the condition present and to endeavor from a true appreciation of the knowledge of drug action to administer curative remedies. A remedy which will usually cure a certain disease is called a specific. Such is the action of mercury and salvarsan in syphilis, and quinine in malaria. Empirical therapeutics was based on the cumulative evidence that certain drugs were of service in certain conditions, and experiment was the sure guide. Symptomatic treatment aims to relieve the symptoms of disease irrespective of their cause. Rational or scientific therapeutics recognizes that both these previous methods may have to be followed at times, but it aims especially at the removal of the cause of disease by appropriate treatment of whatever sort. It has been developed by the increased knowledge of disease which we have acquired through the growth of the sciences of pathology and bacteriology. *Materia medica* comprises a knowledge of the remedies employed in medi-

cine; while the methods by which drugs are prepared and combined for administration, as well as the separation of the active principles of drugs, belongs to the department of therapeutics known as pharmacy. It is essential that there should be a uniform standard of strength and purity of medicinal products, as well as uniformity in their preparation, and to attain this object the various countries have standards established by law or by professional authority, to which the drugs prepared by the pharmacists must conform. These standards are published by each nation in works known as *Pharmacopœias*. The first United States *Pharmacopœia* was published in 1820, previous to which time European works were mainly used as authorities. This work is revised every 10 years by a committee of physicians and pharmacists. Those preparations which follow its direction and are named in the work are called official. Unofficial preparations, including many newer drugs, are in use. The best of these are finally included in the *Pharmacopœia* (q.v.), provided they are regarded of sufficient value.

The term "therapeutics" is usually restricted to the administration of medicinal drugs, but in its broadest sense, general therapeutics, it includes every form of treatment. Natural therapeutics is the healing power of nature to cure disease through the operation of the so-called *vis medicatrix naturæ*. In what is known as expectant treatment the physician depends solely on this force and sustains the patient's strength by food and nursing. Treatment by surgical means is regarded as a special and separate department of medicine. A large number of other means than treatment by drugs are in use and each is designated by an appropriate prefix. Electrotherapeutics, the use of electricity as a healing agent, is especially valuable in certain cases of disease of the nervous system or local injury to a nerve. By this means nutrition of paralyzed muscles may be maintained by electrical stimulation until the nerve is in a condition to resume its function. Radiotherapy or X-ray therapy is the use of the Röntgen rays for the purpose of treatment. Hydrotherapy is treatment by the application of water, either as baths of various temperatures (balneotherapeutics) or by drinking, douching, spraying, etc. Suggestive therapeutics, a branch of mental therapeutics, is the name given to treatment in the form of suggestion made to the patient while in an induced hypnotic state, with the object of the patient's following the suggestion when out of the hypnotic state. This treatment is of limited utility in a few varieties of nervous disease of so-called functional origin, in which no organic disease exists. Climatotherapeutics is the utilization of certain locations on account of their peculiar adaptability to the patient's condition; as the sending of patients suffering with consumption to great altitudes and dry climates. Thermotherapeutics is the treatment of disease by the application of heat. Therapeutics fully recognizes the value of diet in disease in an important department of the subject known as dietetics or dietotherapeutics. The use of extracts of various glands of the body, especially of the thyroid and the suprarenal glands, has attracted considerable attention. This department of therapeutics is called opotherapy or organotherapy. Massage and various allied measures have a prominent place in the treatment of certain conditions and

assist in sustaining the nutrition of the muscles. This is sometimes called mechanical therapeutics or mechanotherapy (q.v.). See also the separate articles under the different forms of therapeutics enumerated here.

There have been a number of methods of classifying remedies followed by various authorities, but none of these is entirely satisfactory. The most important are: (1) the botanical method, which groups the vegetable remedies according to the botanical classifications; and (2) the arrangement according to the therapeutic action of drugs. Many drugs, however, are used for a number of purposes, and it is undesirable to describe them under more than one heading. Finally, there is (3) the pharmacological classification, which arranges drugs according to their action on living matter. This method does not take into account the chemical composition or therapeutic action of drugs, but those having the most characteristics in common are placed together. The groups are named for the most prominent member or from some marked property possessed by all. Consult: H. A. Hare, *Modern Treatment* (2 vols., Philadelphia, 1910-11); Frederick Forchheimer, *Therapeutics of Internal Diseases*, edited by Billings and Irons (2d ed., 5 vols., New York, 1914); H. A. Hare, *Textbook of Practical Therapeutics* (15th ed., Philadelphia, 1914); A. R. Cushny, *Textbook of Pharmacology and Therapeutics* (6th ed., ib., 1915). See PSYCHOTHERAPY.

THERESA, SAINT. See TERESA.

THERESINA, tã'rê-zê'nã, or **THEREZINA**. The capital town of the State of Piauh, Brazil, on the right bank of the river Parnahyba, 220 miles from the city of that name at its mouth (Map: Brazil, J 5). The town is a commercial centre of some importance. Pop. (est.), 30,000.

THERESIOPEL, tã-rã/zê-ô'p'l, or **MARIA-THERESIOPEL** (Hung., *Szabadka*). A royal free city of the county of Bács, Hungary, 109 miles by rail south-southeast of Budapest (Map: Hungary, F 3). It is a scattered town, lying in a great, rich plain between the Danube and the Theiss, and has noteworthy churches. Theresiopel is the centre of a fine large corn-raising district, which also produces tobacco. The manufactures include linens and shoes. The town has a fine trade in grain, wine, horses, cattle, hogs, hides, and wool. Pop., 1900, 82,122; 1910, 94,610.

THERIA. See EUTHERIA.

THERIDIIDÆ (Neo-Lat. nom. pl., from Gk. *thēridion*, *theridion*, dimin. of *thēr*, wild beast). A family of spiders known as the cobweb weavers. These are small spiders with very slim legs, and include most of the familiar house spiders. They are generally soft and of a light color, with the abdomen large and round and the legs lacking in spines. The eyes are all of about the same size and are placed in two rows across the front of the head. The mandibles are weak and without teeth at the end. The maxillæ are pointed at the end and turn inward toward each other. The family is one of the largest of the order Arachnida. Many species of Theridiidæ spin their webs in the fields on bushes. The web is a flat or curved sheet, supported by threads which run in many directions, under which the spider hangs head downward. The egg cocoons are round and soft and hang in the web.

THERIODONTA (Neo-Lat. nom. pl., from Gk. *thēridion*, *therion*, dimin. of *thēr*, wild

beast + *ὄδους*, *odous*, tooth). An order proposed by Owen to include the mammal-like reptiles with mammal-like teeth, from the South African Karroo formation. The group has since been subdivided, the Lower Permian types forming the Therocephalia, the Upper Triassic forms being placed in the order Cynodontia.

THERIOSUCHUS (Neo-Lat., from Gk. *θηρίον*, *thērion*, dimin. of *θήρ*, *thēr*, wild beast + *σούχος*, *souchos*, crocodile). An extinct crocodile with body less than two feet long, skeletons of which are found in the Purbeck beds of the English Upper Jurassic. See CROCODILE; TELEOSAURUS.

THERMÆ, *thēr'mē*. The Latin term, used also in English, for a Roman bathing establishment. While the earlier *thermæ* were comparatively modest in size, those built by Agrippa (27 B.C.) and by the emperors Titus, Trajan, Caracalla, Diocletian, and Constantine, were of immense size and complexity. They were all of one general type, comprising a central block flanked by courts, set upon an immense terrace built on vaulted supports. Besides the *frigidarium* or cold plunge, the vast vaulted *tepidarium* or warm bath, the *caldarium* and *sudatorium*, hot vapor chambers, the courts with dressing rooms and long rows of smaller bath chambers, they provided also gardens, stadia, halls for clubs and lectures, and many other features for exercise and recreation. The largest was that of Caracalla, accommodating 3600 bathers at once; its ruins are the most imposing in Rome with the possible exception of the Colosseum. The baths of the Forum and the Stabian *thermæ* at Pompeii are well preserved and very interesting, though of small size. The *tepidarium* of the *thermæ* of Diocletian at Rome is now the church of Sta. Maria degli Angeli. See BATH; ROMAN ART.

THERMÆ ANTONINIANÆ. See BATH.

THERMÆ HERCULIS. See MEHÁDIA.

THERMÆ HIMERÆÆ, or **HIMERENSES**. See HIMERA.

THERMÆ TITIANÆ. See TITUS, BATHS OF.

THERMÆ TRAJANÆ. See TRAJAN, BATHS OF.

THERMAL SPRING (from Gk. *θερμή*, *thermē*, heat, from *θερμός*, *thermos*, hot). A spring whose temperature is higher than the average temperature of the locality in which it emerges. The temperature may vary therefore from a minimum of a few degrees above the freezing point, which, however, is limited to thermal springs in high altitudes or great elevations, to a maximum represented by the boiling point of water under the local conditions. When the temperature reaches the latter limit the flow of the spring may take the form of periodical eruptions; a thermal spring of this character being known as a geyser (q.v.). The higher temperature of thermal springs as compared with ordinary springs may be caused by volcanic agencies or by the circulation of the waters at great depths in the earth's crust previous to emergence. The hottest springs are usually found in volcanic regions, their high temperature due to coming in contact with uncooled lava, which, buried at some depth, long retains its heat. It seems probable, also, that some springs are heated by gaseous emanations from the earth's interior, or, indeed, receive material contributions from that source. Thermal springs are common in districts that have been free

from volcanic disturbances, at least since remote geological times. Such increase in temperature can best be explained by peculiarities of geological structure which permit the surface waters to descend to great depths when heated and thence return to the surface under the influence of hydrostatic pressure. See SPRING.

THERMES, *tärm* (Fr., from Lat. *thermæ*, warm baths). The only remains of the Roman palace which occupied the site of the present Hôtel de Cluny, Paris. The ruins are those of the great baths connected with the palace, and include a *frigidarium* 65 feet long and 59 feet high, still uninjured, although up to 1820 it had long borne the weight of a garden laid out over it. The ships' prows of the vaulting are said to be the origin of the arms of Paris. A collection of Roman antiquities discovered in Paris is preserved in the hall.

THERMIC (*thēr'mik*) **FEVER**. See HEAT STROKE.

THERMIDOR, *Fr. pron. tär'mé'dör'* (Fr., from Gk. *θερμή*, *thermē*, heat + *δῶρον*, *dōron*, gift). The eleventh month in the French revolutionary calendar. It extended from July 19 to August 18 in the years I-VII and from July 20 to August 19 in the years VIII-XIII. The 9th Thermidor of the year II (July 27, 1794) is historically memorable as the date of Robespierre's fall and the termination of the Reign of Terror. The name "Thermidorians" was given to all those who took part in this coup d'état, but more particularly to those who were desirous of restoring the monarchy. See FRENCH REVOLUTION; ROBESPIERRE.

THERMIT, *thēr'mit*. See ALUMINO-THERMICS; WELDING.

THERMOBAROMETER. See HYPSONETER.

THERMOCHEMISTRY. The branch of general chemistry that deals with the thermal phenomena accompanying chemical transformations. Since the phenomena in question are caused partly by the chemical changes proper, but partly also by the purely physical changes of state that often accompany chemical reactions, the scope of thermochemistry must extend over physical as well as chemical changes of matter. For the principles of thermochemical notation, see CHEMISTRY, *Transformations*.

What has thus far been accomplished in the domain of thermochemistry may be summed up as follows: First, a large number of transformations have been subjected to calorimetric measurement, and so the total amounts of heat given off or absorbed during a great many changes have been determined experimentally; secondly, the principles of thermodynamics have been successfully applied to the consideration of chemical changes, and thus thermochemistry has been highly developed theoretically.

Experimental Thermochemistry. The actual execution of thermochemical measurements is a matter of some difficulty, owing to the considerable errors that may be caused by more or less heat being lost by radiation while the measurement is being carried out. The heat given off or absorbed is determined by keeping the vessel in which the reaction takes place immersed in a known quantity of water, and observing the temperature of the latter before and after the reaction. In recent years Richards and other experimenters have sought altogether to eliminate loss of heat through radiation, by keeping the vessel surrounding the

calorimeter at the same temperature as the calorimeter itself (adiabatic calorimetry). But whatever the details of the calorimetric arrangement many reactions would remain inaccessible to thermochemical investigation if it were not for the fact that early in the history of thermochemistry a principle became known that permitted of ascertaining the heat reactions by indirect methods. The principle in question is known as the law of constant heat sums. While clearly established by Hess in 1844, i.e., before the law of the conservation of energy became known, it is nothing but a special form of the law of conservation. It is as follows: The amount of heat given off or taken up when a given chemical system is changed into another is the same whatever the steps in which the change may take place. Let, e.g., the given chemical system consist of 17 grams of gaseous ammonia in one vessel, its equivalent 36.5 grams of gaseous hydrochloric acid in another vessel, and a large quantity of water. This system may be changed into a dilute aqueous solution of ammonium chloride in two different ways: (1) ammonia and hydrochloric acid may be caused to combine in the gaseous state, yielding solid ammonium chloride and developing 42,100 calories of heat; then the ammonium chloride may be dissolved in the water—a change accompanied by the absorption of 3900 calories; or (2) the gaseous ammonia may be dissolved in a large amount of water—a process developing 8400 calories; the gaseous hydrochloric acid may be dissolved in a separate large quantity of water—a process developing 17,300 calories; and finally, the dilute aqueous ammonia may be mixed with the dilute aqueous hydrochloric acid—a process developing 12,300 calories. Whichever the way adopted, the result is the same—viz. a dilute aqueous solution of ammonium chloride. The heat developed when the first way is adopted is $42,100 - 3900 = 38,200$ calories; the heat developed when the second way is adopted is $8400 + 17,300 + 12,300 = 38,000$ calories. The figures 38,200 and 38,000, differing by only 2 parts in 382 (little more than $\frac{1}{2}$ per cent), i.e. by less than the unavoidable experimental error, must be considered as equal—which is in accordance with the law of constant heat sums. If, for some reason, it were impossible directly to measure, say, the heat produced by the combination of gaseous ammonia and gaseous hydrochloric acid, that heat might be calculated, according to the law of constant heat sums, by adding 3900 calories (the heat absorbed when one equivalent of ammonium chloride is dissolved in much water) and 38,000 calories (the total heat produced during the transformation, by the second way, of gaseous ammonia and hydrochloric acid into dilute ammonium chloride). The sum, 41,900 calories, would be as near the truth as the 42,100 calories found by direct experiment.

To take another, even simpler example, suppose it were asked, How much heat would be evolved or absorbed in the transformation of 12 grams of amorphous carbon into diamond? The transformation, although accomplished on a minute scale by Moissan, in his electric furnace, is of course inaccessible to direct calorimetric measurement. But the law of constant heat sums permits of answering the question by measuring the heat of combustion of amorphous carbon and that of diamond. The transforma-

tion of amorphous carbon into carbon dioxide, whether accomplished by direct combustion or by first changing the carbon to diamond and then burning the latter, must be accompanied by the evolution of the same amount of heat, viz. 97,650 calories; and as the heat of combustion of diamond is 94,310 calories, the transformation of amorphous carbon (12 grams) into diamond must, according to the law of constant heat sums, be accompanied by the evolution of $97,650 - 94,310 = 3340$ calories.

In a similar manner Hess's law permits of ascertaining the heat that would be developed during the formation of compounds (e.g. the majority of organic compounds) whose formation from the elements could not be directly studied calorimetrically. Let it be required, i.e., to ascertain the heat that would be developed or absorbed if ordinary alcohol (C_2H_5O) were made from its elements—carbon (in the form of diamond), hydrogen, and oxygen. To do this, we may determine calorimetrically the heat (call it a) developed by the combustion of one gram molecule of alcohol and the heats of combustion (b and c) of quantities of isolated carbon (diamond) and hydrogen equal to those contained in one gram molecule of alcohol. The three combustions may be represented by the following equations:

Adding the second and third equations, we get:

and subtracting the first equation from this, we get:

This last equation, expressed in words, means that if carbon, hydrogen, and oxygen combined to form ordinary alcohol, an amount of heat would be formed equal to the heat of combustion of the isolated elements of alcohol minus the heat of combustion of alcohol itself; b , the heat of combustion of two atoms (i.e., twice 12 grams) of carbon is found to be $94,300 \times 2 = 188,600$ calories; c , the heat of combustion of three molecules (i.e., 3×2 grams) of hydrogen is found to be $67,500 \times 3 = 202,500$ calories; finally, a , the heat of combustion of one molecule (46 grams) of alcohol, is found to be 340,000 calories. Hence, $b + c - a$, the heat of formation of alcohol, is $188,600 + 202,500 - 340,000 = 51,100$ calories. See COMBUSTION.

Theoretical Thermochemistry. This, as already stated above, consists in the application of the principles of thermodynamics to chemical phenomena. The subject, though not very difficult, requires a working knowledge of higher mathematics and thermodynamics, and can therefore be discussed here only in its more elementary aspects. The principal questions to which thermodynamics has been applied concern: (1) the influence of temperature upon the total energy change of reactions, i.e., heat given off or absorbed, no mechanical work being performed; (2) the influence of temperature upon the velocity of reactions (see REACTION, CHEMICAL); (3) the influence of temperature on chemical equilibrium; (4) the determination of the maximum mechanical work that can be performed by the chemical energy of reactions. We will briefly consider these questions in order.

With reference to the dependence of the energy change of a reaction upon the temperature, the verdict of thermodynamics is, first of all, that in case the heat capacity of the reacting substances is the same as that of the products of the reaction, the energy change of the reaction does not vary with the temperature. This is generally the case when the reacting substances and the products of the reaction are all solids. Thus the combination of silver and solid iodine into silver iodide sets free practically the same amount of heat (about 14,000 calories), no matter at what temperature the combination is caused to take place. On the other hand, if a given reaction does cause a change in the heat capacity, then, if t denotes the difference between two temperatures at which the reaction may take place, $u_1 - u_2$ the difference between the energy change at the first and that at the second temperature, and c the difference between the heat capacity of the reacting substances and that of the products of the reaction,

$$u_1 - u_2 = ct.$$

By measuring calorimetrically the heat capacities in question and the energy change of the reaction at some one temperature, it is therefore easy to calculate the energy change of the reaction at any other temperature—a result of considerable importance, because direct calorimetric measurement of the energy change can by no means be readily carried out at any desirable temperature.

As to the velocity of reactions (see REACTION, CHEMICAL), it is well known that rise of temperature causes the velocity of reactions to increase with great rapidity. Usually a rise of 10° C. doubles or even trebles the velocity. In a perfectly general manner, however, the dependence of the velocity on temperature cannot as yet be formulated. Van't Hoff has succeeded in showing that in many cases the dependence of reaction velocity on the temperature can be expressed by simple equations of the following form:

$$\log k = -\frac{A}{T} + B,$$

an equation established by him by combining the principles of thermodynamics with experimental observations. In this equation k stands for the velocity at the instant when the product of the active masses equals unit; T stands for the absolute temperature (i.e., the centigrade temperature plus 273 degrees); and A and B are constants whose numerical values depend on the nature of the substances taking part in the reaction. If k is actually measured at only two different temperatures, and its two corresponding values (say k_1 and k_2), together with the two temperature numbers (say T_1 and T_2), are substituted in the above equation, we get:

$$\log k_1 = -\frac{A}{T_1} + B,$$

$$\log k_2 = -\frac{A}{T_2} + B,$$

two equations with two unknowns, A and B . Solving these equations, and substituting the resulting numerical values of A and B in the general equation given above, we obtain a general relation between k and T for the given reaction. In other words, we can readily calculate what may be termed the standard velocity for any temperature whatever—the standard velocity being the velocity at the instant the concen-

trations of the reacting substances are such that the product of their active masses equals unit. The law of chemical mass action then permits of calculating the reaction velocity for all other possible concentrations.

With reference to chemical equilibrium (see REACTION, CHEMICAL), thermodynamics, as Van't Hoff has shown, permits of foreseeing the equilibrium of a reaction at some temperature T_2 , if the equilibrium at some given temperature T_1 and the average of the energy changes (heats given off or taken up by the reaction) at the two temperatures are known. In this manner it is possible to calculate, i.e., the degree of dissociation of ammonium chloride (see DECOMPOSITION; DISSOCIATION) at different temperatures, if the degree of dissociation at some one temperature, and the heat of dissociation, are known. In connection with the influence of changes of temperature on chemical equilibrium, it is necessary to mention also Gibbs's *Phase Rule*, which is of great importance in classifying the phenomena of equilibrium in material systems. See PHASE RULE.

One more important application of thermodynamics to chemical phenomena has been made and requires mention. Thermodynamics, in studying a transformation of some material system, endeavors to ascertain the maximum mechanical work that might be produced by the transformation, the maximum work meaning the work that might be obtained by the use of some ideal mechanical device, frictionless and permitting, so to speak, of no leakage of energy. The importance of knowing this maximum of work is great. Any natural change taking place of itself—whether it be the falling of a stone, expansion of a compressed gas, combustion of coal, or any other change, mechanical or chemical—may be used to produce mechanical work; and no material system is capable of changing unless it possesses the capacity for producing work—or, as Helmholtz terms it, free energy. In other words, it may be said that it is because a system can produce mechanical work that it is capable of changing spontaneously. The burning of coal (i.e., the chemical transformation of the system, carbon and oxygen), once started, can go on of itself because it can be used to produce mechanical work, or, what is the same, because the system carbon and oxygen possesses a certain amount of free energy. When, therefore, the free energy of a system has been used, without loss, to produce mechanical work, and that work has been measured, we have a measure of the cause of the given transformation. The cause of chemical transformations is generally termed chemical affinity. Obviously, then, the maximum work that can be produced by a chemical transformation is a measure of the chemical affinities involved in it, and this is why the determination of maximum work has great importance for chemical theory. But it may also be valuable for purely practical purposes. Take, e.g., again the combustion of coal. It is well known that steam engines are very wasteful of energy. In connection with the problem of a more economic use of coal the question must naturally arise, How much mechanical work could possibly be obtained altogether by burning a certain amount of coal, supposing that an ideally perfect device were employed for the purpose? The direct measurement of the maximum work, although theoretically possible, could not be actually carried out.

But the maximum work of a reaction can be readily calculated, with the aid of thermodynamics, if the concentrations of the reacting substances and their products, when in the state of chemical equilibrium, are known. In the case of the combustion of coal the equilibrium concentrations have been determined by indirect measurement, and on the basis of this Nernst has calculated approximately the maximum work of the combustion for three different temperatures: If 12 grams of carbon were burned at the absolute zero of temperature (-273°C.), the equivalent of 97,650 calories might be obtained; at 18°C. the maximum work would be equivalent to 91,470 calories; at 1000°C. the equivalent of only 70,625 calories can be obtained; this in spite of the fact that the heat given off by the combustion is practically the same at all temperatures, viz., 97,650 calories. Only at the absolute zero of temperature could the heat produced by the combustion of coal be entirely transformed into mechanical work.

In conclusion, a few words must be said with reference to an erroneous principle that has gained somewhat wide acceptance among chemists, viz., Berthelot's principle, according to which it is the heat produced by a reaction, and not the maximum possible mechanical work, that measures the cause of the reaction; and of two reactions that might take place in a given system, the one accompanied by the greatest evolution of heat must necessarily take place. This principle holds good often, but not always, and so cannot be looked upon as a law of nature. The most important argument against it is that, were it unlimited in its application, as Berthelot claims it to be, reversible reactions would be impossible; for one of a pair of reversible reactions not only does not develop heat, but necessarily absorbs heat; and hence, if Berthelot's principle were correct, that reaction could not take place at all, and its opposite reaction would be complete. (See REACTION, CHEMICAL.) An exceedingly promising attempt to explain the facts that led Berthelot to the formulation of his principle has in recent years been made by Nernst (see NERNST'S HEAT THEOREM); but this matter cannot be discussed in the present article.

The principal names connected with experimental thermochemistry are those of Hess, Julius Thomsen, Berthelot, Stohmann, and, perhaps, Richards. The first to apply the principles of thermodynamics to chemical phenomena was Horstmann. The problem was next taken up by Willard Gibbs, of Yale University, whose thorough and original treatment of the subject remained unknown for a number of years. The importance of Van't Hoff's thermochemical work may be readily seen from the present sketch. Finally, Le Chatelier, Planck, Riecke, and Duhem have made noteworthy contributions to the mathematical treatment of the subject.

THERMOCOUPLE, THERMOPILE. See THERMOELECTRICITY.

THERMODYNAMICS (from Gk. *θερμῆ*, *thermē*, heat + *δύναμις*, *dynamis*, power). The application of the principles of mechanics to heat phenomena. It is shown in the article HEAT that all heat effects can be traced for their cause to work having been done against the molecular forces of the body—e.g., friction, compression, etc.—or to the reception of energy by the minute portions of the body—e.g., radiation, conduction, etc. In short, it may be regarded as proved experimentally that heat effects always accompany changes in the intrinsic energy of a body; and the idea that the numerical value of the heat effects depends on the energy added to the minute portions of the body and on that alone is now accepted by every one. If a small amount of energy ΔQ is added to a body, its intrinsic energy is changed (dU) and as a rule a certain amount of external work is done by the expansion of the body ($p dV$, where p is the external pressure on the body and dV is the change in volume). By the conservation of energy, then, if no other work is done, $\Delta Q = dU + p dV$.

This is sometimes called the first principle of thermodynamics. If the external work is of other form than that due to expansion, e.g., if it is electric work, the first principle may be written

$$\Delta Q = dU + \Delta W.$$

In any form of heat engine—e.g., a steam engine—the working substance, water, starts at ordinary temperature; heat energy is added to it by the boiler; it reaches a high temperature, that of the boiler, and a high pressure; it expands, doing work in pushing out the piston; its temperature and its pressure therefore fall; the cylinder is now joined to the condenser, and the steam passes out and is condensed to water, giving up heat energy; the piston is drawn back and the process is repeated. So far as the heat energy and work are concerned, heat energy (Q_1) at a high temperature has been given to the working substance, heat energy (Q_2) at a low temperature is taken away from it, external work (W) is done. By the first principle of thermodynamics $W = Q_1 - Q_2$, since the water at the end of its cycle of changes has the same energy that it had at the beginning, provided its temperature and volume are the same. The efficiency of the process is defined as the ratio $\frac{W}{Q_1}$ or $\frac{Q_1 - Q_2}{Q_1}$. In con-

sidering the efficiencies of various processes, Sadi Carnot in 1824 was led to imagine one which bears his name and which can be discussed theoretically. This process is one which consists of a working substance inclosed in a cylinder with a movable piston passing around a cycle so as to return to its initial condition. There are supposed to be two large reservoirs of a liquid, at different temperatures. The cylinder containing the working substance at a high pressure and small volume is imagined placed in the high-temperature tank; the substance is allowed to expand, so slowly that its temperature remains practically unchanged at that of the surrounding liquid in the tank; in

doing this, heat energy must flow into the working substance, otherwise its temperature would fall; after the volume has increased sufficiently, the cylinder is removed from the tank, and the inclosed substance is allowed to expand under such conditions that no heat energy can enter, and its temperature falls; when it reaches that of the second tank the cylinder is placed in it, the piston is forced in by external force, thus reducing the volume; if this process is done slowly the temperature will not rise, but heat energy will flow out into the liquid of the tank; when the volume is sufficiently reduced, the cylinder is removed and the piston is pushed in under such conditions that no heat energy can leave or enter; if the volume at the beginning of this last step is chosen correctly the working substance will after a sufficient compression be restored to its original condition. There have been four steps, two isothermal and two adiabatic. The net result is: No change in the working substance; external work (W) done by the substance; heat energy Q_1 withdrawn from the high-temperature tank; heat-energy Q_2 given out to the low-temperature tank. Therefore, by the first principle of thermodynamics,

$$W = Q_1 - Q_2.$$

This process of Carnot's is perfectly reversible; by doing an amount of work W on the working substance it may be made to pass around the cycle in the reverse way; the low-temperature bath losing an amount of heat energy Q_2 and the high-temperature bath gaining an amount Q_1 . The conditions for reversibility are that each point of the whole cycle should be one of equilibrium; and it is apparent that for this to be satisfied the changes must all be made slowly, and that when the substance receives or gives out heat energy it must be in contact with a large tank of liquid at the same temperature, within an infinitesimal amount, as it itself is at that instant. (If a gas expands out of a high-pressure reservoir into the open air—e.g., illuminating gas rushing out of a burner—the process is irreversible; if in an engine the flame is at a higher temperature than the steam in the boiler—as it always is—the process is irreversible.) It was stated by Carnot that the efficiency of his process, $\frac{W}{Q_1}$, was

the same for all working substances and depended alone on the temperatures of the two baths. His proof was, however, erroneous, and was corrected by Clausius in 1850, who showed that the statement was correct if one assumed that heat energy of itself always passes from high to low temperature. This is in accord with all our experiences of nature; thus, if a hot and a cold body are left free to radiate or to conduct to each other, the former always becomes colder and the latter warmer. The statement that heat energy of itself does always pass from high to low temperature is called the second principle of thermodynamics. Lord Kelvin has shown that this principle is identical in its conclusions with the assumption that it is impossible by any material agency to derive mechanical effect from any portion of matter by cooling it below the temperature of the coldest of the surrounding objects.

Since $\frac{W}{Q_1}$ is a function of the temperatures of the two tanks alone, it is possible to give

such numbers to the temperatures of these tanks as will be independent of the working substance (i.e., thermometric substance). Lord Kelvin—then William Thomson—suggested that the numbers T_1 and T_2 be so chosen for the temperatures of the tanks that $\frac{T_1}{T_2} = \frac{Q_1}{Q_2}$. In

this case $\frac{T_1 - T_2}{T_1} = \frac{Q_1 - Q_2}{Q_1} = \frac{W}{Q_1}$ and is therefore independent of everything except the temperatures. $T_1 - T_2$ may be given any arbitrary value, e.g., 100; then the number T_1 for the temperature of the hot bath is determined by performing a Carnot's process, using any working substance. All other thermometric systems depend upon the selection of the thermometric substance, and no two systems would in general give the same numbers for the same temperature. Thus the great scientific advantage of Thomson's absolute scale is seen. It is found by direct experiment that if $T_1 - T_2$ is chosen as 100 for two tanks of melting ice and boiling water, the numbers on Thomson's absolute scale are almost exactly the same as obtained in a gas thermometer using the absolute centigrade scale. See THERMOMETRY.

Since the efficiency increases as T_2 becomes smaller, and since the efficiency cannot be greater than unity, there must be a minimum temperature in the universe. This is known as the absolute zero; its value is about -273°C. , as shown by the agreement between the two absolute scales just described.

Carnot stated further that the efficiency of an irreversible process could not be greater than that of a reversible one with the two limiting temperatures of the tanks; and Clausius proved that this is true if the second principle of thermodynamics is true.

It is generally accepted that the efficiency of an irreversible process is less than that of a reversible one between the same two temperatures, but it cannot be regarded as a deduction from the two principles of thermodynamics. All processes in nature—chemical, electrical, etc.—are irreversible; and a natural system will therefore be in equilibrium if all imaginable processes compatible with the existing conditions necessarily involve an efficiency equal to or greater than that which corresponds to a reversible process.

Clausius made an interesting application of Carnot's principle and Thomson's definition of temperature. As defined above $\frac{T_1}{T_2} = \frac{Q_1}{Q_2}$, i.e.,

$\frac{Q_1}{T_1} = \frac{Q_2}{T_2}$; but in passing around a Carnot's cycle the heat added to the working substance is Q_1 and it is added while the body is at temperature T_1 ; no other heat is added; and the heat taken away is Q_2 while the body is at temperature T_2 . If we call heat added positive, we must call heat taken away negative. Now, form the summation of the ratio $\frac{Q}{T}$ for the whole cycle. Along the higher isothermal this is $\frac{Q_1}{T_1}$; along both adiabatics it is zero (since $\Delta Q = 0$); along the lower isothermal it is $-\frac{Q_2}{T_2}$.

Hence the sum is $\frac{Q_1}{T_1} - \frac{Q_2}{T_2}$; and by the above equation this sum is zero. Since it is possible

to break up any cycle of operations into a series of Carnot's cycles, it is evident that the summation of $\frac{Q}{T}$ around any cycle equals zero; or, using the symbols of the calculus, $\oint \frac{\Delta Q}{T}$ around a cycle = 0. The fundamental

property of a cycle of operations is that the working substance returns to its former condition. So this equation signifies that $\frac{\Delta Q}{T} = d\phi$, where ϕ is a property of the body itself (just as are its temperature and its volume). This property was called by Clausius the entropy.

If two bodies at different temperatures are allowed to come to equilibrium, the hotter one will lose heat, thus having its entropy decrease, the colder one will gain heat, thus having its entropy increase. The decrease in entropy of the former is $\frac{\Delta Q}{T_1}$ while ΔQ passes from it to the colder body; and the gain in entropy of the latter owing to this passage is $\frac{\Delta Q}{T_2}$. But

T_1 , the temperature of the hot body, is greater than T_2 , that of the cold body; hence considering the two bodies as a system there has been a gain in entropy. The same is true during any actual changes in nature, such as relative motion, which always involves friction, diffusion, etc. Clausius stated this by saying "the entropy of the universe tends to a maximum."

This fact has been given mathematical expression in a different form. If one introduces into Clausius' equation defining entropy the value of ΔQ as given in the first principle, the equation becomes $dU + p dV = T d\phi$. Apply this to a system of bodies which are in equilibrium with each other and with external conditions, i.e., there must be uniform temperature and uniform pressure within the system and without. Therefore, the above equation becomes $d(U + pV - T\phi) = 0$, where U , V , and ϕ are the values for the entire system. Now, if the system is not in equilibrium, but changes are going on, and if there is a constant temperature and a constant pressure on the outside of the system, it is not difficult to prove that $d(U + p_0V - T_0\phi) < 0$ where p_0 and T_0 are these external values. Thus, there is a function of the system, viz., $U + p_0V - T_0\phi$, such that under constant external conditions, if any internal changes occur, this function decreases. These changes will cease when the function reaches its minimum value. Such a function is called the thermodynamic potential at constant pressure and temperature. The importance of this principle in considering various chemical changes is evident. Gibbs, Planck, Duhem, and others have made brilliant use of it.

This function has another property which has been emphasized by Planck, and which justifies its other name "characteristic function." If the independent variables of the system are p and T , as they are in most experiments, it may be proved that, provided this function is known, all the thermodynamic properties of the system may be deduced from it.

In what has gone before it is seen that there are many properties of the system: its volume (V), its pressure (p), its temperature (T), its intrinsic energy (U), and its entropy (ϕ). Any two of these may be taken as independent

variables; and depending on this selection, there is a definite characteristic function. Thus, if T and V are the variables, this function is $U - T\phi$, which plays an important part in the work of Helmholtz, and which he called the free energy.

It is clear from the definition of entropy given by Clausius, viz., $d\phi = \frac{\Delta Q}{T}$, that the absolute

value of the entropy is not defined, only changes in its value. Therefore direct experiments cannot give the numerical value of the entropy for any body; but it is possible and allowable to assign a definite value to a body under definite conditions and to see whether this selection is justified by indirect experiments. This bold step was taken by Nernst (1906). What his theorem amounts to is to assume that "at absolute zero the entropy of every chemically homogeneous solid or liquid body has the numerical value zero." All the conclusions drawn from this have been found to be in accord with experiment. Two of these conclusions are that as the temperature is lowered continuously, both the specific heat and the coefficient of expansion of all solids approach zero values. Nernst himself has investigated the specific heats of 28 substances at the lowest temperatures available, and has shown that the specific heat approaches zero. Nernst has shown further that there is an important connection between his results on specific heats and Planck's quantum hypothesis as to the nature of radiation (q.v.). Debye (1912) made several modifications in Nernst's theory, and succeeded in deducing from Planck's equation for radiation a formula which gives the correct values for specific heats at low temperatures. One conclusion is that at such temperatures the specific heats of all solids is proportional to the cube of the absolute temperature.

THERMOELECTRICITY. It was observed by Seebeck in 1822 that, if the two junctions of a closed metallic circuit made up of two different wires in series were at different temperatures, there was produced an electric current. As the difference of temperature at the junctions is increased, the current increases. It was shown, however, by Cumming in 1823, that for any temperature of one junction there is one for the other junction such that there is no current; this is known as the temperature of inversion. If in general, then, the temperatures of the junctions are made more and more different, the current increases, then decreases, becomes zero, and is finally reversed. The

average of the temperatures of the junctions when the current is zero is called the neutral temperature, and is a constant for any two bodies.

These thermoelectric currents are due to molecular actions at the junctions and also throughout the conducting wires, owing to their nonuniformity of temperature. Where the two different metals join there are electric forces called the Peltier electromotive forces; while the electric forces through the conductors themselves are called Thomson electromotive forces. The existence of these electromotive forces is proved by forcing a current around a circuit by means of a battery or cell; at the junctions there is rise or fall of temperature, depending upon the direction of the current, showing a force opposing or helping on the current; similarly the conductor itself has its temperature raised or lowered, depending upon the direction of the current—quite apart from the usual heating effect of a current.

The properties of thermoelectric currents are best studied by diagrams. Some one metal is chosen as a standard; lead is generally selected because it has no Thomson effect. A circuit is made part of lead and part of another metal; one junction is kept at 0°C ., and while the temperature of the other is varied continuously, both above and below zero the total electromotive force around the circuit is measured. These values of the E.M.F. for different values of the temperature of the variable junction are plotted in a curve, having E.M.F. for ordinates and temperatures for abscissæ. These curves when drawn for different bodies—all with reference to lead—are found to be approximately parabolas. Another form of diagram is made as follows: The junctions of the two metals, one of which is lead, are kept at temperatures T and $T + \Delta T$, where ΔT is a small quantity; the resulting E.M.F. around the circuit is measured, call it ΔE . The ratio $\frac{\Delta E}{\Delta T}$ is called the

thermoelectric power; it is evidently a function of the temperature T , and when plotted on a diagram having temperatures as abscissæ, the curves are practically straight lines.

A thermocouple is one of the most sensitive instruments known for detecting differences in temperature. It can be improved by joining in a zigzag series several couples: first, a piece of bismuth, then one of antimony, then one of bismuth, etc., the first end of the first piece of bismuth and the last end of the last piece of antimony being joined by a wire passing around a galvanometer. Thus every other junction of bismuth and antimony is turned to form one face of the zigzag; and, if one face is at a higher temperature than the other, each couple helps the others, and thus a considerable current may be produced through the galvanometer. Such a combination of couples forms a thermopile. It was invented by Nobili in 1834.

Since the action of a thermocouple depends upon raising the temperature of one junction, it is evident that the sensitiveness of the instrument will be increased if the quantities of metal used at the junction are very small, so that in return for a small quantity of heat there will be a large rise in temperature. It will be increased still more if the instrument is in a vacuum so that the junction does not lose heat by convection currents. Applying these principles A. H. Pfund in 1913 constructed a thermocouple by means of which he was able

to measure the radiation of heat from some of the fixed stars. See THOMSON EFFECT.

THERMOHYDROMETER. See HYDROMETER.

THERMOMETER (from Gk. *θερμη*, *thermē*, heat + *μέτρον*, *metron*, measure). An instrument for measuring temperature, but in early times erroneously supposed to measure heat. A brief account of the underlying theory and the history of thermometry are given under the title THERMOMETRY. This article will deal only with those forms of thermometers that are at present in ordinary use.

Air or Gas Thermometer. This form of the instrument is accepted as the standard and the indications of mercurial, alcohol, or other thermometers are all supposed to be corrected so as to agree with the standard adopted by the International Bureau of Weights and Measures at Paris. This standard consists of a hollow bulb of platinum filled with pure, dry hydrogen. When kept at a uniform pressure the volume of the gas expands in direct proportion to its temperature. By calling the volume at the melting point of ice V , and the volume at the boiling point of water $V + 100^{\circ}$, we establish a scale of Centigrade degrees, which may be extended above or below these limits, so that, e.g., the temperature of the absolute cold or entire absence of heat would be -273°C . and the temperature of the boiling point of mercury would be about $+357^{\circ}\text{C}$. Numerous precautions

are needed in the use of the air thermometer, all of which are explained in the *Travaux et mémoires* of the International Bureau of Weights and Measures, and in Guillaume, *Thermométrie* (Paris, 1890). According to the theories of thermodynamics the peculiarities of platinum, hydrogen, or of any other materials that may be used, introduce small irregularities, so that the scale of equal changes of volume is not exactly proportional to the quantity of heat or the change in temperature. Therefore some recommend that a slight correction be applied to the hydrogen gas thermometer in order to obtain the ideal thermodynamic equivalent. The hydrogen gas thermometer at the present time, however, constitutes the fundamental standard, and all other forms are secondary in nature and their indications are ultimately corrected to give the gas scale of temperatures.

In Fig. 1 we see a simple or portable form of air thermometer, as arranged by Joly, for measuring temperatures below the boiling point of water. The large glass bulb on the left is filled with dry air, or dry hydrogen, and ends in a short vertical glass tube attached

FIG. 1.
JOLY AIR THERMOMETER.

to the flexible rubber tube whose other end opens into another short glass tube, shown on the right-hand side, whose upper end is hermetically closed and constitutes the vacuum chamber of a barometric column of mercury. The glass bulb is immersed in a liquid or gas whose temperature is to be measured. If the volume of the inclosed gas expands with the higher temperature that is to be measured, then this expansion is counterbalanced by raising the vacuum chamber and the flexible tube on the right until the increased pressure of the mercury column compresses the expanding gas in the large bulb so as to keep it at a constant volume, which is indicated by the fact that the mercury in the left-hand tube just touches the tip of a fine glass point that is permanently fastened inside the tube. The pressure exerted by the mercurial column is measured by the difference in the level of the mercury in the right-hand and left-hand tubes. The scale for this measurement is graduated on a strip of mirror set into the vertical framework that supports the bulb and the tubes.

In Fig. 2 we see an arrangement of the air thermometer for more exact measurements, etc. The thermometric substance is inclosed in the

FIG. 2. CHAPPUIS AIR THERMOMETER.

platinum bulb *A*, which is supported inside of a bath, *B*, which is so arranged that the hot gas or liquid whose temperature is to be measured may completely surround the bulb by flowing in at *E* and out at *F*. *DD* are metal screens. There are a number of mercurial thermometers, *T*, which are at the same temperature as the bulb. The bulb communicates with the barometer at *G* by the tube *C*, the connection being shown enlarged at *V*. The pressure of the mercurial column needed to keep the gas in the bulb at a constant volume is that due to the height of the column from *X* to *Y*, and may amount to several atmospheres, or to a height of many feet. The lower end of the

mercurial column, or the tube *H*, *I*, *J*, *K*, is fixed, but the upper tube, *PQ*, can be raised indefinitely. As *Q* rises inside of the large tube, *J*, more mercury may be needed, and this is supplied from the reservoir, *R*, through the flexible tube, *L*. The difference in height between the mercurial surfaces at *X* and *Z* is measured by a reading telescope or cathetometer. *M* is the upright standard carrying the apparatus, *N* a movable cradle for the barometer tube worked by the adjusting screw *O*. *S* is a similar arrangement for the reservoir, *R*, with its adjusting screw, *U*.

Mercurial Thermometer. This consists of a glass bulb terminating in a long capillary tube. The bulb and lower portion of the tube are filled with clean mercury, while the upper portion is supposed to be quite empty and to be hermetically sealed. When the bulb is warmed the mercury is seen to rise in the tube, because it expands more than the glass of the bulb. This difference of expansion is not regular, nor is it the same for all kinds of glass or for impure mercury. If we wish to construct an independent standard mercurial thermometer, we immerse the bulb in melting ice and make a slight scratch on the glass tube to mark the height of the mercurial column. A similar mark is made at the end of the column when the thermometer is immersed wholly in the steam from boiling water, the exact temperature of the steam depending upon the air pressure at the time. The space between the two lines is divided into 100 more or less equal parts for Centigrade degrees, or 180 equal parts for Fahrenheit degrees, according to the exact temperature found for the boiling water. The space between the freezing point and the boiling point on a thermometer scale is called the fundamental distance. Owing to the irregular expansion of mercury in glass, the so-called standard mercurial thermometer will differ from the standard air thermometer by as much as half a degree about midway between freezing and boiling water. Therefore for accurate work the mercurial should be carefully compared with the air thermometer and the resulting system of corrections throughout the entire length of the scale should be well determined and carefully applied. Owing to the gradual contraction of the glass bulbs, which goes on for several years after they are freshly made, the mercurial thermometer usually has an error that increases with the lapse of time. This error is due to the change in the volume of the bulb, and should be determined after any important work has been done by immediately making a new determination of the freezing point. Instead of this procedure the error can be calculated theoretically, but the actual new determination is far preferable.

A thermometer is not considered first class whose errors of division exceed one or two tenths of a degree Centigrade, or two or three tenths Fahrenheit, especially if these errors change values greatly from point to point along the scale. In determining the temperature of a liquid by the use of the mercurial thermometer one must be very careful to keep the liquid thoroughly stirred, because when permitted to rest the colder portions of the liquid settle. In meteorological work all thermometers are exposed in some sort of protecting cage through which the wind may blow freely, but into which the sun's rays, or any obnoxious radiation, can-

not penetrate. It is believed that after making due allowance for the sluggishness of the thermometers and the inefficiency of the screens and the ventilating apparatus, it is still true that the various meteorological services of the world obtain the temperature of the air within a half degree Fahrenheit or two-tenths Centigrade. A general comparison between the Centigrade and Fahrenheit scales is here given.

Cent.	Fahr.	Cent.	Fahr.
+125°	+257°	0°	+ 32°
100	212	-17.8	0
75	167	25	- 13
50	122	40	40
+ 25	+ 77	-273	-491

Dew-Point Thermometer. This is an ordinary thermometer specially arranged for the determination of the temperature at which dew is formed in the atmosphere when the air is cooled. To this end the bulb and larger part of the stem of the thermometer are immersed in a thin glass cup nearly full of sulphuric ether. A current of air is driven through the ether, causing it to evaporate and therefore to cool. The thermometer follows the falling temperature of the ether until the observer perceives the deposition of dew on the outside of the glass cup. The current of air is then cut off. The ether and glass cup begin to warm; the dew evaporates from the surface, and as it disappears the temperature is again read off. The mean of the two readings of the thermometer corresponds closely to the dew point. The results are most exact when the cooling is so carefully conducted that the dew forms and disappears with an inappreciable change in temperature of the thermometer. See **HYGROMETER**.

Wet-Bulb Thermometer. This is an ordinary thermometer whose bulb is covered very neatly with the thinnest muslin, which is kept wet. The wet-bulb thermometer should either be rapidly whirled in the air or else exposed

Alcohol Thermometer. This differs from the mercurial thermometer only in that the interior liquid is alcohol. But this difference is important from many points of view, since one class of errors disappears and another is introduced. Alcohol, ether, and in recent years toluol, are used in thermometers for the measurement of very low temperatures, since mercury freezes at about -40° Fahrenheit. The principal error in using such liquids for low temperatures arises from the fact that the liquid adheres to the sides of the glass tube and requires a long time to drain down, which indeed it never does perfectly.

Solar-Radiation Thermometer, or Black-Bulb Thermometer. This is essentially an ordinary mercurial thermometer, whose bulb is covered with a thin layer of nonreflecting and almost perfectly absorbing lampblack. Under the assumption that the black-bulb thermometer absorbs and radiates more easily than the plain glass bulb, and especially more so than a polished silver bulb, the difference between the readings of two such thermometers exposed to the sunshine will depend primarily upon the intensity of the radiation received by them. In order to measure the solar radiation, it is necessary, first, to diminish as much as possible the conduction and convection of heat to or from thermometer bulbs. They are, therefore, inclosed in large thin glass bulbs within which there is as perfect a vacuum as it is possible to make. It is also necessary to cut off as much as possible of radiation from the surrounding objects, and especially reflected sunshine, by means of screens. Under these conditions the solar-radiation thermometer, or the so-called Arago-Davy actinometer, may be used in two ways: (1) The static method. The thermometers are allowed to attain the highest temperatures they can in the full sunshine; the difference between their readings expresses approximately the intensity of the solar radiation, the exact value of which may be more exactly computed by the method and formulæ given by Pro-

UNITED STATES WEATHER BUREAU MAXIMUM AND MINIMUM THERMOMETER.

to a current of air at the rate of five or ten feet a second. The evaporation of the water cools the thermometer to the temperature of evaporation, which is about half way between the temperature of the air and the temperature of the dew point. The combination of a dry-bulb and a wet-bulb thermometer constitutes a psychrometer, and the whirled or ventilated psychrometer is the ordinary apparatus used by meteorologists for determining the humidity of the atmosphere. The formulæ and tables used by the Weather Bureau in this work are those prepared by Prof. C. F. Marvin and published as Weather Bureau No. 235 (Washington, 1900). See **HYGROMETER** for illustration and further description.

fessor William Ferrel in his memoir "Temperature of the Atmosphere and Earth's Surface," pages 34-50, *Professional Papers of the Signal Service, No. 13* (Washington, 1884). (2) The dynamic method. The bright and black-bulb thermometers are successively exposed to the full sunshine and shaded from it a minute at a time, so that one may determine the initial rate of increase of temperature in the sunshine and the rate of cooling in the shade. From these rates the solar radiation is calculated by the formulæ first applied by Pouillet to his actinometer. Much more exact methods of measuring radiation are now employed. See **PYRHELIOMETER**.

Maximum Thermometer. This is usually a mercurial thermometer having a device by

which the top of the column of mercury remains at the highest point that it attains during any given interval of time until the observer has recorded the reading and adjusts the instrument for another observation. In the Rutherford maximum the stem of the thermometer lies nearly horizontal. The rising mercury pushes a little steel index upward within the bore of the tube. When the temperature falls the index is left in place until the observer draws it back to the top of the mercurial column by means of a magnet. In the Phillips or Walferdin thermometer the thermometer stem is horizontal. A small bubble of air makes a permanent break in the upper part of the mercurial column. When the temperature begins to fall the lower column contracts into the bulb, but the upper portion remains and registers the maximum temperature. The Negretti and Zambra maximum thermometer has the bore of the tube constricted below the bottom of the scale so that the mercury that has pushed up past this point cannot easily slide back. After the maximum temperature has been recorded the observer forces the column of mercury back by whirling the ther-

in America for determining the temperature of the human body (mouth or rectum). The bulb is of high-grade thin glass, and the stem is oval in cross section, forming a cylindrical lens which serves to magnify the capillary mercury thread. Temperatures from 94° F. to 110° F., graduated in one-fifth degrees, are engraved on the front of the lens face. The thermometer registers the highest temperature to which it is exposed. The self-registering device is usually obtained by forming a constriction or trap in the capillary tube between the bulb and the lowest temperature graduation on the scale, of exactly the correct size, such that the mercury may expand through the contraction in fine globules, but cannot flow back. From one-half to three minutes are required to obtain the final temperature indication when placed in the mouth, and before the thermometer is used again the mercury column must be shaken down into the bulb. To avoid the possible objection that the temperature graduations, which are in part filled with black coloring matter, may retain disease germs not readily removable by antiseptic liquids, clinical thermometers are sometimes made with the

CLINICAL THERMOMETER.

mometer in a circle. The clinical thermometers of physicians are made after this pattern.

Minimum Thermometer. The best form of this is the Rutherford alcohol minimum, in which the stem is kept nearly horizontal, and the contracting column of alcohol draws downward a glass index, which remains in place when the temperature rises. The observer sets the index anew by inverting the instrument, when the index slowly falls to the end of the column of alcohol.

Combined Maximum and Minimum or Six's Thermometer. This consists of a U-shaped tube whose upper ends have respectively a large bulb full of alcohol and a small bulb partly full of alcohol. The lower portion of the legs of the U is filled with mercury and in each leg there floats an index. One of these indices is forced up by the expansion of the alcohol in the bulb and the index is left at the maximum temperature. The other index is raised by the contraction of the alcohol and the consequent rising of the mercury which is pushed up by the expansive force of the air pressure in the small bulb. Modifications of this thermometer are used in Austria, England, and America, but none of its forms is considered to be so reliable as the separate maximum and minimum thermometers previously described.

Upsetting Thermometers. These were invented by Negretti and Zambra and have been modified and improved from time to time. An ordinary thermometer has its tube so bent that when the thermometer is turned upside down the column of mercury above the constriction will run off into a separate portion of the tube, where it remains until the observer can make the necessary reading. The thermometer is especially adapted for recording deep ocean temperatures or temperatures at any hour of the night.

Clinical Thermometers. These are used to determine the body temperature of animals. The figure illustrates one of the more common forms of mercury in glass clinical thermometers used

scale inclosed in a smooth glass tube, or a thermometer of the type illustrated is completely covered by a thin glass envelope.

Metallic Thermometers. These depend for their action upon the differential expansion of metals. As made by Breguet, 1817, or Herrman and Pfister, 1865, they consist essentially of two thin spiral bands of different metals soldered together. Differences of temperature cause the spiral to coil or uncoil and the apparatus can easily be adapted for self-registration.

Optical Thermometers. The plane of polarization of a quartz crystal is rotated about the axis of a beam of light by the varying temperature of the quartz, increasing with great regularity with the increase of temperature. This apparatus is recommended by Cornu for the study of high temperatures when the gas thermometer fails because of the softening of the bulbs containing the gas or air.

Thermoelectric Thermometers. Melloni's thermoelectric pile. Pairs of pieces of different metals are soldered together and the extremities communicate by a wire with a needle galvanometer or voltmeter. Any difference of temperature between two consecutive junctions causes the electric current to traverse the wire; its strength is an index of the temperature. The absolute value of the galvanometer scale can be expressed in thermometric degrees by means of careful comparisons. The thermoelectric thermometer can be made to give extremely reliable results.

Resistance Thermometer. Metallic conductors of electricity, such as iron, nickel, platinum, and the like, change their resistance with change of temperature, and this property is utilized in the construction of electrical resistance thermometers which have now become one of the most convenient forms of secondary thermometers available for precise temperature measurements. On account of the permanence of its properties and the wide range of temperatures over which it may be employed, pure platinum

in the form of wires or other appropriate shape is generally best suited for exact work, but nickel is also excellent for many purposes, especially for ordinary temperatures. One great superiority of resistance thermometers is their adaptability to almost any requirements and the further fact that the measuring apparatus may be located at some distance from the wire resistance coil, the two being connected by appropriate leads arranged to eliminate the effects of their resistance. A Wheatstone bridge with accessories is employed to measure the resistance of the platinum coil. In some cases a potentiometer is employed for the same purpose. The indications of resistance thermometers must be reduced to the gas state by appropriate corrections found by comparisons.

Thermophone. This is a resistance thermometer, with which a telephone instead of a galvanometer is used to adjust the Wheatstone bridge to a balance. The equality of resistance is indicated by the absence of all sound when one listens at the telephone. This instrument, the invention of G. C. Whipple, is both accurate and portable and very convenient for use in boats on lakes or at sea. Consult "The Thermophone," in *Technology Quarterly*, vol. viii, p. 25 (Boston, 1895).

Langley's Bolometer. This is a differential thermometer in which the difference of temperature of two delicate wires is shown by the deflections of a galvanometric needle. See **BOLOMETER**.

Deep-Sea Thermometer. This is an ordinary or self-registering mercurial thermometer wholly inclosed within a very strong protecting case of glass. The space between the thermometer and its inclosure is partly filled with water or mercury above which some air remains. When this arrangement is lowered to the bottom of the ocean the great external pressure compresses the inclosure but does not seriously affect the bulb of the thermometer within.

Soil Thermometer. This was formerly made with a large bulb and wide tube many feet in length, so that a bulb buried at a depth of even 20 feet would show the top of the liquid column above the surface of the earth. As these were expensive, sluggish, and liable to accident, the modern practice is to use an ordinary thermometer inclosed in a wooden tube and pushed down to the proper depth in a hole in the ground. Modern electric thermometers, especially the thermophone, are to be recommended.

Nocturnal-Radiation Thermometer. This is supposed to give the approximate temperature of a surface exposed to radiation during the nighttime. The bulb is of glass, sometimes, but not necessarily, blackened; it is fully exposed to the open sky. If all terrestrial heat is cut off by screens the thermometer may be made to give an indication of the clearness of the sky or the temperature of the air that occupies the dome of the sky. If, however, no attempt is made to cut off the radiation and conduction of heat, the thermometers give the temperature of the leaves on the trees. If the thermometer lies upon the upper surface of a metal or wooden or stone object, it gives approximately the temperature of the upper surface layer of that object.

Integrating Thermometer. This is intended to sum up the temperature, or it may be the temperature changes, during any given interval of time. A clock or chronometer whose pendulum

or balance wheel is uncompensated or even intentionally overcompensated has a rate that varies with the temperature and becomes an admirable integrator. A metal bar, supported on an inclined surface by means of sharp-pointed feet at either end, creeps upward with alternating rising and falling temperatures. Each step of its progress is proportional to the difference between the successive maxima and minima. Thus, such an arrangement will, in the course of a month, sum up the daily ranges of temperature.

Evaporation Thermometer. In 1888 Dr. Müller-Erzbach brought out a thermometer in which a vessel full of water in the sunshine communicates with an empty vessel in the shade. The water evaporated in the former condenses over into the latter vessel, where it is absorbed by concentrated sulphuric acid. The weight lost in one vessel or gained in the other is an index to the average temperature that has prevailed in the water flask. Comparative observations give the means of converting these weights into temperatures. Experimental tests of this form of integrating thermometer made at the Seewarte in Hamburg show that this apparatus gives excellent results when the daily temperature variations are not too great.

Thermographs. This term may include all forms of apparatus in which continuous registration is introduced. To this end the English Meteorological Office employs photography, maintaining a continuous photographic register of the variations of the top of the mercurial column. The French and the United States Weather Bureaus use the thermographs made by Richard at Paris, in which some form of metallic thermometer is attached to a pen which moves vertically over a sheet of paper that is drawn horizontally by clockwork so that the temperature may be subsequently read off at any given moment.

Owing to the great importance of the thermometer in every branch of science and the arts, the principal governments of the world have established bureaus of standards for the comparison and calibration of this and other forms of measuring apparatus. In all cases private individuals may send their thermometers to these institutions for examination and may receive certificates stating the exact value of the corrections for their errors if any exist. Such institutions are the following: the Kew Observatory at London, now a branch of the Bureau of Standards; the Imperial Physical and Technical Institute at Charlottenburg, near Berlin; the International Bureau of Weights and Measures, Paris; and the Bureau of Standards established by the United States government at Washington, under the Treasury Department in 1900, and later transferred to the Department of Commerce. See **THERMOMETRY**.

THERMOMETER, CLINICAL OR MEDICAL.
See THERMOMETER.

THERMOMETRY (from Gk. *θερμη*, *thermē*, heat + *-μετρία*, *-metria*, measurement, from *μέτρον*, *metron*, measure). The science of assigning proper numerical values to the temperature of bodies. As explained in HEAT, this involves several steps, the arbitrary selection of (1) some substance as the thermometric body, (2) some property of it which changes with the temperature, (3) two standard thermal states, e.g., melting ice and boiling water at standard pressures, (4) the scale or the number of degrees between these standard temperatures, and (5) two arbitrary numbers to represent these standard temperatures.

By definition the temperature on the standard hydrogen thermometer, Centigrade scale, is as follows:

Hydrogen is the gas used, the initial pressure being 100 cm. of mercury. Change in pressure at constant volume is the effect measured.

The two standard thermal states are (1) melting ice and (2) vapor rising from boiling water at normal atmospheric pressure.

One hundred degrees are chosen between these two temperatures. The temperature of melting ice is called 0°. Then, if p_0 is the pressure of the gas at 0°, p_{100} that at 100°, and p that at the temperature (t) to which a number is to be given,

$$t = 100 \frac{p - p_0}{p_{100} - p_0}$$

Other gases than hydrogen might be used; and the same definition would apply to temperature on the new scale as on the hydrogen scale. Slight differences, however, would always be observed between the numerical values for the same temperatures.

If the change in volume is the heat effect observed as the temperature is changed, the pressure being kept constant, the obvious definition of the numerical value of the temperature is

$$t = 100 \frac{v - v_0}{v_{100} - v_0}$$

where v_0 , v_{100} , v are the measured values of the volume of the gas or liquid at 0°, 100°, t °.

If the change in the electrical resistance of a given conductor is the heat effect measured as the temperature is changed, the definition of t is

$$t = 100 \frac{R - R_0}{R_{100} - R_0}$$

where R_0 , R_{100} , R are the electrical resistances at 0°, 100°, t °.

Similarly almost any heat effect of any body may be taken as the one to measure in order to secure a number for temperature; but the numbers so found all differ in general; and if any thermometer other than the hydrogen one is actually used, the observed numbers must all be corrected by a calibration table connecting the scale of the thermometer used with the hydrogen one.

For measuring ordinary laboratory temperatures either mercury-in-glass or air thermometers are used; for measuring extremely low temperatures, e.g., -200° C., a hydrogen thermometer or a platinum-resistance thermometer is generally used; for high temperatures, e.g., 300° C., a platinum-resistance thermometer or a thermocouple is used. (See PYROMETER; THERMOMETER; THERMOELECTRICITY.) For a full discussion

of these and other methods reference should be made to the *Reports* of the International Congress of Physics, Paris, 1900, vol. i, articles by Chappuis and Barus, and specially to the publications of the National Bureau of Standards, Washington, D. C.

The scale of temperature as defined above is known as the Centigrade or Celsius (q.v.) scale. There are several other scales in use. The Fahrenheit scale has 32° for the melting point of ice and 212° for the boiling point of water; the Réaumur (q.v.) scale has 0° for the former temperature and 80° for the latter.

It is evident that the definition of temperature as given above is equivalent to stating that in the equation connecting change of pressure with change of temperature, viz.,

$$p - p_0 = \alpha p_0 \theta,$$

α is a constant, the same at all temperatures. This quantity is called the coefficient of expansion at constant volume. Its numerical value for hydrogen is closely $\frac{1}{273}$. Writing the last equation

$$p = p_0(1 + \alpha t),$$

it is evident that if $t = -273$, $p = 0$. For a value of t less than this, the pressure would be negative, which is meaningless. Therefore $t = -273$ is the lowest number which this instrument can give; and the corresponding temperature is called absolute zero on the gas scale. If 273 is added to the temperature as defined above on the Centigrade scale, i.e., if temperatures are calculated from absolute zero instead of from the temperature of melting ice, the scale is called the absolute gas scale. Or, in the general case, the absolute gas scale adds to the temperature on any scale the reciprocal of the coefficient of cubical expansion of hydrogen as determined on that scale—the Centigrade scale this reciprocal is 273.04, and so t ° C. is $(t + 273.04)$ ° absolute. It is shown in thermodynamics (q.v.) that there is a method of defining temperature which is quite independent of the thermometric substance, and in which the only arbitrary things are the choice of a number for the difference between the temperatures of any two thermal states. This scale is called Thomson's absolute scale, because it was proposed by William Thomson (later Lord Kelvin). If it is agreed to have the temperature of freezing and boiling water 100° apart, it is found that the numbers on the Thomson absolute scale agree most remarkably with those given on the absolute gas scale as defined above.

In the practical use of thermometers there are numerous precautions and corrections which are necessary, and for these reference must be made to some laboratory handbook.

The range of applicability of ordinary thermometers is limited in many ways: the liquid may freeze or may evaporate; the material of the bulb may change its volume or it may absorb some of the gas if it is a gas thermometer, etc. Thus a mercury thermometer cannot be used with accuracy above about 450° C.; a hydrogen thermometer cannot be used above 500° C.; nor a nitrogen thermometer above 1550° C.; and at these high temperatures extraordinary precautions are necessary if accuracy is to be secured. Within recent years methods for giving numbers to temperatures much higher even than these referred to have been perfected, based upon laws of radiation (q.v.). It has been shown

from theory that there are two laws connecting temperature with the radiation from a black body. These may be stated as follows:

1. The total radiation from 1 sq. cm., $E = aT^4$.
2. The radiation associated with waves whose wave lengths lie between λ and $\lambda + d\lambda$, $Jd\lambda = \frac{c}{\lambda^5} e^{-\frac{b}{\lambda T}} d\lambda$, provided the waves are short, i.e., visible. Where T is the absolute temperature on Thomson's scale, λ is the wave length, e is the base of the natural system of logarithms, and a , b , and c are constants. Calling $T = 273 + t^\circ \text{C}$, it is possible to test the laws by measuring the radiation from black bodies whose temperatures are determined by nitrogen thermometers. In this way the values of the constants a , b , and c may be deduced. Then, in order to determine the temperature of any black body at any temperature, no matter how high, either the total or the partial radiation may be measured; and since the constants are now known, the value of T may be deduced. This scale of temperature is called the radiation scale. It is obvious that the method just indicated can be applied to studying the temperatures of black bodies only. But, if there is any body at a high temperature, it must be possible to have a black body at a somewhat lower temperature whose total radiation is the same as that of the former, in which case, if the total radiation from this is measured and T calculated, it is the temperature not of the body but of the equivalent black body—this T is less than the temperature of the body, and is called its black-body temperature with total radiation. Similarly, if a partial radiation method were used, a value of T would have been found, less than the actual temperature, called the black-body temperature with radiation of a definite wave length. C. E. Mendenhall has devised a method by which for different metals it is possible to find the difference between their true temperature and their black-body temperature; and so, if the latter is observed, the former may be deduced.

Several types of instruments have been constructed for obtaining black-body temperatures; one set making use of the Stefan-Boltzmann law $E = aT^4$; the other, of Wien's law

$$J = \frac{c}{\lambda^5} e^{-\frac{b}{\lambda T}}.$$

One of the best known of the former is the Fény radiation pyrometer, which is essentially an instrument for measuring total radiation. This is allowed to fall upon a blackened disk whose temperature is read by a thermocouple. In practice the instrument is calibrated by measuring the E. M. F. of the thermocouple when the instrument is exposed to radiation from a black body whose temperature can be varied and measured. Then, when the instrument is directed to the body whose temperature is desired, the E. M. F. is measured and the corresponding temperature found from the calibration values.

In the use of Wien's equation $J = \frac{c}{\lambda^5} e^{-\frac{b}{\lambda T}}$, where the partial radiation only is studied, λ is a constant, and the equation can be put in the more convenient form $\log J = A - \frac{B}{T}$, where for a known value of λ , both A and B are known constants. Therefore, to determine T it is necessary to measure J . There are two well-known instruments in ordinary use, the Wanner and

the Holborn-Kurlbaum optical pyrometers. In the former instrument the light from the body whose temperature is desired and also that from a standard electric lamp is dispersed by a prism (or passed through a colored screen, e.g., a piece of colored glass), and only light of one color used; and that from the standard lamp is weakened in intensity by known fractions until it equals that from the hot body; then the intensity of the standard lamp is compared with that of the light of the same color from a black body of a known temperature, one being altered by known fractions until they are equal. Thus, by the use of the above formula, the value of T may be deduced. What this procedure really amounts to is this: by the latter observation the intensity of the standard source is measured, since A , B , and T are known; by the first observation the intensity of the light from the body whose temperature is desired is measured in terms of that from the standard source—then, since J , A , and B are known, T may be deduced. In comparing the intensities of the two lights, a polarization photometer is used.

The Holborn-Kurlbaum instrument is essentially a telescope containing in the focus of the eyepiece the filament of an electric lamp, the current through which can be varied. Light of one color is secured for all the observations by the use of absorbing screens. In order to calibrate the instrument, it is pointed so as to receive the radiation from a black body, whose temperature can be varied and can be measured; the instrument is focused so as to bring the light from the black body into focus exactly in the plane of the filament of the lamp; the current through this is varied until the filament disappears against the background, showing that the intensities of the two are equal. The temperature of the black body and the current in the lamp are noted; the former is changed and the corresponding current is observed, etc. Then, to determine the black-body temperature of any surface, the instrument is focused upon it and the value of the current in the lamp is observed, which corresponds to the disappearance of the filament; by means of the calibration the temperature may be deduced at once. The instrument may be used in a different manner by applying a revolving sector disk to lower the intensity of the light.

History. The invention of the thermometer must be attributed to Galileo, who in about the year 1593 made an open-air thermoscope, consisting of a bulb with a long tube attached, which was provided with a scale and dipped below the surface of a liquid—water or wine; some of the air was expelled from the bulb, and so the liquid rose in the tube. This thermometer was used by Galileo for various purposes, such as studying freezing mixtures and recording atmospheric temperatures. It was later used (1611) by Sanctorius in the diagnosis of fevers. The word "thermoscope" was used by Bianconi in 1617 and "thermometer" in 1624 by Leurechon. The first scaled thermometers were those of Ferdinand II, Grand Duke of Tuscany (1641); these contained alcohol. In 1661 Fabri made a scale, using as the fixed temperatures those of snow and of midsummer heat. Robert Hooke in 1664 proposed the freezing point of water as one of the fixed temperatures; and in 1694 Renaldini proposed this as one, and the boiling point of water as the other. In 1709 Fahrenheit introduced his alcohol thermometers, and in 1714

his mercury ones. About 1731 Réaumur devised his scale, which until recently was in extensive use on the continent of Europe. In 1742 Celsius proposed a Centigrade scale, with the temperatures of melting ice 100° and boiling water 0°. Christin, working independently of Celsius, proposed a Centigrade scale in 1743 which is the Celsius scale inverted, and is the one used now. See RADIATION; THERMOMETER. For bibliography, see THERMOMETER.

THERMOPHONE. See THERMOMETER.

THERMOPHILE. See THERMOELECTRICITY.

THERMOPYLÆ (Lat., from Gk. Θερμοπύλαι, from θερμός, *thermos*, hot + πύλα, *pyla*, gate). A pass famous in ancient Greek history, leading from Thessaly into Locris, named from the presence of several hot springs (Map: Greece, Ancient, C 2). It lies south of the present course of the river Sperchius, between Mount Ceta and the Maliac Gulf. In ancient times it was only a narrow track, less than 50 feet wide, but the alluvial deposits have altered the coast line so that there is now a broad swampy plain from a mile and a half to three miles broad. Thermopylæ has won an eternal celebrity as the scene of the heroic death of Leonidas I (q.v.) and his three hundred Spartans in their attempt to stem the tide of Persian invasion (480 B.C.). But he was betrayed by Ephialtes, a Thessalian, into the hands of the Persians, who advanced by a path over the mountains and fell upon his rear. In 279 B.C. a large army of Greeks held Brennus and his Gauls at bay until they also found a path over the mountains. The Greeks, however, escaped on their fleet. Again, in 191 B.C., Antiochus endeavored to check the Romans at this point, but Cato stormed the fortress which commanded the path, and, aided by a frontal attack of the main force, routed the Syrian army. Consult *Herodotus*, vii, 175 ff., with the commentary by Messrs. How and Wells, vol. ii (Oxford, 1912), and that by Macan (London, 1908). Consult G. B. Grundy, *The Great Persian War* (London, 1893); K. Baedeker, *Greece* (4th Eng. ed., Leipzig, 1909).

THERMOS BOTTLE. See LIQUEFACTION OF GASES.

THERMOSCOPE (from Gk. θερμη, *thermē*, heat + σκοπεῖν, *skopein*, to look). A device to indicate relative temperatures by making use of the property possessed by substances of changing their state or volume under the influence of heat. See THERMOMETER.

THERMOTHERAPY. See HOT-AIR TREATMENT; THERAPEUTICS.

THERMOTROPISM (from Gk. θερμη, *thermē*, heat + τροπή, *tropē*, a turning, from τρέπειν, *trepein*, to turn). Primarily, the sensitiveness of plant organs to unequal temperatures on opposite flanks which causes them to bend (positively) towards or (negatively) away from the higher temperature. The same organ may be both positively and negatively thermotropic at different ranges of temperature.

THEROIGNE DE MERICOURT, tā'rwān'y' de mā'rē'kōōr' (1762-97). A prominent figure during the French Revolution. She was born at Marcourt, near Liège. Her true name was Anne Joséphe Terwagne. Knowing all the leaders of the Revolution, she became an enthusiastic Republican and the commander of the mobs of women that played such a conspicuous part in the dramatic days of the Revolution. Armed with sabre and pistol, she led her feminine battalions against the Bastille, July 14, 1789, to Versailles on October 5-6 of the same year, and after her

return from an Austrian prison was prominent during the disturbances on June 20 and Aug. 10, 1792. In May, 1793, while defending the Girondist Brissot, her lover, she was seized, stripped, and whipped by a mob of maddened women. She became insane from this treatment, and spent the rest of her life in La Salpêtrière.

THEROMORPHA (Neo-Lat. nom. pl., from Gk. θήρ, *thēr*, wild beast + μορφή, *morphē*, form). A name applied to several widely dissimilar groups of fossil reptiles which possess certain common characters of skull, vertebrae, limb girdles, and digital formula. Another ordinary name, Anomodontia, is often used synonymously with Theromorpha. The theromorphs, together with the turtles and plesiosaurs, compose the great reptilian division Synapsida (Osborn), characterized by certain mammal-like features of the skull and the mammalian digital formula. All known theromorph remains have been found in the rocks of Permian and Triassic age. They were for the most part animals of rather heavy build, adapted to land life and sluggish habit, though one group appears to have been marine. The following suborders are commonly recognized:

(1) **COTYLOSAURIA** or **PAREIASAURIA**. A group of reptiles having a solid cranial roof with a large pineal foramen, and usually with teeth on the vomer, pterygoid, and palatine bones. It is probable that these forms stand closest to the ancestral Stegocephalia or armored Amphibia.

SKULL OF A THERIODONT (*Galesaurus*).

The best-known example is *Pareiasaurus*, from the Karoo beds of South Africa, a heavily built land animal, 8 feet long. (2) **THERIODONTIA**. A group which closely resembles mammals in the differentiation of the teeth into incisors, canines, and molars, and in certain features of the skull. Most genera have a distinctly carnivorous dentition, but a few, the Gomphodontia, have crushing molars. Nearly all the known theriodonts are from the South African Trias. *Cynognathus*, in which the skull is remarkably doglike, equaled the black bear in size and general proportions. Many zoölogists believe that mammals have been derived from theriodonts. (3) **DI-CYNODONTIA**. Land reptiles from the Trias of Scotland and South Africa, known chiefly from the skull, which is greatly modified, having the teeth entirely wanting, as in *Udenodon*, or reduced to a single pair of large tusks in the upper jaw, as in *Dicynodon* and *Gordonia*.

More recent research seems to show that it is advisable to separate the Cotylosauria from the mammal-like reptiles proper, and to place these latter in an order, Therapsida. This order may be subdivided into five groups or suborders. (1) **DINOCEPHALIANS**. These form a well-marked group of large, heavily built, herbivorous reptiles, which occur in South Africa and Russia, and are especially interesting from their forming a connecting link in essential structure between the pelecosaurs of America and the more mammal-like reptiles of South Africa. (2) **DROMASAURIANS**. A group of small, ratlike run-

ning reptiles, which form the earliest-known direct ancestors of the mammals. (3) ANOMODONTIA. Synonymous with the Dicynodontia above mentioned. (4) THEROCEPHALIANS. A group of carnivorous reptiles living in Middle and Upper Permian times in South Africa and Russia. Though in many points of structure they closely agree with the anomodonts, they have a series of pointed incisors, one or two large canines, and a number of small, pointed molar teeth. (5) CYNODONTIA. These are the extremely mammal-like carnivorous reptiles which flourished in Middle and Upper Triassic times in South Africa. They resemble the mammals in the complicated structure of the molar teeth, in the structure of the skull, and in the joints of the toes, and there is little doubt that the later mammals are descended from a member of this order.

THERON (Lat., from Gk. Θήρων) (?-472 B.C.). A tyrant of Agrigentum (q.v.), c.488-472 B.C. He aided Gelon (q.v.) to win the great victory over the Carthaginians at Himera, in 480 B.C. (See SICILY, *History*.) Consult G. Grote, *Greece*, chap. xliii, and E. A. Freeman, *History of Sicily*, 4 vols. (Oxford, 1891-94).

THEROPODA. See DINOSAURIA.

THERSITES, thēr-sít'ez (Lat., from Gk. Θερσίτης). In the *Iliad*, ii, the ugliest and most impudent talker among the Greeks assembled before Troy. He is represented as reviling Agamemnon and Achilles, and is beaten by Odysseus for his insolence. Later writers said he was a son of Agrios, brother of Ceneus, and was slain by Achilles, whom he had mocked after the death of Penthesilea.

THÉRY, EDMOND (1854-1925). A French economist, born at Rognac. He was sent by his government to various countries on economic missions, was president of several societies, and was made Commander of the Legion of Honor. He wrote: *Sous l'uniforme* (1879); *Les réformes économiques nécessaires* (1885); *La crise des changes* (1894); *Les valeurs mobilières en France* (1897); *Europe et Etats-Unis d'Amérique* (1899); *Le péril jaune* (1901); *La France économique et financière pendant le dernier quart de siècle* (1900); *La paix armée* (1903); *Études économiques et financières, 1890-1903* (1904); *La banque de France de 1897 à 1909* (1910); *L'Europe économique* (1911); *La fortune publique de France* (1912); *Le régime actuel des chemins de fer en Russie* (1913).

THESAURUS. See DICTIONARY.

THESEUM. See ATHENS.

THESEUS, thē'sūs or thēs'ē-ūs (Lat., from Gk. Θησέως). The national hero of the Athenians, and, next to Hercules, the most famous character of Greek legend. His story owes its prominence largely to the influence of Athens in Greek art and literature, for in the epic Theseus has but small place. A doubtful verse in the *Iliad* associates him, not with Athens, but with the Thessalian Lapithæ and their conflict with the Centaurs, and he appears in the late passage of the *Odyssey* (book xi), which describes the visit of Odysseus to the lower world. The early art knows only the slaying of the Minotaur (q.v.), and seems to have borrowed the type from Mycenaean tradition. Though a thoroughly satisfactory analysis of the Theseus legend is still lacking, it seems probable that it was closely connected with the Marathonian tetrapolis, then crossed to Træzen, whence it returned to Athens. Its first great development

occurred under the Pisistratidæ, when Theseus was recognized as the uniter of Attica, and the type of the gentle and just ruler, beloved of his people, a sort of mythical predecessor of Pisistratus. (See ATHENS, *History*, first paragraph.) Soon after the Persian wars the democracy transformed him into its real founder who protected the injured from other states and forced Creon and Eurystheus to observe justice and humanity. At this time (473 B.C.) his reputed bones were brought from Seyros to Athens with great pomp by Cimon, and an heroön, the Theseum (q.v.), was erected. In origin, Theseus is probably best considered as a beneficent deity, a local parallel to Hercules, who slays monsters and gives peace and security to his worshipers, but, like other nature divinities, descends into the lower world and is subject to the powers of death. Legend made Theseus the son of Æthra, daughter of Pittheus, King of Træzen. His father was commonly said to be Ægeus, King of Athens, though early legend recognized the paternity of Poseidon. (The two versions are really the same, Ægeus being originally a name of the sea god.) He was brought up at Træzen, and on reaching manhood proceeded to his father's residence at Athens. On his way thither across the isthmus he destroyed robbers and monsters who rendered the route unsafe for travelers, such as Periphetes, Sinis, the Cronmyonian sow, Sciron, Cercyon, and Procrustes. (See PROCRUSTES.) On his arrival in Athens he found the sorceress Medea (q.v.) living as his father's wife, and escaped her attempt to poison him only through Ægeus' timely recognition of his own sword and sandals, which he had left in Træzen for his son. Medea fled and Theseus overcame Pallas and his sons, who attempted to secure the royal power. He also bound the Marathonian bull, which was ravaging the tetrapolis. Then came the expedition to Crete to deliver Athens from its tribute to the Minotaur (q.v.). On this voyage he proved his descent from Poseidon by bringing back the ring of Minos from the depths of the sea, and by the help of Ariadne (q.v.) killed the Minotaur. On his way back he founded a festival of Apollo at Delos, to which the Athenians ever after sent an annual embassy.

As his father, Ægeus, had destroyed himself in the belief that his son had perished in Crete, Theseus now became King of Athens and consolidated into one state the twelve independent communities of Attica, in celebration of which event was instituted the festival of the Panathenæa (q.v.). That the festival commemorated such an event is probable, but this does not prove the historical personality of Theseus. Legend also told of his friendship for the Lapith King Pirithoüs, at whose wedding he fought the Centaurs (see LAPITHÆ), with whose aid he carried off Helen to Aphidna, and with whom he finally descended to the lower world that his friend might carry off Persephone as his bride. Pirithoüs never returned, and Theseus remained in captivity till Hercules, on his quest for Cerberus, prevailed on Hades to release him. Athenian legend also told of the great invasion of the Amazons (q.v.) in his reign, of the straits to which they reduced the Athenians, and of their final rout by the hero, who secured as wife their queen, Antiope or Hippolyta (q.v.), by whom he had a son, Hippolytus. Later he married Phædra (q.v.), daughter of Minos and sister of Ariadne. It was said that during his

absence in the lower world Menestheus, with the help of Castor and Pollux, who had come to rescue Helen, made himself King, and that Theseus, unable to reestablish his authority, went to Scyros, where he was murdered by Lycomedes (q.v.). Much in the character of Theseus as it appears in legend seems due to Athenian desire to represent their national hero as the embodiment in heroic times of the virtues on which they prided themselves in historic times, and which the great heroes of the national epic often conspicuously lacked. Consult: J. E. Harrison, *Mythology and Monuments of Ancient Athens* (London, 1890); Otto Gruppe, *Griechische Mythologie und Religionsgeschichte* (2 vols., Munich, 1896); and the article "Theseus" in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

THESMOPHORIA. See GREEK FESTIVALS.

THESMOPHORIAZOUSÆ (Lat., from Gk. *Θεσμοφορίαζουσαι*, *Thesmophoriazousai*, women celebrating the Thesmophoria). A comedy by Aristophanes (about 410 B.C.). It is aimed against Euripides for his innovations and his dislike for women, on account of which he is dragged to justice by women taking part in the Thesmophoria.

THESPESIUS (Neo-Lat., from Gk. *θεσπέσιος*, divinely sounding, divine). An herbivorous ornithopod dinosaur, allied to Hadrosaurus and Iguanodon, which it closely resembles, found fossil in the Upper Cretaceous beds of Colorado, Wyoming, and Montana. It is a large animal, 25 to 30 feet long and 10 to 15 feet high, with medium-sized head, small, almost useless fore limbs, and well-developed three-toed hind limbs upon which it ran in bipedal motion, using its heavy tail to balance the forward portion of the body. Another name for this creature is Claosaurus. A complete skeleton of this animal, mounted as if in the act of running, is in the museum of Yale University. Consult: O. C. Marsh, "The Dinosaurs of North America," in *Annual Report of the United States Geological Survey*, vol. xvi, part i (Washington, 1896); Beecher, "The Reconstruction of a Cretaceous Dinosaur, Claosaurus annectans Marsh," in *Transactions of the Connecticut Academy of Sciences*, vol. xi (New Haven, 1902). See DINOSAURIA.

THESPIÆ (Lat., from Gk. *Θεσπιαί*, *Thespiai*, *Θεσπιά*, *Thespiat*), or **THESPIA**. An ancient town in Boeotia, near the foot of Mount Helicon. Like Platæa (q.v.), it was hostile to the Theban pretension to supremacy in Boeotia (see THEBES), and these two were the only Boeotian cities which refused to give earth and water to the heralds of Xerxes and did not side with the Persians at the battle of Salamis. Seven hundred Thespians joined Leonidas at Thermopylæ (q.v.), and were slain in defending the pass. Thespiæ was burned by Xerxes, but was subsequently rebuilt. Shortly after the battle of Leuctra (371 B.C.) it was again destroyed, and was afterward a second time restored. Here was preserved a marble statue of Eros by Praxiteles (q.v.). On account of the vicinity of Mount Helicon to the town the Muses were called *Thespiades*. The site of the ancient town was near the modern village of Eremokastro.

THESPIS (Lat., from Gk. *Θέσπης*). A native of the Attic deme of Icarus in the sixth century B.C., called the father of Greek tragedy. He introduced an actor to reply to the leader of the chorus, who before had recited the adven-

tures of Dionysus and had been answered by the chorus, and thus made an important step towards the drama.

THES'SALONIANS, EPISTLES TO THE. Two of the Pauline group of New Testament epistles. At Thessalonica, the modern Salonika, then the capital of the Roman Province of Macedonia, a Christian church was founded by Paul, assisted by Silas (Silvanus), about 50 A.D., on the Apostle's second missionary journey (cf. Acts xvii. 1-9). This church was composed, like most of Paul's churches, of a small number of converts from the local Jewish synagogue, together with a much larger number of Gentile Christians. The Jews of the city, however, became so violently hostile that the missionaries, after a stay of not more than a few months, felt that it was best to leave, although the church was still very immature. From Berea, the next stopping place of the missionaries, Paul was driven by persecution started by Jews from Thessalonica. He went on to Athens and eventually to Corinth, where he remained a year and a half (until the fall of 51 A.D.). Anxious and uncertain over the condition of things at Thessalonica, from Athens Paul sent Timothy thither to strengthen and comfort the infant church (1 Thess. iii. 1-2). Timothy rejoined Paul at Corinth with a report that rejoiced the Apostle's heart. The young church was indeed tried and persecuted, but thoroughly loyal to the faith and full of love for the missionaries. At the same time Paul perceived that on certain matters the church was in sore need of sound advice. Unable to go to it in person, he sent a letter, now known as 1 Thessalonians, probably the earliest of Paul's letters still extant. Though written in the name of the three missionaries (i. 1), the letter was essentially Paul's own. After the usual epistolary greeting (i. 1) the writers fervently thank God as they recall how heartily the Thessalonians had received the gospel message, and for their exemplary devotion to the gospel ever since (i. 2-10). Fearing lest their sudden departure from Thessalonica might have given rise to suspicions or even charges that they were impostors, the missionaries protest their sincerity and unselfish love, which must have been evident to all the brethren (ii. 1-12), and are thankful that their message had been received as the word of God, although persecution was the result (ii. 13-16). They are reminded how Paul had earnestly desired to revisit them but was prevented (ii. 17-20). He had therefore sent Timothy (iii. 1-5), who had just returned with a most comforting report (iii. 6-10). He prays that he may be guided to see them again and that they may be preserved perfect unto the end (iii. 11-13). The letter now becomes less personal and more didactic. The readers are reminded that they must live pure and holy lives (iv. 1-8) and abound in brotherly love (iv. 9-12). Those who had recently been bereaved and were in fear that believers who died before the Parousia would not share in its glory and blessing are comforted by the assurance that such will not be the case (iv. 13-18). The teaching is added that the Parousia, though it will come suddenly, will bring no disaster to those who are watchful and faithful (v. 1-11). After a number of brief practical exhortations the letter closes with a prayer, injunction as to its being read to all, and a benediction (v. 12-28). The whole letter doubtless reflects the general character of Tim-

othy's report of conditions at Thessalonica. But it is more than a message based on that report. It also reflects and unveils the Apostle's own state of mind as he thought of himself and his message in connection with that little company of believers, bereft of his counsel and subject to trial and persecution. The epistle is a most valuable witness to Paul's love for and devotion to his converts. The absence of doctrinal discussion incidentally reveals how comparatively simple Paul's missionary preaching was. This infant church, but a few months old, was not prepared for such deep discussions as are contained in Romans. 1 Thessalonians bears on its face so unmistakably the stamp of genuineness that it is accepted as Paul's by practically all modern scholars.

This letter, no doubt, was eagerly read by the believers at Thessalonica and its admonitions heeded. In the meantime Paul was busy with his missionary work in Corinth. During this period Paul learned, presumably through messengers from Thessalonica, that while the general condition of the church there was satisfactory, yet on some points it was in need of further instruction or admonition. In particular the expectation of the speedy second coming of Christ was causing some a great deal of anxiety, and in other cases leading to the expression of startling views. Paul's teaching on this subject was as yet only imperfectly understood. What he had said on this matter in his first letter had produced on some an effect other than that intended by the Apostle. Certain ones, perhaps those of a more excitable temperament, were asserting that the Parousia was immediately impending (cf. 2 Thess. ii. 2), even claiming (so it was told Paul) that letters from Paul contained such teaching. Such agitation led some to neglect their everyday duty (cf. 2 Thess. iii. 10) or to be less careful to maintain that high moral standard of conduct that Paul always made absolutely essential (cf. 2 Thess. iii. 6-15). On the other hand, the way Paul had emphasized (in 1 Thess. v. 1-11) the idea that the day of the Lord would take swift vengeance on all the wicked had apparently led some oversensitive souls to be discouraged and feel that they were unworthy of being included among the blessed ones destined to be "ever with the Lord" after his Parousia. Mainly, then, to reassure the timid and disheartened, to discourage unwarranted expectation as to the immediateness of the second advent, and to give helpful, practical advice, such was the purpose of Paul in writing 2 Thessalonians. The encouraging character of the extended thanksgiving section (i. 3-12), the special discussion of the Parousia (ii. 1-12), in which it is explained that first there must be a great manifestation of wickedness which is now held in restraint (by the Roman government with its insistence on law and order?), the words of encouragement in ii. 13-16, and the practical advice in iii.—all these appear perfectly natural and in order in the light of such a purpose.

The Pauline authorship of 2 Thessalonians has been seriously questioned. At present, however, the acceptance of it as Paul's has become more general. The grounds for assigning it to some post-Pauline writer which are entitled to serious consideration are in the main two: (a) the many close resemblances to 1 Thessalonians in vocabulary and style, and (b) the difference between the two letters in the treatment of the subject

of the Parousia (1 Thess. iv. 13-v. 11, compared with 2 Thess. ii. 1-12). The significance of (a) is thought to be that it indicates the work of a forger, using 1 Thessalonians as his model, while (b) is said to prove diversity of authorship. For a full discussion of these points the reader is referred to the commentaries noted below. The explanation given above of the purpose of 2 Thessalonians fully meets, it is believed, these objections.

In both letters Paul the missionary is revealed as in no other of his extant letters. The general character of his missionary preaching, his large sympathy and his patience with the faults and limitations of his converts, his high hopes for and ideal confidence in them, his anxious care for their moral and spiritual welfare, his firm insistence on morality (purity, temperance, industry, honesty, etc.), and, behind all, the Apostle's own personal consecration and faith—for all this the Epistles to the Thessalonians will ever remain among the most precious memorials of the apostolic age.

Bibliography. The earlier literature on these Epistles is amply reviewed in the larger modern commentaries and need not be cited here. Consult: the *Introductions* of Theodor Zahn (Edinburgh, 1909) and of James Moffatt (New York, 1911), and for commentaries: W. Bornemann in the *Meyer* series (6th ed., Göttingen, 1894); George Milligan (London, 1908); E. von Dobschütz in the *Meyer* series (7th ed., Göttingen, 1909), in many respects the best modern commentary on these Epistles; James Moffatt, in *Expositor's Greek Testament* (New York, 1910); J. E. Frame, in *International Critical Commentary* (ib., 1912).

THES'SALONICA (Gk. Θεσσαλονίκη). An ancient Greek city, on the northeastern shore of the Thermaic Gulf in Mygdonia. Tradition told of an early city, Eumathia or Halia, on this site, but the historical Greek city appears in Herodotus and Thucydides as Thermæ, a name due to the presence of hot springs in the neighborhood. The exact origin of the later name, which appears in Polybius, is uncertain. Most probable is the story of Strabo, that the town was enlarged and in part rebuilt in 315 B.C. by Cassander, who gave it the name of his wife, Thessalonica, the daughter of Philip of Macedon. Its strong fortifications enabled it to repel a Roman attack, and after the Roman conquest of Macedonia (146 B.C.) it became one of the chief cities of the province. Situated on the great Via Egnatia, it attracted a large trade by land and sea, while the support given to Mark Antony and Octavian seems to have made it a free city. It contained a considerable Jewish colony, and was the seat of a Christian church, founded by the Apostle Paul. It was severely punished by the Emperor Theodosius I, when 7000 citizens are said to have perished because of an uprising, but appears in the later history of the Empire as a strong defense against the Goths and Slavs. It was, however, captured by the Saracens in 904 A.D., by the Normans in 1185, and finally by the Turks in 1430. For the modern city, see SALONIKI.

THES'SALY (Lat. *Thessalia*, from Gk. Θερσαλία, Attic Θερραλία, Thettalia, Thessaly, from Θεσσαλός, Thessalos, Attic Θερραλός, Thettalos, Thessalian). The largest division of ancient Greece, separated on the north from Macedonia by the Cambunian Mountains, and on the west from Epirus by the Pindus range. The Ægean

Sea is on the east. (Map: Greece, Ancient, C 2.) Though Achæa, Ænis, and Malis can properly be included in the general term, Thessaly proper reaches only to the range which extends from Pindus to the head of the Pagasæan Gulf. Others, who include Achæa (Phthiotis), call Mount Othrys the southern boundary. Thessaly proper is a vast plain shut in on every side by mountains; on the north and the west by those already named, and on the east by mounts Pelion and Ossa, the only opening being the Vale of Tempe (q.v.) in the northeast between Ossa and Olympus. The plain of Thessaly is said at one time to have been a vast lake, the waters of which found an outlet by the Vale of Tempe. This plain is drained chiefly by the river Peneus (now Salambria) and its tributaries, and is the most fertile in all Greece; it produced in ancient times abundance of grain and cattle, and a breed of horses considered the finest in Greece, and it still yields large crops.

History. In the epic, Thessaly seems inhabited by a number of tribes, among whom are the Pelasgians of the Peneus valley, and the Achæans and Hellenes in the south. During the migrations that marked the period between the heroic age and that of historical Greece, tribes from the mountains of Epirus and the north pushed into this region, driving out or subjugating the inhabitants. Part of these latter migrated to Asia Minor, where they colonized Æolis. The Boeotians, too, were said to have been crowded out by the newcomers, but it is probable that Boeotians and Phocians were really the vanguard of the invaders. The conquerors settled in the Peneus valley, reducing the original owners to serfs of the soil, who cultivated the land on their own account, paying a fixed proportion to the owners. These Penestæ, as they were called, could not be sold out of the country nor put to death without a trial. The Thessalians themselves constituted a landed nobility gathered about the cities. In these cities a few great families exercised almost unlimited power. Of these, in the sixth and fifth centuries B.C., the most famous were the Aleuadæ of Larissa and the Scopadæ of Crannon and Pharsalus. The league between the cities was a loose one, and there was no supreme authority, except as some family obtained a leading position. Four districts were recognized from early times, Hestiaotis at the north, Thessaliotis and Pelasgiotis in the centre, and Phthiotis in the south, each of which in the fourth century was led by a polemarch. A general council seems to have met when any occasion calling for united action arose, and in war a general called the tagus (*Ταγός*) was chosen as commander in chief. The league was thus essentially military, but there must have been a well-established system, for in the sixth century B.C. the Thessalians were threatening to extend their power over southern Greece, and seem at one time to have occupied Phocis. Their strength was in their cavalry, composed of the nobles, to which were added pelasts or light infantry, composed probably of Penestæ.

The Thessalians soon brought under their rule the mountainous districts surrounding the Peneus valley, occupied by the Perrhæbians, Magnetes, and Achæans of Phthiotis, who as independent tribes had places in the Amphictyonic Council (q.v.), but later paid tribute and military service to the Thessalians. The other border tribes (Dolopians, Ænianians, and Malians)

were also in actual, if not nominal, dependence. The power of Thessaly received a check at the hands of the Phocians, and after the Persian wars it played but a small part in Greek history, until, in the fourth century B.C. for a brief period it was united under the rule of the able tyrant of Phæræ, Jason, who secured his election as tagus, collected a strong force of cavalry and mercenary infantry, organized a fleet, and at the time of his assassination (370 B.C.) seemed likely to anticipate the career of Philip of Macedon. His successors were blood-thirsty tyrants and the united Thessaly was quickly dissolved, though the old district organization was revived under the influence of Pelopidas (q.v.) and the Thebans. During the Sacred wars (q.v.) the country was at one time occupied by the Phocians, but in 352 B.C. passed under Macedonian control, and in 344 B.C. Philip was elected archon (the new name of the tagus) of Thessaly and the country was virtually united to Macedon. Thessaly remained subject to the Macedonian kings till the victory of Flamininus, at Cynoscephalæ, in 197 B.C., placed it under the protection of Rome. Under the Roman emperors Thessaly was united with Macedonia, but after Constantine it was a separate province. In 1204, with other portions of the Eastern Empire, it came under the dominion of the Venetians, and in the fourteenth century it was conquered by the Turks. The southern part of Thessaly was freed from Turkish rule at the time of the Greek Revolution. The bulk of the region was ceded to Greece in 1881 as a result of the demand of the Great Powers made on the conclusion of the Russo-Turkish War. A small mountainous district in the north still belongs to Turkey. In 1897 Thessaly was the principal seat of the Greco-Turkish War, the Turks forcing the Milouna and Raveni passes, in the Olympian range, on the frontier, and finally occupying Larissa. Thessaly comprises the nomes of Phthiotis, Larissa, Karditsa, Trikkala, and Magnesia. Consult: W. M. Leake, *Travels in Northern Greece* (4 vols., London, 1835); A. Philippson, *Thessalien und Epirus* (Berlin, 1897); R. G. Kent, *A History of Thessaly from the Earliest Historical Times to the Accession of Philip V of Macedon* (Lancaster, Pa., 1904); K. Baedeker, *Greece* (4th Eng. ed., Leipzig, 1909); Wace and Thompson, *Prehistoric Thessaly* (Cambridge, 1912).

THETFORD. A municipal and Parliamentary borough and market town in Norfolk, England, on the Little Ouse, 79 miles northeast of London (Map: England, G 4). It has an eventful history and in the reign of Edward III contained eight monasteries and twenty churches. Its most important relic of antiquity is the castle hill, a mound 1000 feet in circumference and 100 feet high, probably the largest Celtic earthwork in England. Pop., 1901, 4600; 1911, 4778.

THETFORD MINES. A town in Megantic County, Quebec, Canada, on the Quebec Central Railway, 76 miles by rail south of the city of Quebec. There are asbestos mines in the vicinity, and the town has various manufactures. Pop., 1901, 3256; 1911, 7261.

THETIS (Lat., from Gk. *Θέτις*). The most famous of the Nereids (q.v.), daughter of Nereus and the Oceanid Doris. She was loved by both Zeus and Poseidon. When Themis prophesied that her son would be mightier than his father the gods desisted from their suit and compelled her to wed Peleus

(q.v.). By Peleus she became the mother of Achilles (q.v.). In Homer she is represented as living with her father in the depths of the sea. She was said to have protected Dionysus when he fled from Lycurgus, and to have tended Hephaestus when he was hurled from heaven by Hera.

THETIS'S HAIR STONE. See **ROCK CRYSTAL**.

THEURIET, tē'rē'ā', **ANDRÉ** (1833-1907). A French poet and novelist, born in Marly-le-Roi (Seine-et-Oise). He studied law in Paris, began practice in 1857, and soon afterward accepted a position in a department of the Ministry of Finance. His interests soon had turned to literature. His favorite field is the provincial idyl of humble life. His first poems were entitled *Le chemin des bois* (1867). The human figures are bawlers of wood whose struggles the poet describes truthfully and with feeling. *Le bleu et le noir, poèmes de la vie réelle* (1876) is among his best volumes of verse. Theuriet describes Breton landscapes with charming touches. Of about sixty volumes of fiction the best are *Le mariage de Gérard* (1875; Eng. trans., 1906) and *Amour d'automne* (1888). He also wrote: *Reine des bois* (1890); *La Chanoinesse* (1893); *La sœur de lait* (1902); *Godson of a Marquis* (1906). The nearest analogue to his best fiction is the pastoral work of George Sand, but his style, marked by occasional archaisms, more nearly resembles that of Bernardin or of Rousseau. In the drama, Theuriet wrote *Jean-Marie* (1871); *La maison des deux Barbeaux* (1885); and *Jours d'été* (1901). In 1896 he was elected to the Academy.

THÉVENET, tāv'nā', **MARIUS** (1845-1910). A French politician, born in Lyons. He studied law and gained great distinction at the bar of his native city, and was elected a deputy from the Department of the Rhône in 1885. He was appointed Minister of Justice and Public Worship Feb. 22, 1889, in the second cabinet of Tirard. He displayed great activity in this position in the suppression of Boulangism, and vigorously prosecuted Paul Déroulède as chief of the League of Patriots. He was reelected deputy in 1890, lost his portfolio at the fall of the ministry, March 17, 1890, and in 1892 was elected Senator from the Department of the Rhône. He was implicated in the Panama scandal, but escaped prosecution. His militant attitude in the Dreyfus affair caused him to fail of reelection to the Senate in 1900.

THIBAUDEAU, tē'bō'dō', **ANTOINE CLAIRE**, **COUNT** (1765-1854). A French statesman and historian, born at Poitiers. At the outbreak of the French Revolution he was a lawyer in his native city. He was elected to the Convention in 1792, joined the party of the Mountain, and voted for the death of the King. In 1796 he was chosen President of the Council of Five Hundred. He abandoned his extreme views, opposed the *coup* of the 18th Fructidor (Sept. 4, 1797), and was saved from deportation by the intervention of friends. After the *coup* of the 18th Brumaire (Nov. 9, 1799) he was made Prefect of Bordeaux, and held the position of Councilor of State till 1808. In that year he became Prefect of the Department of Bouches-du-Rhône. He helped in the collaboration of the Code and was made Count of the Empire in 1809. On the second return of the Bourbons he was proscribed as a regicide and lived abroad till the revolution of 1830. He was made a Senator by

Napoleon III, and died in Paris, March 8, 1854. He wrote: *Mémoires sur la Convention et le Directoire* (1824); *Mémoires sur le Consulat* (1827); *Histoire générale de Napoléon Bonaparte* (1828); *Le Consulat et l'Empire* (1835); *Histoire des Etats Généraux et des institutions représentatives en France* (1843). His autobiography appeared in 1875.

THIBAUT, tē'bō', **JACQUES ANATOLE**. See **FRANCE, ANATOLE**.

THIBAUT, tē'bō', or **THEOBALD**, **I** (1201-53), King of Navarre from 1234 to 1253, originally Count of Champagne and Brie. He was born in France and educated at the court of Philip Augustus. He is said to have been in love with Blanche of Castile, Queen of Louis VIII, and when Louis died, in 1226, some suspected that he had been poisoned by Thibaut. The latter at first allied himself with the league of nobles against Blanche, Regent during the minority of her son, but was soon won over by her. On the death of his uncle, Sancho the Strong of Navarre, in 1234, he succeeded to that Kingdom. He went to Palestine in 1239, but was badly defeated at Gaza. He was a friend of literature and a *trouvère* of no mean order, Dante and Petrarch being among his admirers. His poems were first published by Lévesque de la Ravallière (2 vols., Paris, 1742), and have been republished several times since. Consult Ernest Lavisse, *Histoire de France*, vol. iii, part vi (Paris, 1901).

THIBAUT, **ANTON FRIEDRICH JUSTUS** (1772-1840). A German jurist. He was born at Hameln, and studied at Göttingen, Königsberg, and Kiel, at which latter university he was appointed professor of civil law in 1798. In 1802-06 he was professor at Jena, where he became a friend of Goethe and Schiller. In the latter year he went as professor of civil law to Heidelberg, where he remained until his death. He published: *Theorie der logischen Auslegung des römischen Rechts* (1799; 2d ed., 1806); *Ueber Besitz und Verjährung* (1802); *System des Pandektenrechts* (2 vols., 1803; 9th ed., 1846); *Zivilistische Abhandlungen* (1814).

THIBET, tīb'ēt or tī-bēt'. A dependency of China. See **TIBET**.

THIBODAU, tē'bō-dō'. A town and the parish seat of Lafourche Parish, La., 47 miles west by south of New Orleans, on Bayou Lafourche, and on the Texas and Pacific and Morgan's Louisiana and Texas railroads (Map: Louisiana, H 7). It derives considerable commercial importance from its situation in a fertile rice, corn, trucking, and sugar-cane region. Foundry products, ice, and canned goods are manufactured. Thibodaux College, Mount Carmel Academy, and the Guion Academy are here. Pop., 1900, 3253; 1910, 3824.

THICKET (AS. *piccet*, from *picce*, thick; connected with Ger. *dick*, Welsh, Corn. *teu*, thick, and Ger. *dicht*, Dan. *tæt*, Eng. *tight*). A plant society dominated by shrubs. In regions of great rainfall thickets may be regarded as forerunners of forests, but in many arid regions while present conditions remain they are usually the ultimate type of vegetation. Various names have been given to the xerophytic thicket areas. In the southwestern United States they are called chaparral; in the Mediterranean region, maqui; in southern South America, espinal; in Australia, scrub.

THICKHEAD FLY. Any one of the flies of the family Conopidae, a group comprising species

with large and conspicuous heads. They are rather large insects, but are generally slender and with a stalked abdomen. They frequent flowers and their larvæ are parasitic, chiefly upon bumblebees and wasps, and also more rarely upon grasshoppers. About 30 species occur in the United States.

THICK-KNEE. A large, plover-like shore bird of the Old World, representing the family *Edicnemidæ*, of which several species are known, all characterized by the enlargement of the tibiotarsal joint. The familiar one of western Europe (*Edicnemus edicnemus*) is known in Great Britain as the great or stone or Norfolk plover, or stone curlew, and is a favorite among gunners. See Plate of BUSTARDS.

THICKLEY, EAST. See SHILDON AND EAST THICKLEY.

THIÉBAUD, tyá'bô', GEORGES (1850-1915). A French publicist, born at Toulouse. He was editor of the *Courrier des Ardennes*, went to Paris in 1885, and in 1887 initiated and managed the unsuccessful campaign of General Boulanger (q.v.) for the presidency. He traveled through France to popularize the idea of digging the Panama Canal and with Barrès (q.v.) preached nationalistic ideals. He was a concise and brilliant writer as well as a gifted orator. He wrote: *Déposition devant la haute cour le seize décembre* (1889); *Le devoir national à l'Hôtel de Ville and Parlementaire et plébiscitaire* (both 1900); *Le parti protestant et le progrès protestantisme en France depuis 25 ans* (1905); *Souvenirs d'un publiciste* (1908); *Le secret du règne* (1909).

THIEF RIVER FALLS. A city and the county seat of Pennington Co., Minn., 50 miles by rail northeast of Crookston, on Red Lake and Thief rivers and on the Great Northern and the Minneapolis, St. Paul, and Sault Ste. Marie railroads (Map: Minnesota, A 2). It has a Carnegie library and a large municipal auditorium. The city is situated in a productive farming region, adapted particularly to the growing of wheat, and has large ironworks and a foundry, a flour mill, and a sash and door factory. Pop., 1900, 1819; 1910, 3714.

THIELE, tē'le, JOHANNES (1865-). A German chemist. He was born in Ratibor and was educated at Breslau and Halle (Ph.D., 1890). In 1893 he was called to Munich and in 1902 to Strassburg, where he served as rector of the university during 1910-11. The results of his many investigations were communicated to the *Berichte der Deutschen Chemischen Gesellschaft* and other chemical journals.

THIELMANN, tel'mān, JOHANN ADOLF, BARON (1765-1824). A Prussian general, born at Dresden. He entered a Saxon regiment in 1782, served through the Rhine campaigns, and fought for Prussia in the battle of Jena in 1806. He was next sent by Saxony as ambassador to Napoleon I, became his ardent admirer, and did much to bring about the Franco-Saxon Alliance. He served with the French as major in the campaign of 1807; fought at Friedland in that year, was made major general, and operated against the Austrians in Saxony. In the Russian campaign of 1812 he commanded a brigade of cavalry and for exceptional bravery in the battle of Borodino was made Baron. As commander of Torgau in the early part of 1813 he entered into communications with the allies, and on being ordered by the Saxon King to deliver the town to the French, resigned his

post and went over to the enemy. He was given command of a Saxon corps which participated in the invasion of France in 1814. He next joined the Prussian army (1815), and led the Third Army Corps at Ligny and at Wavre, contributing materially to the victory at Waterloo.

THIELT, tēlt. A town in the Province of West Flanders, Belgium, 20 miles southwest of Ghent (Map: Belgium, B 4). It has an ancient cloth hall and belfry and manufactures cotton and woolen goods, linen, leather, etc. In 1383 it was almost totally destroyed by fire, and has never regained its importance. Pop., 1900, 10,727; 1910, 11,605.

THIERRY, tyá'ré', AMÉDÉE (1797-1873). A French historian, born at Blois, brother of the following. He was associated with the Romantic school and especially with its journal, the *Globe*, and obtained a clerical post under the government in recognition of his contribution to the history of Guienne in 1825. His *Histoire des Gaulois* (1828) won for him a professorship of history at Besançon, but his teaching proved unpalatable to the reactionary government of Charles X and his course of lectures was suspended by official order. The revolution of 1830 brought to him the Prefecture of Haute-Saône, which he held till 1838, when he received the office of *Maître des requêtes*. In 1860 he was appointed Senator of the Empire. He was advanced to high office in the Legion of Honor and elected member of the Academy of Inscriptions in 1841. The most important of his books are: *Histoire de la Gaule sous l'administration romaine* (1840-47); *Histoire d'Attila* (1856); *Tableaux de l'empire romain* (1862); *Récits de l'histoire romaine* (1860-64). He wrote also *Saint-Jérôme* (1867) and *Chrysostome et Eudocie* (1873).

THIERRY, AUGUSTIN (1795-1856). A French historian, born at Blois. He studied at the college of his native town and in the Ecole Normale at Paris, and became a teacher in a provincial school. In 1814 he went to Paris, and published his first work, *De la réorganisation de la société européenne*. Adopting the views of Saint-Simon, Thierry became his assistant for three years. In 1817 he joined Comte and Dunoyer as editor of the *Censeur Européen*, for which he wrote many articles, literary, political, and historical. In 1820 he became engaged on the *Courrier Français*, in which he published his *Div lettres sur l'histoire de France*. He then turned almost exclusively to historical writing. His masterpiece, *L'Histoire de la conquête d'Angleterre par les Normands*, was first published in 1825. His *Lettres sur l'histoire* appeared in 1827. In 1835 he published his *Div ans d'études historiques*. In 1840 appeared his *Récits des temps mérovingiens*, which gained the great Gobert prize. His last publication was the *Essai sur l'histoire de la formation et de progrès du tiers-état* (1853). He edited for Guizot's *Collection des monuments inédits de l'histoire de France* the *Recueil des monuments inédits de l'histoire du tiers-état* (1849-56). He died May 22, 1856. His complete works were published in 10 volumes (1856-60). His principal works have been translated into English. Consult Valentin, *Augustin Thierry* (Paris, 1895).

THIERS, tyār. The capital of an arrondissement in the Department of Puy-de-Dôme, France, 23 miles east-northeast of Clermont-Fer-

rand (Map: France, S., H 3). It is pleasantly situated on a hillside and consists of an upper and a lower town, the latter in a nearly sunless gorge (the *Ville Noire* of George Sand's novel of that name). The eleventh-century Romanesque Gothic church of Saint-Genès contains a noteworthy tomb of the thirteenth century, and the church of Le Moutier is an interesting Romanesque structure founded in the seventh century. The town is noted for its manufactures of cutlery, buttons, paper, and playing cards. Pop., 1901, 17,625; 1911, 17,437.

THIERS, tyâr, ADOLPHE (1797-1877). A French statesman and historian, born at Marseilles, April 15, 1797. He was distinguished as a student at the lycée, and in 1815 he went to Aix to study law. There he formed a friendship with Mignet, the historian, in company with whom, after he had taken his degree as advocate (1818), he set off for Paris. Obtaining an introduction to Lafitte, he was enrolled among the contributors to the *Constitutionnel*, then the leading Liberal organ. His vigorous articles attracted attention and won him a place in the most brilliant circles of the Opposition. His *Histoire de la révolution française* (1823-27) gave him high rank as an historian. In January, 1830, he, with Mignet and Armand Carrel, established an able Opposition paper, the *National*. Thiers in this journal waged unrelenting war against the Polignac administration, whose publication of the celebrated Ordinances of July brought on the revolution of 1830. Under the new government of Louis Philippe Thiers was elected a member of the Chamber of Deputies, where he quickly made his mark as a debater, was appointed to a secretaryship in the Department of Finance, and in October, 1832, was made Minister of the Interior. During the next four years he acted as Minister of the Interior, Minister of Commerce and Public Works, and Minister of Foreign Affairs under various chiefs—Soult, Gérard, Mortier, and Broglie. His views became more conservative, and he repressed with severity the democratic uprisings against the new government. In February, 1836, he became President of the Council and Minister of Foreign Affairs, but in August retired when the King refused to approve his plan for intervention in Spain and became Opposition leader. In March, 1840, he again assumed the premiership and the Ministry of Foreign Affairs. He wished to support Mehemet Ali (q.v.) in his struggle against the Sultan, thus seeking to carry out the Napoleonic idea of a controlling influence by France in Syria and Egypt. He therefore refused to enter the alliance of Western powers formed for the preservation of the Ottoman Empire. (See QUADRUPLE ALLIANCE.) When Mehemet Ali was driven out of Syria, popular irritation in France, fostered by Thiers, was great, but Louis Philippe refused to countenance armed interference, as he had done in the Spanish matter, and accepted Thiers's resignation, October, 1840. The next five years Thiers spent in travel and in work upon his second history, *L'Histoire du consulat et de l'empire* (1845-62). After 1846 he again became active politically, and appeared frequently in the Chamber as an eloquent spokesman of the Opposition. In the revolution of 1848 his part was that of a Moderate friendly to the Republic. He was banished after the coup d'état of 1851, but in 1852 was permitted to return to Paris.

Thiers entered the Corps Législatif in 1863, and became the leader of the Liberal opposition, assailing the Imperial policies in a series of masterly speeches. He eloquently opposed the war with Prussia and predicted the defeat of France. After the collapse of the Empire he became the brains of the rehabilitation of France. He undertook diplomatic journeys to England, Russia, Austria, and Italy, on behalf of France—a self-imposed mission in which he was unsuccessful, but he acquired the gratitude of his countrymen. After the capitulation of Paris Thiers was elected to the National Assembly by 26 constituencies, and on Feb. 17, 1871, became chief of the executive power in the provisional government, and as such negotiated the treaty of peace with Germany. Upon the outbreak of the War of the Commune (q.v.) Thiers took swift and energetic measures for its suppression. On Aug. 31, 1871, the National Assembly conferred upon him the title of President of the Republic, making his term of office three years. Thiers, contrary to the expectations of the monarchical parties, became convinced of the need of a republican form of government, and in November, 1872, sent to the National Assembly a message urging the necessity of formulating an organic instrument of government for the Republic. The Clericals and Monarchists thereupon decided upon his fall, and, as the result of a vote of censure passed on the ministry, Thiers resigned May 24, 1873. He retired from public life for some time, but in 1876 was elected from Paris to the Chamber of Deputies, exercising his influence to the last in the defense of the Republic against Monarchist plots.

Thiers was perhaps the most influential political leader France has produced. His figure was small, his appearance far from impressive, and his early attempts at oratory are said to have been ridiculous, but when he adopted the rapid, incisive style adapted to his personality he became a most effective speaker. His course as a statesman was guided by an intense love of country, bordering on Chauvinism, and the conviction that the political power should repose in the hands of the middle class whose interests and tastes he so well represented. His histories are merely brilliant eulogies of the Revolutionary and Napoleonic ideals. He was elected a member of the Academy in 1834. His *Notes et souvenirs* were published in Paris in 1907.

Thiers," in *Histoire de la troisième république*, vol. i (ib., 1896); G. Hanotaux, *Le gouvernement de M. Thiers* (ib., 1903); E. de Marcère, *L'Assemblée nationale de 1871* (ib., 1904); C. Belot, *Le pouvoir exécutif sous le gouvernement de M. Thiers* (Dijon, 1908); P. F. Simon, *Adolphe Thiers: chef du pouvoir exécutif et président de la République Française* (Paris, 1911), containing a bibliography.

THIERSCH, tersh, FRIEDRICH (1784-1860). A German classical scholar, born at Kirchscheldungen, and educated at Leipzig and Göttingen. In 1809 he was appointed professor in

the newly established Gymnasium in Munich, where he became the founder of philological studies in Bavaria. The Philological Institute established by him was joined to the University of Munich in 1826. As a result of his sojourn in Greece, in 1831-32, he published his important work *De l'état actuel de la Grèce, etc.* (1833). He was a prime mover in establishing in 1837 regular meetings of German philologists and teachers. In 1848 he became president of the Bavarian Academy of Sciences. His writings include: *Griechische Grammatik* (3d ed., 1828); *Pindar* (1820); *Ueber die Epochen der bildenden Kunst unter den Griechen* (2d ed., 1829); *Allgemeine Aesthetik in akademischen Lehrvorträgen* (1846); and many works on education. Consult his biography by his son Heinrich (Leipzig, 1866); J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

THIERSCH, KARL (1822-95). A German surgeon, born at Munich, the son of the philologist Friedrich Thiersch (1784-1860). He studied in Munich, Berlin, Vienna, and Paris, and was a pupil of Stromeyer (q.v.). In 1854 he became professor of surgery at Erlangen and in 1867 at Leipzig. In the Franco-German War of 1870-71 he served as consulting surgeon. Thiersch is known through his work in skin grafting and in epithelial cancer. Moreover, he was one of the first continental surgeons to accept the teachings of Lister, and with others he introduced salicylic acid in the treatment of wounds. Among his works is *Der Epithelialkrebs namentlich der Haut* (1865).

THIERSCH, LUDWIG (1825-1909). A German decorative and historical painter. He was born in Munich and studied at the Munich Academy. After visiting Rome he was for three years professor at the Industrial Art School at Athens, where he was engaged by the Russian government to fresco the church of St. Nicodemus. He received similar commissions for the Greek church in Vienna, the chapels of the Grand Dukes Nicholas and Michael, and the Protestant church of St. Catharine at St. Petersburg (1860-64) and for the Greek churches in Karlsruhe (1864), London (1880), and Paris (1892).

THIES PROCESS. See CHLORINATION.

THIETMAR, tēt'mār, Bishop of Merseburg (975 or 976-1018). A German chronicler of aristocratic family, related to the Emperor Henry II. Thietmar was educated in the cloister schools at Quedlinburg and Magdeburg, was created in 1002 Provost of Walbeck, shared in the campaign of 1007 against Boleslav of Poland, and in 1009 was made Bishop of Merseburg. He passed the remainder of his life for the greater part at court and sharing in campaigns against the Slavs. His *Chronicon* covers in eight books the period from Henry I (the Fowler) to 1018, and the last three books are almost a diary. It is rough and inflated in diction, credulous in narration, but shows an earnest search for truth, and is the principal source of history for the Trans-Elbian Slavic districts during the period it covers. The best edition of the *Chronicon* is by Kurtz in *Scriptores Rerum Germanicarum* (Hanover, 1889), in the *Monumenta Germaniae Historica*. It was translated by Laurent (Berlin, 1848, and Leipzig, 1892). Consult Kurze, *Bischof Thietmar von Merseburg und seine Chronik* (Halle, 1890).

THIGH. The portion of the lower extremity which extends from the hip to the knee. The

muscles of the front of the thigh are tensor fasciae femoris, sartorius, and quadriceps extensor, the last of which is a powerful group of four muscles (rectus, crureus, and the two vasti) which are inserted below into the patella, or kneecap, and whose action is to strengthen the knee, thus being a most important factor in the preservation of the erect position and in locomotion. The muscles of the back of the thigh are biceps, semitendinosus, and semimembranosus, also called the hamstring muscles. Their action is to flex the leg on the thigh, to support the pelvis upon the head of the femur, or thigh bone, and to draw the trunk backward. On the inner side of each thigh is a group of adductor muscles, whose action is to bring the knees together. There is but one bone in the thigh, the femur, which articulates with the pelvis above and with the tibia below. The most important structures of the thigh lie in the triangle of Scarpa (q.v.). This is bounded above by Poupart's ligament, which is the base of the triangle, internally by adductor longus, and externally by sartorius. The great femoral artery and vein pass through the triangle, dividing it into nearly equal parts, the artery giving off here the profunda femoris and the vein receiving the long saphenous. The anterior crural nerve lies to the outer side of the artery. Femoral hernia appears in Scarpa's triangle, and not infrequently the extremity of a fistula running from Pott's disease of the spine appears in this space.

THIGMOTAXIS. See TROPISM, *Stereotropism*.

THIGMOTROPISM, or HAPTOTROPISM (from Gk. *thygma*, *thigma*, anything touched + *τροπή*, *trope*, a turning, from *trepeiv*, *trepein*, to turn). The sensitiveness of organisms to stimuli by contact, especially to prolonged contact with solid substances. The responses in plants depend chiefly upon a modification of the growth of the organs concerned. It is especially marked in tendrils. Other examples are to be found in the similar curvatures of the petioles of leaf climbers, and in the stems of dodder. See GROWTH; TROPISM, *Stereotropism*.

THILLY, FRANK (1865-). An American educator, born in Cincinnati, Ohio. He graduated at the university of his native city in 1887 and then studied at Berlin and at Heidelberg. He was professor of philosophy at the University of Missouri (1893-1904), of psychology at Princeton (1904-06), of philosophy at Cornell (from 1906), where he also became dean of the Arts College. He was editor of the *International Journal of Ethics* (from 1909) and president of the American Philosophical Association (1912). His publications include: *Leibnitz's Controversy with Locke* (1891); *Introduction to Ethics* (1900); *Process of Inductive Inference* (1904); *A History of Philosophy* (1914); and translations of Weber's *History of Philosophy* (1896) and Paulsen's *Introduction to Philosophy* (1885) and *System of Ethics* (1899). He contributed to the NEW INTERNATIONAL YEAR BOOK.

THIOALCOHOLS. See MERCAPTANS.

THIOCYANIC ACID. See SULPHOCYANIC ACID.

THIONVILLE, tē'ōn'vêl'. See DIEDENHOFEN.

THIOSINAMINE, thi'ō-sin-ām'in or -ên. A substance prepared by heating together oil of mustard 3 parts, alcohol 3 parts, and ammonia

6 parts, and known chemically as allyl-sulphocarbamide. It occurs as colorless crystals, soluble in alcohol and ether and to some extent in water, with a bitter-sweetish taste, and a faint odor of garlic. Its main use in medicine is in the removal of scar tissue wherever found. Thus it is indicated in corneal opacities, keloid, deafness due to thickening of the tympanic membrane or fixation of the ossicles. Where possible it is best given by hypodermic injection, but it is also said to be moderately efficient when given by mouth or applied locally in solution. Combined with sodium salicylate it is believed to act more satisfactorily and to give less pain when injected.

THIOSULPHURIC ACID (from Gk. *θειον*, *theon*, sulphur + Eng. *sulphuric*), $\text{H}_2\text{S}_2\text{O}_3$, less properly hyposulphurous acid. An acid compound unknown in the isolated state and but little known in the form of dilute aqueous solutions, but well known in the form of its salts, called thiosulphates (or hyposulphites), especially its sodium salt. The thiosulphates are formed by the action of metals (such as zinc, iron, etc.) on acid sulphites. The thiosulphates of the alkalies are freely soluble in water; those of the alkaline earths are much less soluble; while those of the heavy metals are by themselves insoluble, but generally form soluble double compounds with the thiosulphates of the alkalies. The thiosulphate of sodium may be prepared in the laboratory by boiling a solution of sodium sulphite with sulphur. It may also be made from the thiosulphate of calcium. The latter is produced by the action of sulphur on lime. Hence it is produced (along with calcium pentasulphide) when lime is used for the purification of illuminating gas. Further, it is formed when a solution of calcium pentasulphide is exposed to the oxidizing action of the air—a reaction causing the production of the thiosulphate in the manufacture of soda (q.v.) and its increased production in the purification of illuminating gas. Aqueous sodium thiosulphate has the remarkable property of dissolving the halogen salts of silver, mercurous chloride (calomel) and iodide, the iodide and the sulphate of lead, the sulphate of calcium, and the oxides of copper. Owing to its capacity for dissolving the halogen salts of silver unaltered by light, it is extensively used in photography. It is further employed in the manufacture of certain coal-tar colors and in dyeing.

THIRD. See INTERVAL.

THIRD ESTATE (Fr. *tiers état*). See FRANCE; FRENCH REVOLUTION; STATES-GENERAL.

THIRLWALL, NEWELL CONNOP (1797–1875). An English historian and bishop, born in London. He studied at Charterhouse School and graduated at Trinity College, Cambridge, in 1818. In 1820 he entered Lincoln's Inn and was called to the bar in 1825, but this profession was distasteful and he spent the years until 1828 in travel and literary pursuits, publishing translations of tales from Tieck and Schleiermacher's *Critical Essay on the Gospel of St. Luke* (1825). In 1827 he took up his residence in Cambridge, and until 1834 held various offices in the university when he was called upon to resign his appointment as assistant tutor on account of a pamphlet, *Letter on the Admission of Dissenters to Academic Degrees*. He accepted a living at Kirby Underdale in Yorkshire, where he wrote his *History of Greece* (1835–44). In 1840 he was appointed Bishop

at St. David's in Wales; in 1874 he resigned his see and retired to Bath, where he died. With J. C. Hare he translated *Niebuhr's History of Rome* (1828–32). His *Remains, Literary and Theological*, and *Essays, Speeches, and Sermons* were edited by J. J. S. Perowne (London, 1877–80); his *Letters to a Friend*, with a memorial sermon, was edited by Dean Stanley (ib., 1882), and his *Letters, Literary and Theological*, with a *Memoir*, by Perowne and Stokes (ib., 1881).

THIRST (AS. *þurst*, *þyrst*, Ger. *Durst*, thirst; connected with Lat. *torrere*, to parch, Gk. *ῥέσθαι*, *tersesthai*, to become dry). A sensation normally due to a lack of water in the tissues of the body. Although the sensation of thirst is referred principally to the mouth and throat, it is not a purely local feeling and can be satisfied by the introduction of fluid into the circulation through various channels. Water may be absorbed and thirst relieved by transfusion of saline solution into the veins, by injection into the tissues (hypodermoclysis), and to a less extent by absorption from the skin, as well as by drinking. In a state of thirst, the body fluids become reduced in volume, and of higher specific gravity and more saline, and these conditions explain the craving for water. Thirst is occasioned physiologically by profuse perspiration from exercise—especially in a warm, dry atmosphere—by a highly seasoned diet, by smoking, or by salty food. Many morbid conditions give rise to thirst; it is always an accompaniment of fevers and inflammations; diseases which, like cholera asiatica, diabetes, and diarrhoea, are characterized by great loss of fluid from the body, are thirst-producing. Loss of blood brings on a craving for liquids. As an exception to the rule that fevers demand drink, it may be noted that in typhoid fever thirst is sometimes blunted or suppressed. Thirst is most effectively relieved by slightly acidulated drinks, these provoking an outflow of saliva.

THIRTY-NINE ARTICLES OF RELIGION, THE. See ARTICLES, THE THIRTY-NINE.

THIRTY TYRANTS. 1. A body of rulers in Athens, invested with sovereign power after the close of the Peloponnesian War, 404 B.C. They were all native Athenians, chosen by the Spartan conquerors, who, knowing the animosity existing between the democracy and the oligarchy of Athens, hoped to rule the city through the agency of the latter. One of the most unscrupulous members of the body was Critias (q.v.), while Theramenes (q.v.) headed the moderate division. Their rule, after a year, was overthrown by Thrasybulus (q.v.). 2. The petty usurpers who sprang up during the reign of the Roman emperors Valerian and Gallienus (q.v.) (254–268 A.D.). They endeavored to establish themselves as independent princes. In reality, historians can only reckon 19—Cyriades, Macrianus, Balista, Odenathus, and Zenobia, in the East; Postumus, Lollianus, Victorinus (with his mother, Victoria), Marius, and Tetricus, in the West; Ingenuus, Regillianus (more properly Regalianus, as the name appears on coins), and Aureolus, in Illyricum and the countries about the Danube; Saturninus, in Pontus; Trebellianus, in Isauria; Piso, in Thessaly; Valens, in Achæa; Æmilianus, in Egypt; and Celsus, in Africa.

THIRTY YEARS' WAR. The name given to the great European struggle (1618–48) which marked the climax of the Reformation (q.v.),

closing the period of distinctively religious politics and opening that in which secular statecraft replaced it. The Religious Peace of Augsburg (1555) afforded no permanent settlement of the questions stirred up by the Protestant revolution. Its terms recognized only Lutherans and Catholics; meanwhile the Calvinists had grown strong, and, unfortunately for the Protestant cause, violent enmity existed between them and the Lutherans. The relations of the Emperor and the German princes were ill-defined, and little real adjustment had been reached. France had already separated her natural interests from the affiliations of religion and aided the German Protestant princes in their insubordination towards their Imperial Catholic head. The Reformation, by overthrowing the idea of Christ's unity in the Church, broke down the theory of a Holy Roman Empire and put forward in its place the Germanic idea of autonomy for individual states. In the turmoil of sixteenth-century Europe it was inevitable that the solvent for these and other issues should be found in a general war. The outbreak came in an unexpected way. The liberal reign of Maximilian II (1564-76) was favorable to the growth of Protestantism in the Austrian dominions. His successor, Rudolph II (1576-1612), brought in the reactionary Jesuit influence and allowed full play to the forces of the Counter Reformation. Open interference with the practice of the Protestant religion was permitted and numbers of Protestant churches were destroyed. In 1607 Maximilian I, the Catholic Duke of Bavaria, made himself master of the free Imperial city of Donauwörth, whose inhabitants were mainly Protestants. A number of Protestant princes and cities founded in 1608 the Evangelical Union for the defense of their interests and their faith, and this was met by the formation of the Catholic League under the leadership of Maximilian of Bavaria in 1609. In that year the Emperor was forced to publish his *Majestätsbrief*, by which the Protestants of Bohemia were guaranteed free exercise of their religion. At this time the political state of the Empire was further unsettled by the Jülich-Cleves war of succession. (See JÜLICH.) In 1612 the Emperor Rudolph II died and was succeeded by his brother Matthias, to whom the Archduchy of Austria, Moravia, Hungary, and Bohemia had previously been transferred as a result of Rudolph's reckless rule. In 1617 the Bohemian estates were called upon to crown, as their prospective King, Duke Ferdinand of Styria, the Hapsburg heir presumptive, in accordance with a custom which had become established. Ferdinand had made himself prominent by the relentless manner in which he had rooted out Protestantism in his paternal Styrian dominions. His attitude encouraged the Catholic church in Bohemia in its aggressions, and soon a dispute regarding the interpretation of the *Majestätsbrief* brought on open conflict. On May 23, 1618, a body of Protestants, led by Count Thurn, entered the royal palace of Prague, and hurled two odious representatives of the crown, Martinitz and Slavata, from its windows. This defenestration, the victims escaping with their lives, inaugurated a struggle which was to convulse Europe for 30 years.

The Bohemians rose under Thurn, and the insurrection spread into adjoining Hapsburg dominions. A body of troops of the Union,

under Count Mansfeld, appeared, and Bethlen Gábor, Prince of Transylvania, prepared to make war on Austria. Matthias was unprepared to meet the onslaught. Spain came to his aid, but the Spanish force was too weak to stay the advance of the enemy. The Emperor died in March, 1619, and Ferdinand, succeeding as the head of the house of Hapsburg, found himself beleaguered in Vienna by the victorious Thurn. Through firmness he succeeded in averting the fall of his capital, and made his way to Frankfurt, where he was elected Holy Roman Emperor as Ferdinand II (August, 1619). The Bohemians, having declared their throne vacant, crowned the Elector Palatine Frederick V, the son-in-law of James I of England. Ferdinand, whose capital was in the meanwhile again threatened, this time by the Prince of Transylvania, was enabled to attack Frederick by means of the forces of the Catholic League, whose leader, Maximilian of Bavaria, was offered a rich indemnity. John George, Lutheran Elector of Saxony, eager for territorial acquisitions, entered the field against the Bohemians, while the Spaniards invaded the Lower Palatinate. The Protestant Union dared not move, and James I kept aloof from Frederick. On Nov. 8, 1620, a battle was fought at the White Hill, before the walls of Prague, in which the army of the League, under Tilly, was completely victorious. Frederick fled from Bohemia, which was chastised in a fearful manner by the Emperor, and forced back into the fold of the Catholic church. The dissolution of the Evangelical Union ensued. The cause of the Elector Palatine, however, whose hereditary dominions, the Upper and the Lower Palatinate, were assailed, found intrepid champions in Mansfeld and Christian of Brunswick, lawless partisan leaders. George Frederick, Margrave of Baden-Durlach, also took up arms for Frederick, and with Mansfeld gained a victory over Tilly at Wiesloch on April 27, 1622. On May 6, however, the former was vanquished by Tilly at Wimpfen; June 20 a like disaster befell Christian of Brunswick at Höchst. On Aug. 6, 1623, Christian of Brunswick sustained a second defeat by Tilly at Stadtlohn. Frederick was stripped of his possessions. The Upper Palatinate and the electoral dignity were conferred on Maximilian of Bavaria.

The war might have ended with this local struggle, but the outrageous treatment to which the Protestant states of north Germany were subjected pressed the conflict on to its second phase. Christian IV of Denmark, aided by a British subsidy, went to the aid of his German coreligionists in 1625, and, being joined by Mansfeld and Christian of Brunswick, advanced into Lower Saxony, while the Emperor, hampered by the political jealousy of the Catholic League, was at first unable to oppose him. It was at this juncture that Wallenstein came forward and placed a great army, raised by himself, at the disposal of Ferdinand. This army acted in coöperation with that of the Catholic League under Tilly. Mansfeld was completely defeated by Wallenstein at Dessau (April 25, 1626), and the forces of Christian IV were routed by Tilly at Lutter (Aug. 27, 1626). Wallenstein marched as far as Hungary in pursuit of Mansfeld, who died in November, 1626. The combined Imperialists and Leaguers overran north Germany and Wallenstein penetrated into the

heart of Denmark. The Imperialist commander conceived the design of making Austria a power on the Baltic, but his career in this direction was checked by the heroic defense of Stralsund (1628). King Christian was forced to conclude the humiliating peace of Lübeck (May 12, 1629). Inflamed by success, Ferdinand had, on March 6, 1629, issued the Edict of Restitution, by which the Protestant titles to all ecclesiastical lands acquired after 1552 were declared void. Thus closed the second period of the war, with the Protestant States infuriated by the edict and the proud city of Magdeburg alone in arms to resist its execution.

Richelieu (q.v.), developing the anti-Hapsburg policy of Henry IV, had promoted, as far as the internal affairs of France would allow, dissension in Germany. He now succeeded in bringing into the struggle the able and ambitious Protestant King of Sweden, Gustavus Adolphus (q.v.). This ruler, desirous of promoting Protestantism and of securing control of the Baltic, took the field, and the Swedish phase of the war began with the landing of the Swedes on the coast of Pomerania in the summer of 1630. Just at this time the princes of the Catholic League, exasperated by the overbearing conduct of Wallenstein and the excesses of his soldiery, forced the Emperor to dismiss him, Tilly being made commander in chief of the Catholic forces. Gustavus Adolphus, who in January, 1631, entered into a subsidiary alliance with France, advanced southward into Germany. The electors of Saxony and Brandenburg at first remained neutral, but finally were forced to join him. The obstacles in his path delayed him until it was too late to rescue Magdeburg, which on May 20, 1631, was stormed by Tilly and Pappenheim, whose troops burned the town and massacred the inhabitants. On Sept. 17 (O.S., Sept. 7), 1631, the Swedish King, strengthened by the Saxon army under Arnim, overwhelmed Tilly at Breitenfeld, near Leipzig, a victory which completely restored the Protestant cause. He then victoriously traversed the Main and Rhine valleys; forced the passage of the Lech in front of the army of Tilly, who was mortally wounded (April 15, 1632); entered Munich, and threatened the Hapsburg dominions. Wallenstein, meanwhile, had been recalled to raise and command the Imperialist armies to meet this formidable enemy. He compelled the Swedes by skillful strategy to return to Saxony. There the Swedes won the battle of Lützen (q.v.), Nov. 16 (O.S., Nov. 6), 1632, after an obstinate engagement in which Gustavus was killed. His death was a severe blow to the Protestant cause, but the energy and ability of the Swedish Chancellor, Oxenstierna (q.v.), and the brilliant talents of the Swedish generals, preserved the advantages that had been gained. After the battle of Lützen Wallenstein remained long inactive, engaging in endless negotiations. Bernhard (q.v.) of Saxe-Weimar, one of the ablest of the Protestant leaders, overran Bavaria, and on Nov. 14, 1633, stormed Ratisbon. The behavior of Wallenstein, after a display of activity, inaugurated by a victory over the Swedes at Steinau, Oct. 13, 1633, finally left no doubt in the mind of Ferdinand II that his general was meditating treason. He was deposed from his command and was assassinated at Eger in Bohemia, on Feb. 25, 1634. His virtual successor, Gallas, inflicted a crushing defeat on Bernhard of Weimar and

the Swedish general, Horn, at Nördlingen (Sept. 6, 1634), which again restored to the Emperor a preponderating influence in Germany. Saxony now made peace at Prague (May 30, 1635), the Elector securing important territorial gains. Other Lutheran states withdrew from the conflict, the Calvinists being left to their fate.

Final success now appeared to demand only one more strenuous effort on the part of Austria; but Oxenstierna was determined to preserve to Sweden her German acquisitions, and Richelieu saw that the time had come for France to throw herself into an active struggle against both Austria and Spain. The conflict advanced into its final and most extended phase. At first the Hapsburg side was enabled to make a show of strength, France being invaded by a combined force of Spaniards, Imperialists, and Lotharingians, but with such commanders on their side as Bernhard of Weimar and the Swedish general Banér, the tide soon set strongly in favor of the Protestants. The victory of Banér over the Imperialists and Saxons at Wittstock (Oct. 4, 1636) restored to Sweden the advantage lost two years before. Bernhard of Weimar, in the pay of France, fought with energy and success, ambitious to found a state for himself. In 1638 he won a victory at Rheinfelden and reduced the fortress of Breisach, but in the following year he met untimely death. In February, 1637, Emperor Ferdinand II died and was succeeded by his son, Ferdinand III. After the death of Banér in 1641, the Swedish arms were led to fresh triumphs by Torstenson, a general famous for the rapidity of movement. He defeated the Archduke Leopold William and Piccolomini at Breitenfeld Nov. 2, 1642; in 1644 he overran Denmark, whose ruler, Christian IV, had been induced to take up arms against Sweden; in the same year he defeated Gallas at Jüterbock; and on Mar. 6, 1645, he won a great victory over the Imperialists, under Hatzfeld, at Jankau, southern Bohemia. His repeated invasions carried devastation and ruin into the territories, even to the gates of Vienna, until the Austrians hardly dared appear north of the Danube. Meanwhile, in the west and south, the French were waging war with varying success. In January, 1642, they were successful at Kempen, near Düsseldorf, and in May, 1643, the Duke d'Enghien (the future Condé) won a signal victory over the Spaniards at Rocroi, but on Nov. 24, 1643, the French-Weimar forces suffered a great defeat at Tuttlingen, in Swabia, at the hands of Johann von Werth and Mercy. Condé and Turenne restored the fortunes of the French by a victory at Allersheim, near Nördlingen, Aug. 3, 1645. The Emperor was now deserted by all his allies except the Duke of Bavaria, whose territories were already mostly in the hands of Turenne and the Swedish general Wrangel; and a combined invasion of Austria from the west and north was on the point of being executed, when the diplomatic representatives of the different governments, who had been at work for seven years at Münster, in Westphalia, and at Osnabrück, agreed upon terms of peace which closed the struggle. See WESTPHALIA, PEACE OF.

Aside from the political disintegration of Germany which resulted, the 30 years' struggle had brought desolation upon the country. Scarcely any part of the Empire had escaped the horrors of the conflict, the people had been made the victims of a licentious soldiery whose

excesses long remained in popular memory. Whole regions were laid waste, prosperous towns wiped out, commerce and industry destroyed. Germany lost half of her population and two-thirds of her wealth; in Bohemia, the decrease in population rose to two-thirds or more. Religion and morality sank to a low ebb, and the loss entailed on the intellectual side was one which it took generations to make good.

F. von Schiller, *History of the Thirty Years' War in Germany* (Sterling ed., Boston, 1910). Consult also references under GUSTAVUS ADOLPHUS; RICHELIEU; WALLENSTEIN; ETC.

THISBE. See PYRAMUS AND THISBE.

THISTLE (AS. *pistel*, OHG. *distula*, *distil*, Ger. *Distel*, thistle). A popular name for various plants of the family Compositæ. They usually have stout, spiny-tipped herbage or flowering bracts. They are widely distributed, mostly as weeds. In the United States the name applies to the species of *Cnicus*, *Cirsium*, *Carduus*, *Onopordon*, *Silybum*, *Centaurea*, and *Sonchus*. By some botanists the first two genera are combined under the name *Cnicus*. The principal distinction between these two is that *Cirsium* has plumose pappus and hence is often called plume thistle, while *Cnicus* has bristly pappus. The species belonging to the other genera are all introduced from the Old World. The pasture thistle (*Cirsium pumilum*), yellow thistle (*Cirsium spinosissimum*), bull thistle (*Cirsium lanceolatum*), and others are common and troublesome in pastures and on roadsides. *Cirsium arvensis*, the so-called Canada thistle, a European species, is one of the most troublesome and difficult to eradicate of all. It is a slender perennial, 1 to 3 feet high, with rather small, rose-colored flowers. It spreads principally by its spreading rootstocks, but can be eradicated by persistent cultivation. The heads are imperfectly dioecious and not all produce seed. Among the other common European thistles found in the United States is the milk thistle (*Silybum marianum*), a biennial plant 4 to 6 feet tall. The leaves are sometimes used as salads, or as potherbs. The roots, for which it was formerly cultivated, were used like salsify. The blessed thistle (*Cnicus benedictus*), native of Asia, was formerly considered to have medicinal properties. It resembles the star thistle (*Centaurea*), of which there are many species, the best known of which are *Centaurea calcitrapa* and *Centaurea cyanus*, the blue-bottle or bachelor's button. The cotton or Scotch thistle (*Onopordon acanthium*) is recognized by its deeply honeycombed receptacle and cottony or woolly leaves. It is said to be the emblem of Scotland, but *Cirsium acaulis*, a stemless thistle common in Scotland, seems more worthy this designation. The Carline thistle (*Carlina vulgaris*) is a rather troublesome weed in poor soils in Europe, and was named Carline thistle because Charlemagne, according to tradition, used its roots as a cure for the plague. Species of *Sonchus* are called sow thistle, of which three are found in the United States, *Sonchus oleraceus*, the common sow thistle, *Sonchus asper*, the

spiny leaved sow thistle, and *Sonchus arvensis*, the field sow thistle. Other plants of different families are sometimes called thistles, as species of *Dipsacus* (see TEASEL) and blue thistle (*Echium vulgare*), the latter belonging to the family Boraginaceæ. See PLATE of TANSY, ETC.

The so-called Russian thistle is *Salsola tragus*, a plant related to the saltwort. It was introduced into America some years ago in flax seed, and was for a time a very troublesome weed in the western United States. Its name thistle came from the spiny leaves and stems.

THISTLE. A steel yacht built in 1887 at Glasgow. She lost the contest for the America's cup to the *Volunteer*, and afterward became the property of the German Emperor under the name of *Meteor*. See YACHTING.

THISTLE, ORDER OF THE; less commonly ORDER OF SAINT ANDREW. A Scottish order having the year 787 as the mythical date of its foundation. It was established by James V in 1540, reorganized by James II of Great Britain in 1687, and a second time reconstituted by Queen Anne in 1703. The statute of 1827 limits the number of knights to 16 members of the Scottish nobility, in addition to the sovereign and princes of the blood. The star of the order is of silver with a round gold plaque bearing a thistle on a green field. The ribbon is green. The motto runs, *Nemo me impune lacessit*.

THISTLE BIRD. See GOLDFINCH, 2.

THISTLEWOOD CONSPIRACY, or CATO STREET CONSPIRACY. A plot against the British government formed in 1819-20 by Arthur Thistlewood (1770-1820). It was planned to murder the Ministers at a dinner given by Lord Harrowby on Feb. 23, 1820, to seize the Mansion House, attack the Bank of England, and to set fire to London in several quarters. All of Thistlewood's intentions were, however, regularly reported to the authorities by one of his confidants, George Edwards. On Feb. 21, 1820, the conspirators hired a loft in Cato Street, and there they were arrested on February 23. Thistlewood escaped, but was captured the following day. He was found guilty on April 19, and hanged with four other conspirators.

THLINKITS, thlinkits. See ALASKA, Population.

THNETOPSYCHITES. See INTERMEDIATE STATE.

THO'AS (Lat., from Gk. *Θέας*). 1. The son of Dionysus and Ariadne. He was King of Lemnos and father of Hypsipyle (q.v.), who saved him when the men of the island were killed by the Lemnian women. 2. A King of Tauris. Artemis carried Iphigenia (q.v.) into his dominion after saving her from the sacrifice at Aulis.

THO'BURN, JAMES MILLS (1836-1922). An American Methodist Episcopal missionary bishop. He was born at St. Clairsville, Ohio, graduated at Allegheny College (1857), and was admitted to the Pittsburgh Conference (1858). From 1859 to 1908 (except for the years 1886-88) he was a missionary in India, becoming presiding elder of the Indian Conference, and for the last 20 years of the period being missionary Bishop of India and Malaysia. He published: *My Missionary Apprenticeship* (1887); *Missionary Addresses Before Theological Schools* (1887); *India and Malaysia* (1893); *Christless Nations: Graves Lectures at Syracuse University* (1895); *Light in the East* (1898); *The Christian Conquest of India* (1906); *India and*

Southern Asia (1907). Consult W. H. Crawford, *Thoburn and India* (New York, 1909).

THOLEN, tō'len. An island belonging to the Province of Zealand, Netherlands, 22 miles north by west of Antwerp (Map: Netherlands, C 3). It covers an area of about 47 square miles. The little town of Tholen is in the eastern part. Pop., 1899, 3076; 1909, 3254.

THOLUCK, tō'luk, FRIEDRICH AUGUST GOTTFREU (1799-1877). A German theologian, born in Breslau. He became professor extraordinary of theology at Berlin in 1823, and full professor at Halle in 1826, where he spent the remainder of his life with the exception of a sojourn in Rome in 1828-29. Tholuck was an influential preacher, writer, and teacher on behalf of a religion of experience. His most important work was exegetical. His commentaries on the Psalms, the Sermon on the Mount, John, Romans, Hebrews, have all been translated into English. His best-known works are *Die wahre Weihe des Zweiflers* (1823; 9th ed., 1870; Eng. trans., *Guido and Julius*, 1854); *Das Alte Testament im Neuen* (1836; 7th ed., 1877); and *Stunden christlicher Andacht* (1840; Eng. trans., *Hours of Christian Devotion*, New York, 1875). Among his other works may be mentioned *Lebenszeugen der lutherischen Kirche vor und während der Zeit des dreissigjährigen Krieges* (1859) and *Geschichte des Rationalismus* (1st part, 1865). Consult his *Life* by L. Witte (Bielefeld, 1884-86), and M. Kähler, *August Tholucks Gedächtnis* (Leipzig, 1899). His collected works were published at Gotha (11 vols., 1863-72).

THOM, tōm, JOHN HAMILTON (1808-94). A Unitarian clergyman and author, born at Newry, County Down, Ireland, where his father was settled as a Presbyterian minister. He studied at the Belfast Academical Institution with a view to the Presbyterian ministry, but he was won over to Unitarianism by the writings of William Ellery Channing (q.v.). From 1831-54 and from 1857-66 he was minister of Renshaw Street Chapel, Liverpool. From 1854 to 1857 his place was taken by William Henry Channing (q.v.). Meanwhile (1838) he became editor of the *Christian Teacher* (afterward the *Prospective Review*). In company with Martineau he conducted a famous controversy with Anglican divines on the interpretation of the New Testament (1839). Besides a *life* (1845) of Joseph Blanco White, Thom published mainly *St. Paul's Epistles to the Corinthians* (1861); *Letters, Embracing his Life, by John James Tayler* (1872); *Laurels of Life after the Mind of Christ* (1883). After his death appeared *A Spiritual Faith* (1895).

THOMA, tō'mā, HANS (1839-). A German painter, illustrator, and lithographer. With Feuerbach, Marées, and Böcklin, he became one of the leaders of modern painting in Germany. He was born at Bernau, in the Black Forest, and studied at the Karlsruhe Academy with Schirmer, at Düsseldorf (1867), and then in Paris, where he came under the influence of Courbet. Afterward he spent four years in Munich with Victor Müller, who also exerted a powerful influence upon him. His style, however, was formed chiefly on the old German wood engravers. After a visit to Italy he settled in Frankfurt, and in 1899 removed to Karlsruhe, where he was appointed director of the gallery and professor at the Academy. His intense individuality and sometimes defec-

tive technique at first blinded the public to the freshness and richness of his color, the power and poetry of his imagination, and the depth of his sympathy with German life, but after the Collective Exhibition of German art at Munich in 1890 his true value began to be appreciated. His paintings cover a wide range—landscapes, portraits, genre scenes of German life, religious, mythological, allegorical, and purely fantastic subjects. He also did some work in lithography, etching, and illustration. His lithographs are strong, simple, and full of decorative value. His best-known paintings include: "A Spring Idyl" and "The Guardian of the Valley" (Dresden Gallery); "Solitude" (Munich Pinakothek); "On the Way to the Castle of the Grail" (Vienna Gallery); "At Lake Garda" (Metropolitan Museum, New York); "Longing" (1900); "Paradise" (1901); "Scenes from the Life of Christ" (1907-08, Karlsruhe Gallery). Consult: Fritz von Ostini, "Thoma," in *Künstler-Monographien*, vol. xlv (Bielefeld, 1900); Franz Servaes, *Hans Thoma* (Berlin, 1900); M. Spanier, *Hans Thoma und seine Kunst* (Leipzig, 1903); and Henry Thode, in *Der Ring des Frangipani* (4th ed., Frankfurt, 1909).

THOMA, LUDWIG (1867-1921). A German journalist and author, who used the pseudonym of Peter Schlemihl. He was born in Oberammergau, Bavaria, and studied law at Munich and Erlangen, practicing his profession for a time at Dachau and Munich. After 1899 he was editor of *Simplicissimus*. He is noted for his rather broadly humorous short stories and sketches, especially of Bavarian life, for his dramas and political satires. Among his writings, which went through many editions, are: *Agricola und andere Bauerngeschichten* (1897); *Assessor Karlichen und andere Geschichten* (1900); *Die Medaille*, a comedy (1901); *Die Lokalbahn*, a comedy (1902); *Lausbuben-geschichten* (1904); *Andreas Böst*, a novel (1905); *Tante Frieda*, a tale (1906); *Moral*, a comedy (1909); *Der Wittiber*, a novel (1911); *Magdalena* (1912); *Das Säuglingsheim* (1913).

THOMAR, COUNT DE. See COSTA CABRAL, A. B. DA.

THOMAS, tōm'as (Gk. Θωμάς, Aram. *Te'uma'*, from Heb. *Tōām*, twin). One of the Twelve Apostles. In the Synoptic Gospels and the Acts he is mentioned by this name in the lists of the twelve disciples (Mark iii. 18; Matt. x. 3; Luke vi. 15; Acts i. 13). In the Fourth Gospel, however, it is made apparent that this name is an appellative (John xi. 16; xx. 24; xxi. 2). In the Sinaitic Syriac manuscript John xiv. 22 reads "Thomas" instead of "Judas," which hints at an early identification of Thomas with Judas, the son of James. This identification appears also in the Syriac source from which Eusebius translated the story of King Abgar and Thaddæus, and in the apocryphal *Acts of Thomas*. The Fourth Gospel alone gives us any information of him beyond his name, disclosing him as one who was inclined to overestimate difficulties (xiv. 5) and to be troubled with doubts (xx. 24, 25), but, at the same time, as one whose loyalty to the Master made him willing to face whatever difficulties there were (xi. 16), and whose response to the Master's assurances changed his doubts into instant faith (xx. 26-28). Though nothing more is said of him in the New Testament, he figures prominently in the traditions concerning the spread of Christianity in the Far East. The

Syrian Abgar legend relates that it was he who sent Thaddæus, the Apostle of eastern Syria, to that country. A tradition older than Eusebius gives Parthia as his mission field; while another, embodied in the Gnostic *Acts of Thomas*, made him the Apostle of India. To him the "Thomas Christians" of southern India assign their origin. Mount St. Thomas, near Madras, is the place of his reputed martyrdom. As these Christians were closely connected with east Syrian Christianity, it is probable that the basis of the whole fabric of tradition is some actual missionary labor of the Apostle Thomas in eastern Syria. See APOCRYPHA; CHRISTIANS OF SAINT THOMAS.

THOMAS, CHRISTIANS OF SAINT. See CHRISTIANS OF SAINT THOMAS.

THOMAS, GOSPEL OF. See APOCRYPHA, *New Testament*.

THOMAS, A (LEERT) E (LLSWORTH) (1872-). An American playwright. He was born at Chester, Mass., and graduated from Brown University in 1894. From 1895 to 1909 he was engaged in newspaper work in New York on the staffs of the *Tribune*, *Evening Post*, *Times*, and *Sun*. Thomas wrote the novel *Cynthia's Rebellion* (1904), and the plays *Her Husband's Wife* (produced, 1910; published, 1914); *What the Doctor Ordered* (1911); *The Divorce Fund* (1911); *Little Boy Blue* (1911); *The Rain-bow* (1912).

THOMAS, tō'mā', AMBROISE (1811-96). A French operatic composer, born in Metz. In 1828 he entered the Paris Conservatory, studied under Zimmermann and Kalkbrenner (piano), and under Douren, Barbereau, and Le Suer (counterpoint, harmony, and composition). He won the Grand Prix de Rome in 1832. He succeeded Auber as director of the Conservatory in 1871. His chief success lay in opéra comique, the best example of which was *Mignon* (1866). His compositions include the operas: *Le panier fleuri* (1839); *Le Caid* (1849); *Le songe d'une nuit d'été* (1850); *Psyché* (1857); *Hamlet* (1868); *Françoise de Rimini* (1882); ballets; cantatas; a requiem; and chamber music.

THOMAS, tō'mā', ANDRÉ ANTOINE (1857-). A French philologist and historian. He was born at Saint-Yrieux-la-Montagne (Creuse), and was educated in Paris at the Ecole des Chartes and the Ecole des Hautes Etudes (1875-78), passing thence to the Ecole Française at Rome (1879-81). From 1881 to 1889 he taught in the faculty of letters, Toulouse, and thereafter in the University of Paris, rising to be professor of French literature of the Middle Ages and Romance philology. His work is characterized by a severe and careful method as well as a perspicacious originality. He came to be generally considered the leading lexicographical authority in France. In 1889 he founded at Toulouse the quarterly review *Les Annales du Midi*, of which he was editor until 1898. His most important publications are: *Les états provinciaux de la France centrale sous Charles VII* (2 vols., 1879); *Inventaire sommaire des archives communales de Limoges* (1882); *Nouvelles recherches sur l'entrée de Spagne* (1882); *Francesco da Barberino, étude sur la littérature provençale en Italie* (1883); *Poésies complètes de Bertran de Born* (1888); *Essais de philologie française* (1897); *Mélanges d'étymologie française* (1902); *Nouveaux essais de philologie française* (1904); *Le comté de la Marche et le parlerment de Poitiers (1418-1436)*

(1910); *Les registres de Boniface VIII* (3 vols., 1884-1911), with G. Digard and M. Faucon; *L'Entrée d'Espagne, chanson de geste franco-italienne* (2 vols., 1913). In collaboration with A. Hatzfeld and A. Darmesteter he published the *Dictionnaire général de la langue française* (2 vols., 1899-1900), a standard French lexicon. He became a member of the Institute of France and director of courses at the Ecole des Hautes Etudes.

THOMAS, tōm'as, AUGUSTUS (1859-). An American playwright, born in St. Louis, Mo. He was a page in the Forty-first Congress, and subsequently, after studying law and gaining some experience in practical railway work, took to journalism, becoming editor and proprietor of the *Kansas City Mirror* in 1889. Subsequently he devoted himself wholly to playwriting. His *Alabama* (produced 1891) and *Arizona* (produced 1899; published 1904) were played both in America and England. Other plays include: *In Mizzoura, Colorado*, *The Man Upstairs*, *Oliver Goldsmith*, *The Earl of Pautucket*, *The Other Girl*, *Mrs. Leffingwell's Boots*, *The Education of Mr. Pipp*, *Jim Delancey*, *The Embassy Ball*, *The Witching Hour*, *The Harvest Moon*, *As a Man Thinks* (published 1911), *Indian Summer*, *The Rio Grande*. A master in the technique of the drama, Thomas reaches a high artistic level in *Arizona* and *The Witching Hour*. A novelization of the latter appeared in 1908. He was elected to membership in the American Academy of Arts and Letters, was awarded the National Institute's gold medal in 1913, and in 1914 received an honorary A.M. degree from Williams College.

THOMAS, BRANDON (1856-1914). An English actor and playwright, born in Liverpool. His first appearance on the stage was in 1879. His farce *Charley's Aunt* (1892) made a great hit, running for 1200 successive performances in London and afterward standing the strain of perennial revival. It was also translated into several languages, and proved a success abroad as well as at home. Other plays of Thomas's were: *Comrades* (1882), his first success; *The Colour Sergeant* (1885); *The Lodgers* (1887); *The Gold Craze* (1889); *The Lancashire Sailor* (1891); *Marriage* (1892); *22a Curzon Street* (1898); *Women Are So Serious* (1901); *Fourchette and Co.* (1904); and *A Judge's Memory* (1906).

THOMAS, CALVIN (1854-1919). An American scholar, born near Lapeer, Mich. He graduated in 1874 at the University of Michigan, where, after studying philology at Leipzig, he became a member of the faculty, rising to be professor of Germanic languages and literature (1886-96). In 1896 he accepted the corresponding chair at Columbia University. Calvin Thomas was president of the Modern Language Association of America in 1896-97, and of the American Dialect Society in 1912-13. His publications include: *A Practical German Grammar* (1895; 4th ed., rev., 1905); *Goethe and the Conduct of Life* (1886); *The Life and Works of Schiller* (1901); *A History of German Literature* (1909). In addition he edited *Faust* (part i, 1892; part ii, 1897), *Hermann und Dorothea* (1891), and *Torquato Tasso* (1888), and an *Anthology of German Literature* (1909), and contributed to the NEW INTERNATIONAL ENCYCLOPEDIA.

THOMAS, CHARLES LOUIS AMBROISE. See THOMAS, AMBROISE.

THOMAS, CHARLES SPALDING (1849–). J. An American legislator. He was born at Darien, Ga., graduated LL.B. from the University of Michigan in 1871, and practiced law at Denver, Colo., in 1871–79, at Leadville in 1879–85, and again at Denver after 1885. Thomas was a member of the Democratic National Committee from 1884 to 1896, and served as temporary chairman of the Democratic National Convention at Kansas City, Mo., in 1900. From 1899 to 1901 he was Governor of Colorado, and in 1913 was elected United States Senator for the unexpired term of Charles J. Hughes, being re-elected for the term 1915–21.

THOMAS, CYRUS (1825–1910). An American anthropologist, born at Kingsport, Tenn. Admitted to the bar in 1851, he practiced law until 1865, when he became a minister of the Evangelical Lutheran church. He served as an assistant on the United States Geological Survey in 1869–73, as professor of natural science in the Southern Illinois Normal University in 1873–75, as State entomologist of Illinois in 1874–76, and as a member of the United States Entomological Commission in 1876–77. From 1882 until his death he was archaeologist of the United States Bureau of Ethnology. He published: *Synopsis of the Acrididae of North America* (1873); *Mound Explorations of the Bureau of American Ethnology* (1887); *Introduction to the Study of North American Archaeology* (1898); *Indians of North America in Historic Times* (1903), with W J McGee; and a large number of bulletins on Indian languages, calendars, writings, and similar subjects.

THOMAS, DAVID (1813–94). A British Congregational minister. He was born at Watson, near Tenby, Wales; was educated at Newport Pagnell (now Cheshunt) College; and from 1844 to 1877 was minister of the Stockwell Independent Church, London. The remainder of his life was spent in retirement. He was greatly admired as a preacher, and had a large circle of readers for his monthly, *The Homilist*, or *Voice for the Truth* (1852–82), and for his collection of writings called *The Homilist Library* (1882–89). He compiled a liturgy for Evangelical churches (1856), and a hymn book (1866), which contained some fair hymns of his own composition.

THOMAS, EDITH MATILDA (1854–1925). An American writer. She was born in Chatham, Ohio, and was educated at the normal school of Geneva, Ohio. She began writing early for the local newspapers, and was encouraged by Mrs. Helen Hunt Jackson in 1881 to send verse to more important periodicals. Her first volume appeared in 1885, entitled *A New Year's Masque and Other Poems*. Other books are: *The Round Year* (1886); *Lyrics and Sonnets* (1887); *Babes of the Year* (1888); *Babes of the Nation* (1889); *Heaven and Earth* (1889); *The Inverted Torch* (1890); *Fair Shadow Land* (1893); *In Sunshine Land* (1895); *In the Young World* (1895); *A Winter Swallow, and Other Verse* (1896); *The Dancers* (1903); *Cassia, and Other Verse* (1905); *Children of Christmas* (1907); *The Guest of the Gate* (1909); *The White Messenger, and Other War Poems* (1915).

THOMAS, GEORGE HENRY (1816–70). A distinguished American soldier, born in Southampton Co., Va. He graduated at West Point in 1840; served in the Mexican War, and distinguished himself at Monterey and Buena Vista. After the close of the Mexican War he served

a year in Florida, three years as cavalry and artillery instructor at West Point, and then for five years in Texas as major in the Second Cavalry. On the outbreak of the Civil War, though he was by birth and associations a Southerner, he adhered to the Union cause; was lieutenant colonel (afterward colonel) of the Second Cavalry; commanded a brigade in the first Shenandoah campaign; and early in 1862 won the battle of Mill Springs, Ky. He commanded the right wing of the Army of the Tennessee during the siege of Corinth, and was in full command during a great part of June, 1862. He held command of the centre of the Army of the Cumberland, and though appointed to supersede Buell as commander of the whole army, asked to remain in a subordinate position. He rendered conspicuous service at Perryville and Stone River (q.v.), and led the Fourteenth Army Corps in the campaign of middle Tennessee in the summer of 1863. At Chickamauga, Sept. 19–20, 1863, Thomas stood firm, and resisted the concentrated attack of a victorious enemy, gaining the title of "the Rock of Chickamauga." Soon after he reluctantly succeeded to the post held by Rosecrans, and commanded the Army of the Cumberland at Missionary Ridge, and in the campaign of 1864 up to the capture of Atlanta. When Sherman marched thence to the sea, Thomas was sent into Tennessee, where, in the battle of Nashville, Dec. 15–16, 1864, he crushed Hood's army. He was at once appointed a major general in the regular army, and Congress tendered him a vote of thanks. In 1865–66 General Thomas commanded the Military Division of the Tennessee, including Kentucky, Tennessee, Georgia, Alabama, and Mississippi, and the Department of the Tennessee, including the same States, in 1867. From June, 1869, until his death, he was in command of the Military Division of the Pacific, with headquarters at San Francisco. General Thomas was a man of sterling qualities, and a courageous and skillful officer. He enjoyed to a marked degree the loyalty of his men and the confidence of his superiors. Consult: T. B. Van Horne, *Life of Major General G. H. Thomas* (New York, 1882); Henry Coppée, *Life of General Thomas* (ib., 1893); Gamaliel Bradford, in *Union Portraits* (Boston, 1916).

THOMAS, ISAIAH (1749–1831). An American printer, born in Boston, Mass. He was a printer at Newburyport in 1767, and in 1770, in partnership with his former employer, established the *Massachusetts Spy*, becoming sole editor at the end of three months, and conducting the paper first at Boston and then (after 1774) at Worcester until 1801. His paper became the organ of the Whig or Patriot party, and fearlessly attacked the measures of the British ministry. At Worcester and later at Walpole, N. H., he published a number of reprints of standard English works, besides Bibles, hymn books, school books then in general use, and a magazine, *The Farmers' Museum*. In 1788 he opened a bookstore and publishing house in Boston and (1789–1796) published *The Massachusetts Magazine*. He issued the *New England Almanac* (1775–1801), wrote an excellent *History of Printing in America* (1810), and founded (1812) the American Antiquarian Society, giving it his large library and a liberal endowment. Consult B. F. Thomas, *Memoir of Isaiah Thomas* (Boston, 1874), and "Diary of Isaiah Thomas, 1805–1828," edited by B. T. Hill, in *American An-*

tiquarian Society, *Transactions*, vols. ix, x (Worcester, 1909).

THOMAS, JOHN (1725-76). An American soldier, born at Marshfield, Mass. He studied medicine, and became eminent as a physician. In 1746 he served as surgeon in a regiment sent to Nova Scotia, and in 1747 acted first as surgeon and then as lieutenant under Shirley. In 1759 he became a colonel of provincials, and in 1760 led a regiment at Crown Point and was at the capture of Montreal. He was appointed a brigadier general in June, 1775, and a major general in the following March. During the siege of Boston he was stationed on the Roxbury side, and on the night of March 4, 1776, with 3000 men, occupied Dorchester Heights, thus rendering Boston untenable for the British, who evacuated it on the 17th. He then was appointed to succeed Montgomery in Canada, and took command before Quebec on May 1; but, finding the army small in numbers and weakened by disease, he ordered a retreat. Contracting the smallpox, he died near Montreal on May 30.

THOMAS, JOHN JACOB (1810-95). An American horticulturist and writer. He was born near Lake Cayuga, in central New York, and there spent his life on a farm. For nearly 60 years he exercised a wide influence as an editorial writer for the *Cultivator* and the *Country Gentleman*, his articles dealing with a great variety of practical farm topics. He also published a book, *Farm Implements and Machinery* (1869), and a nine-volume work, *Rural Affairs* (1855-81), both of which were valuable in their day and serve as records of their time. His fame rests chiefly upon his work as a pomologist and upon his book, *The American Fruit Culturist*, which appeared first in 1845. As revised by W. H. S. Wood in 1897 it reached its twentieth edition. The twenty-first edition was issued in 1903, and this was reprinted in 1909.

THOMAS, JOSEPH (1811-91). An American lexicographer and physician. He was born in Cayuga Co., N. Y.; educated at the Polytechnic Institute, Troy, and at Yale College, and then studied medicine in Philadelphia. In 1857-58 in India, and afterward in Egypt, he made a special study of Sanskrit, Persian, Arabic, and other Oriental languages. Subsequently he became professor of Latin and Greek at Haverford College, Pa. In association with Thomas Baldwin he published in 1845 *A Pronouncing Gazetteer*, in 1854 *A New and Complete Gazetteer of the United States*, and in 1855 *The Complete Pronouncing Gazetteer of the World*, which has been often revised. In 1870-71 appeared his *Universal Pronouncing Dictionary of Biography and Mythology*, a work of painstaking labor (3d ed., revised, 1905). Thomas also edited *A Comprehensive Medical Dictionary* (1864; revised, 1886).

THOMAS, LORENZO (1804-75). An American soldier, born in Newcastle, Del. He graduated at the United States Military Academy in 1823, and served in the Florida War. In 1838 he was appointed assistant adjutant general, in 1839-40 was chief of staff of the forces in Florida, served in the Mexican War as chief of staff of Gen. W. O. Butler, and was brevetted lieutenant colonel for gallantry at Monterey. From 1861 to 1863 he was adjutant general with rank of brigadier general, and during the remaining two years of the war organized colored troops in the Southern States. President Johnson in 1868 appointed him Secretary of War, dismissing

Stanton, but as the latter refused to vacate his post, Thomas did not assume the office. In 1865 he was brevetted major general, and in 1869 was retired.

THOMAS, M(ARTHA) CAREY (1857-). An American educator, born at Baltimore, Md. She graduated at Cornell in 1877, and studied also at Johns Hopkins and at Leipzig and Zurich (Ph.D., 1883). She was the first woman to receive such a doctorate at a European university. In 1885 she became professor of English and dean, and in 1895 president, of Bryn Mawr College. She was elected a trustee of Cornell, and was honored by the degree of LL.D. from the Western University of Pennsylvania and from Brown. She published: *Sir Gawayne and the Green Knight* (1883); *Education of Women* (1900), and articles in the *Educational Review*. In 1915 Miss Mary Garrett, who had been prominent in suffrage work and a benefactor of Bryn Mawr, left to President Thomas \$15,000,000 to be disposed of as she saw fit.

THOMAS, SETH (1785-1859). An American manufacturer, born in Wolcott, Conn. After receiving a meagre education, he was apprenticed to a carpenter and joiner in New Haven. Subsequently he settled in Plymouth Hollow (now Thomaston) and with two partners began the manufacture of clocks, finally becoming sole proprietor of an establishment which grew to be one of the largest clock factories in the world.

THOMAS, SIDNEY GILCHRIST (1850-85). A British metallurgist and inventor. Born in London, he received an elementary education at Dulwich College, but by study after hours spent as a clerk was able to gain a knowledge of chemistry, especially in its relations to technology. When opportunity offered he attended lectures at the Royal School of Mines and was able to pass examinations for the degree in metallurgy, but this was denied him, owing to absence from day lectures. From 1870 he worked on the elimination of phosphorus in the Bessemer converter, and in 1875 reached a practical solution of the problem by employing a basic lining of magnesia or magnesian limestone. He secured the coöperation of his cousin Percy Gilchrist, also a chemist, and after obtaining a first patent in November, 1877, announced the invention in the following year. The process (discussed under IRON AND STEEL, *Bessemer Process*) soon came into wide use everywhere, and Thomas received both financial returns and scientific honors, notable among which was the Bessemer medal of the Iron and Steel Institute of Great Britain in 1883. Consult *Jeans, Creators of the Age of Steel* (London, 1884).

THOMAS, THEODORE (1831-1905). An American orchestral conductor, born in Esens, East Friesland. He received his musical education from his father, and played the violin at public concerts when only six years of age. He came with his parents to America in 1845, was a member of the orchestra of the Italian opera in New York, and played first violin in the first American concert tour of Jenny Lind. In 1861 he began the formation of an orchestra that became famous, and in 1864 gave his first symphony concerts in New York. In 1866 he instituted summer-night festivals. For nine years from 1869 he made an annual round of the principal American cities. In 1878 he accepted the position of director of the College of Music at Cincinnati, but in 1880 he returned to New York, where he was conductor of the Philhar-

monic Society until 1890. The orchestra which he built up in Chicago, where he lived thereafter, came to be recognized as one of the great orchestras of the world. Notwithstanding a heavy annual deficit, the orchestra's guarantors supported Thomas in his determination to present nothing but the best in music. He finally succeeded in winning the public to his own ideals. (See CHICAGO ORCHESTRA.) Consult G. P. Up-ton, ed., *Theodore Thomas: a Musical Autobiography* (2 vols., Chicago, 1905), and for side-lights, Rose Fay Thomas (his wife), *Our Moun-tain Garden* (New York, 1904; new ed., 1915).

THOMAS, THEODORE GAILLARD (1832-1903). An American gynæcologist, born in Edisto Island, S. C., and educated in Charleston. He studied in Europe, principally in Paris and Dublin, in 1853-55, and began the practice of his profession in New York. He was a lecturer in New York University (1855-63), and professor in the College of Physicians and Surgeons, New York City (1863-89), where he held the chair of gynæcology when he retired. Thomas was the first to perform and publish an account of vaginal ovariectomy (1870). He wrote *Diseases of Women* (Philadelphia, 1868), which passed through six editions in English, and was translated into French, German, Spanish, Chi-nese, and Italian.

THOMAS, W. H. GRIFFITH (1861-). A Canadian theologian. He was born in England, graduated at Christ Church, Oxford, and was ordained priest of the Church of England in 1885. After filling several minor appointments he was vicar of St. Paul's, Portman Square, London, in 1896-1905, and principal of Wycliffe Hall, Oxford, in 1905-10. In the latter year he was appointed professor of the Old Testament at Wycliffe College, Toronto. His publications in-clude: *Methods of Bible Study* (1902); *Hand-book of the Acts* (1905); *The Catholic Faith* (1906); *Commentary on Genesis* (3 vols., 1907-08); *The Power of Peace* (1908); *Christianity in Christ* (1909); *Life Abiding and Abounding* (1909); *Commentary on Romans* (3 vols., 1911-12); *The Work of the Ministry* (1911); *The Holy Spirit of God* (1913); *The Prayers of St. Paul* (1914).

THOMAS À BECKET, à bék'ët. See BECKET.

THOMAS À KEMPIS. See KEMPIS.

THOMAS AQUINAS. See AQUINAS.

THOMAS HUBBARD, CAPE. See HEIBERG LAND.

THOMASIUS, tō-mă'zē-us, CHRISTIAN (1655-1728). A German philosopher and jurist, born in Leipzig. He began to lecture in the Univer-sity of Leipzig. His lectures were free from ped-antry, and were delivered in the German lan-guage instead of the traditional Latin. These innovations brought hostility from conservative educators. He edited the first scientific journal in German, but its liberal tone excited so much opposition that he was forced to leave Leipzig. He went to Halle in 1690, where he was one of the founders of the university and its first pro-fessor of jurisprudence. His great aim was to harmonize and blend science and life. His im-portant works were: *Institutionum Jurispru-dentiæ Divinæ Libri Tres* (1688); *Fundamenta Juris Naturæ et Gentium* (1705); and *Geschichte der Weisheit und Thorheit*. Consult B. A. Wagne-r, *Christian Thomasius: ein Beitrag zur Würdigung seiner Verdienste um die deutsche Litteratur* (Berlin, 1872); R. Kayser, *Thom-*

asius und der Pietismus (Hamburg, 1900); A. D. White, *Seven Great Statesmen in the War-fare of Humanity with Unreason* (New York, 1910).

THOMASIUS, GOTTFRIED (1802-75). A Ger-man theologian. He was born at Egenhausen, Württemberg, studied at Erlangen, Halle, and Berlin, and was professor of systematic theology at Erlangen from 1842 till his death. His most important publications were: *Origines* (1837); *Christi Person und Werk* (1852-61; 3d ed., 1886-88); *Die christliche Dogmengeschichte* (1874-76; 2d ed., 1886-89). Consult A. von Stählin, *Löhe, Thomasius, Harless* (Leipzig, 1887).

THOMAS (Lat. pron. thō'mās) **MAGIS/TER** (Gk. Θωμάς ὁ Μάγιστρος, *Thōmas ho Magistros*, Master Thomas). A Greek rhetorician and grammarian of the early part of the fourteenth century, born probably at Thessalonica. For some time at the court of the Byzantine Emperor Andronicus Palæologus II, he held important offices. Later, having retired to a monastery, he compiled a Lexicon of Attic Greek ('Εκλογαὶ Ὀρομάτων Ἀττικῶν). His works also include scholia to Æschylus, Sophocles, Euripides, and three plays of Aristophanes, which are preserved with the other scholia to those authors, as well as lives of these writers which have come down to us in the manuscripts of their works. Letters and orations of Thomas Magister have been pre-served. Especially noteworthy is the oration on Gregory of Nazianzus. The earliest edition of the Lexicon is that of Z. Callierges (1517); the latest, that of Ritschl (1832).

THOMAS OF AQUINO. See AQUINAS, THOMAS.

THOMAS OF CELANO, chā-lă'nō (c.1200-c.1255). One of the first members of the Fran-ciscan Order. He was born at Celano, in the Abruzzi, became acquainted with Francis of Assisi, and was in 1221 sent by him upon a mis-sion to Germany. In 1222 he was placed over the monasteries of Worms, Speyer, Mainz, and Cologne, but in 1230 we find him again in Italy. His intimacy with Francis eminently fitted him to be his biographer, and he wrote two sketches of the saint, which are of primary importance (Eng. trans., 1908), as well as the *Life of St. Clara* (Eng. trans., 1910). Of more universal interest is his claim, now prac-tically admitted by all scholars, to be considered the author of the *Dies Iræ* (q.v.), except perhaps the last six verses.

THOMAS OF ERCELDOUNE. See THOMAS THE RHYMER.

THOMAS SLAG, PHOSPHATIC SLAG, BASIC SLAG. A by-product of the manufacture of steel from phosphatic ores by the basic or Thomas (see THOMAS, S. G.) process, in which phos-phorus is eliminated from the pig iron by means of basic (rich in lime) lining to the Bessemer converters and by adding lime to the molten pig iron. The slag is therefore rich in lime (about 15 per cent in the free state and 40 per cent com-bined with other substances). The phosphoric acid content of the product as found in the mar-ket is very variable, ranging from 10 to 25 per cent. Slag of average quality contains 15 to 20 per cent of phosphoric acid. In good slag 80 per cent of this phosphoric acid should be avail-able, as shown by the chemical methods of de-termining availability, viz., treatment with a weak solution of citric acid or ammonium citrate. The phosphoric acid of slag, unlike that of super-

phosphates, is practically insoluble in water. Attempts have been made with some success to prepare a slag in which the phosphoric acid is more available by fusing the product as obtained from the converters at about 900° C. with sufficient silica (quartz) to convert the free lime into silicate. Such slag differs materially from the untreated product not only in containing a higher percentage of available phosphoric acid and of silica, but in being practically devoid of free lime. Basic slag is not suited to the manufacture of superphosphates and is generally used without any treatment except fine grinding. The value of the material depends very largely upon its fineness.

Slag has been used in large quantities for agricultural purposes in Europe for a number of years. At the time of the outbreak of the Great War in 1914 the world's consumption had reached about 4,500,000 tons annually. It has not been extensively introduced into the United States, although a limited amount is being made there. Experiments have shown slag to be a very valuable phosphatic fertilizer, and on account of its high percentage of lime especially suited to use on acid soils and those rich in organic matter. It would not be wise to use it freely on poor sandy soils deficient in organic matter.

Slag appears to be especially suited to leguminous crops. Six hundred to 1000 pounds per acre is considered a liberal dressing. It should not be mixed with ammonium sulphate before use, since its high percentage of free lime is likely to cause a loss of ammonia by volatilization. Mixtures of the slag with other salts, such as muriate of potash and nitrate of soda, cake badly and are difficult to handle and distribute uniformly. See MANURES AND MANURING.

THOMAS THE RHYMER, or more correctly THOMAS OF ERCELDOUNE, or THOMAS LEARMONT (c.1220-c.1297). A Scottish seer and poet, about whom very little is positively known. Erceldoune (now called Earlstoun) was a village in Berwickshire on the river Leader, about two miles above its junction with the Tweed. There is mention of Thomas as a seer in the continuation of Fordun's *Scotichronicon*, attributed to Walter Bower (died 1449). For centuries all sorts of prophecies were connected with his name. A collection of them was published at Edinburgh in 1603 under the title *The Whole Prophesie of Scotland*. To Thomas the Rhymer has been attributed a beautiful fairy story in verse. According to the legend, Thomas met a "lady fair" at Huntly Banks and was conveyed to fairyland, where he acquired knowledge that made him famed. After some time there he was permitted to go to the earth to practice his prophetic skill, on condition that he should return at the fairy's bidding. One day, while he was making merry with his friends, the summons came. He disappeared in the forest and never came again to earth. The poem, consisting of the minstrel's usual prologue and three fyttes, contains 700 lines. It exists in four complete manuscripts, the oldest being the *Thornton* at Cambridge (assigned to 1430-40). Though they are all in English, they point to an older original, which may have been the composition of Thomas. Sir Walter Scott and others also ascribed to Thomas the verse romance of *Sir Tristrem*. It exists in a single manuscript in the Advocates' Library at Edinburgh. Though the poem contains allusions to Thomas of Erceldoune, his authorship is now questioned.

Consult *The Romance and Prophecies of Thomas of Erceldoune*, edited by J. A. H. Murray for the Early English Text Society (London, 1875) *Thomas of Erceldoune*, edited by Brandl (Berlin, 1880).

THOMASTON. A town in Litchfield Co. Conn., 10 miles by rail north of Waterbury, on the Naugatuck River and on the New York New Haven, and Hartford Railroad (Map: Connecticut, C 3). There are large clock and watch factories, a brass rolling mill, and manufactories of cutlery and brass products. Pop., 1900, 3300 1910, 3533.

THOMASVILLE, tōm'as-vīl. A city and the county seat of Thomas Co., Ga., 200 miles west of Savannah, on the Ochlocknee River and on the Atlantic Coast Line, the Atlanta, Birmingham, and Atlantic, and the Florida Central railroads (Map: Georgia, B 5). It is picturesquely situated on high ground, and has attained considerable prominence as a winter and health resort. There are three large hotels. The South Georgia College and Young's College for Women are here, and the city has also a public library, a normal school for negroes, the Vasht Home for Girls, and Paradise, McIntyre, and Magnolia parks. Thomasville is surrounded by a fertile region producing cotton, sugar cane tobacco, melons, figs, pears, grapes, and vegetable. Its manufacturing interests are centred mainly in the lumber industry, and there are iron works. Thomasville was settled in 1850 and received its present charter in 1889. Pop., 1900 5322; 1910, 6727.

THOMASVILLE. A city in Davidson Co. N. C., 22 miles southwest of Greensboro, on the Southern and the Carolina and Yadkin railroads (Map: North Carolina, B 2). It contains the Thomasville Baptist Orphanage. There are machine shops, a veneer and woodworking plant cotton mills, and manufactories of chairs spokes, handles, and furniture. Pop., 1910, 3877

THOMÉ, tō'má', FRANÇOIS (commonly called Francis) (1850-1909). A French composer born at Port-Louis, Mauritius. From 1866 to 1870 he attended the Paris Conservatory, studying pianoforte with Marmontel and theory with Duprato. He is known chiefly for his piano pieces, which are distinguished by grace and refinement. His ballets and pantomimes enjoyed considerable popularity during the composer's life.

THOMIST, thō'mist. A follower of Thomas Aquinas (q.v.) in philosophy or theology. See ALEXANDRISTS.

THOMMEN, tōm'men, ACHILLES (1832-93) An Austrian engineer, born at Basel, and educated at the university of his native town and in the polytechnic institute of Karlsruhe. He built the railroad over the Brenner Pass in 1861-67. From 1867 to 1869 he was head of the railroad system of Hungary. He wrote *Die Gotthardbahn-Bemerkungen zur Reform* (1877).

THOMPSON, tōmp'son. A town, including several villages, in Windham Co., Conn., miles northeast of Putnam, on the Quinebaug River, and on the New York, New Haven, and Hartford Railroad (Map: Connecticut, H 2). Farming and the manufacture of cotton goods and woollens are the leading industries of the community. Originally a part of Killingly Thompson became a parish in 1728, and was incorporated as a town in 1785. Pop., 1900, 644 1910, 4804.

THOMPSON, AUGUSTUS CHARLES (181

1901). An American Congregational clergyman. He was born at Goshen, Conn., and studied at Yale College, at Hartford Theological Seminary, and the University of Berlin. He became pastor of the Eliot Congregational Church, Roxbury, Mass. (1842). He visited India with Dr. Rufus Anderson (1854-55), and lectured on foreign missions at Andover Theological Seminary (1877-80), at Boston University (1882), and at Hartford Theological Seminary (1885-86). His publications include memorials of Mrs. Anna J. Waters (1854), of H. M. Mill (1856), of Rev. Dr. Rufus Anderson (1880); *Moravian Missions* (1882); *Foreign Missions* (1889); *Protestant Missions* (1894); *Eliot Memorial* (Boston, 1900); and numerous works of a popular character.

THOMPSON, BENJAMIN. See RUMFORD, BENJAMIN THOMPSON, COUNT.

THOMPSON, CHARLES MINER (1864-). An American editor and author. He was born at Montpelier, Vt., and graduated from Harvard in 1886. In 1887-90 he served as literary editor of the *Boston Advertiser*. He was associate editor of the *Youth's Companion* from 1890 to 1911, thereafter editor in chief, and after 1912 part owner. Among his entertaining stories are: *The Nimble Dollar* (1895), a book for boys; *The Calico Cat* (1908); *An Army Mule* (1910).

THOMPSON, DANIEL GREENLEAF (1850-97). An American psychologist and sociologist. He graduated at Amherst College in 1869 and was admitted to the bar in New York in 1872. However, he devoted his time mainly to the psychology of religion and sociological subjects, and is chiefly known for his *System of Psychology* (2 vols., 1884); *The Religious Sentiments of the Human Mind* (1888); *Social Progress* (1889); *The Philosophy of Fiction in Literature* (1890); *Politics in a Democracy* (1893). In his books Thompson takes a position violently antagonistic to various dogmas.

THOMPSON, DANIEL PIERCE (1795-1868). An American lawyer, politician, and novelist, born at Charlestown, Mass. He graduated at Middlebury College (1820), went to Virginia as tutor, studied law there, and was admitted to the bar (1823). He settled in Montpelier, Vt., in 1824, held various legal offices in that State, compiled, by legislative appointment, *Laws of Vermont from 1824 down to and including the Year 1834* (1835), was Secretary of State of Vermont (1853-55), and editor of a political weekly, *The Green Mountain Freeman* (1849-56). His first novel was a satire on the Anti-Masonic agitation, *The Adventures of Timothy Peacock* (1835). In the same year was published his *May Martin, or the Money Diggers*. Much popularity was achieved by *The Green Mountain Boys* (1840) and *The Rangers* (1857), romances of Revolutionary Vermont. He also wrote a *History of Montpelier, 1781-1860* (1860).

THOMPSON, DAVID (1770-1857). A Canadian explorer, born in Westminster, London. He was educated at Oxford and in 1789 came to America in the service of the Hudson's Bay Company. He became engaged in explorations near the Great Lakes, in 1798 discovered Turtle Lake, one of the sources of the Mississippi, and in 1807-11 crossed the Rocky Mountains and explored the course of the Columbia River. In 1797 he became connected with the Northwest Company. He was with the Canadian-United States boundary survey (1816-26), later hav-

ing charge of surveying and exploring expeditions in the Canadian Northwest. He published *A Map of the Northwest Territory of the Province of Canada* (1814).

THOMPSON, DENMAN (1833-1911). An American actor, best known for his impersonation of the rustic "Josh" Whitcomb. He was born in Erie Co., Pa., but passed his boyhood in Swansey, N. H., where he found some types that he later made famous. His stage debut was at Lowell, Mass., in 1852. *Joshua Whitcomb* was first brought out in 1875. In 1886 Mr. Thompson produced *The Old Homestead*, in which the same leading character appears, and this play, with its depiction of country life, became the material of his subsequent popularity. It ran for four successive seasons in New York (1888-91), and toured the United States for years. Consult McKay and Wingate, *Famous American Actors of To-Day* (New York, 1896).

THOMPSON, SIR EDWARD MAUNDE (1840-). An English antiquary, born in Jamaica, West Indies. After studying at Rugby and at University College, Oxford, he was called to the bar at the Middle Temple in 1867. In 1861 he was appointed assistant in the British Museum; in 1878 he became keeper of the manuscripts and Egerton librarian; and was principal librarian (1888-1909). He was Sanders reader in bibliography at Cambridge (1895-96; 1905-06), and was knighted in 1895, receiving the G.C.B. in 1909. Editions by him include: *Chronicon Angliæ, 1328-88*, in the "Rolls Series" (1874); and, for various societies: *Letters of Humphrey Prideaux* (1875); *Chronicon Adæ de Usk, 1377-1404* (1876); *Correspondence of the Family of Hatton* (1878); *Diary of Richard Cocks in Japan, 1615-22* (1883); the facsimile of the "Laurentian Sophocles" (1885), with Professor Jebb. Thompson's *Handbook of Greek and Latin Palæography* (1893) appeared in an enlarged edition as *Introduction to Greek and Latin Palæography* (1912).

THOMPSON, ERNEST SETON. See SETON, ERNEST THOMPSON.

THOMPSON, FRANCIS (1860-1907). An English poet, the son of a Lancashire physician. He was educated at the Ushaw Roman Catholic College, near Durham, and then studied medicine at Owens College, Manchester. Giving up medicine, he went to London, where, after a sharp struggle with poverty, he was "discovered" and rescued by Wilfrid and Alice Meynell (qq.v.), and then suddenly found himself famous. His *Poems* (1893) ran through several editions, receiving high praise from the reviewers and from Browning. This volume was followed by *Sister Songs* (1895) and *New Poems* (1897). Thompson's early experience broke down his health, and he died of tuberculosis. Essentially a mystic, he takes high rank among the poets of his time. In prose, he wrote literary criticism for the *Academy* and the *Athenæum*; *Health and Holiness* (1905), and the following books posthumously published: *Life of St. Ignatius Loyola* (1909); the admirable essay, *Shelley* (2d ed., 1909); *A Renegade Poet, and Other Essays* (1910); *Life of John Baptist de la Galle* (1911). A three-volume edition of his *Works* appeared in New York in 1913. Consult: P. E. More, *Shelburne Essays* (7th series, New York, 1910); G. A. Beacock, *Francis Thompson* (Marburg, 1912); K. Rooker, *Francis Thompson* (in French, London, 1913); Everard Meynell, *Life of Francis Thompson* (New York, 1913).

THOMPSON, GEORGE (1804-78). An English abolitionist. He was born in Liverpool, England, and first became known in 1833 by his lectures in connection with the antislavery agitation throughout the British colonies. He was largely instrumental in procuring the freedom of the slaves and the abolition of the apprenticeship system. He was a member of the Anti-Corn Law League, and also took an active part in forming the British India Association, which procured better government for the people of India. He was associated with Garrison, Whittier, and others in the antislavery movement in the United States, and a visit which he paid to that country in 1834 led to the formation of upward of 150 antislavery societies. He belonged to the National Parliamentary Reform Association of England, and from 1847 to 1852 was a member of Parliament for the Tower Hamlets District, London.

THOMPSON, SIR HENRY (1820-1904). An English surgeon, born in Framlingham, Suffolk. He was educated at University College, London, and was appointed assistant surgeon of the University College Hospital, London, in 1856; surgeon in 1863; professor of clinical surgery in 1866; and consulting surgeon in 1874. In 1884 he was professor of surgery and pathology in the Royal College of Surgeons, London. He was especially known through his operation upon the bladder. In 1864 he became surgeon extraordinary to Leopold I of Belgium (by whom, owing to the success of an operation, he was knighted in 1867), and in 1868 to his successor, Leopold II. He also operated upon Napoleon III (1872) shortly before the ex-Emperor's death. He studied painting, and frequently exhibited pictures at the Royal Academy (London), the Salon (Paris), and elsewhere. He first brought before the English public the desirability of cremation and in 1874 founded the Cremation Society of London. Several of his books were translated into German and French. The best known include: *Practical Lithotomy and Lithotomy* (1863); *Clinical Lectures on Diseases of the Urinary Organs* (1868); *Modern Cremation* (1890); *On Food and Feeding* (1901); and the novels *Charley Kingston's Aunt* and *All But*, which appeared under the pseudonym of "Pen Oliver."

THOMPSON, JACOB (1810-85). An American politician, born in Caswell Co., N. C. He graduated at the University of North Carolina and in 1834 he was admitted to the bar, and in the next year removed to the Chickasaw country in Mississippi. From 1839 to 1851 he was a member of the United States House of Representatives, served as chairman of the Committee on Indian Affairs, and advocated nonacceptance of the Compromise of 1850. In 1857 he became Secretary of the Interior, and greatly systematized the work of the department, though the defalcation of a trusted clerk clouded his administration. In January, 1861, he resigned and was appointed aid to General Beauregard, and served with him through the Shiloh campaign. From 1862 to 1864 Thompson was Governor of Mississippi. In the latter year he was sent as Confederate Commissioner to Canada, and to organize the Confederate sympathizers in Ohio, Indiana, and Illinois. Unsuccessful attempts were made to capture the gunboat *Michigan*, and to organize the escaped Confederate prisoners, and to take Camp Douglas, free the prisoners there confined, and take Chicago. After the

assassination of Lincoln, Thompson was charged with complicity, and a price was put upon his head. He escaped to Europe, however, and remained there some time. When he returned he was not brought to trial, though a civil suit was brought in 1876 for the money taken by the dishonest clerk while Thompson was Secretary of the Interior.

THOMPSON, JOHN REUBEN (1823-73). An American journalist and poet, born in Richmond, Va. He graduated at the University of Virginia (1844), practiced law in Richmond, became in 1847 editor of the *Southern Literary Messenger*, which for 12 years he made influential. In it appeared early writings of D. G. Mitchell, John E. Cooke, Philip P. Cooke, Paul Hayne, and Henry Timrod. In 1859 he moved to Augusta, Ga., to edit *The Southern Field and Fireside*. The Civil War drove him in 1863 to London, where he wrote for English magazines defending the Confederacy. After the war he returned to America and was literary editor of the *New York Evening Post* till 1872. His poems enjoyed local popularity.

THOMPSON, SIR JOHN SPARROW DAVID (1844-94). A Canadian statesman, born at Halifax, Nova Scotia. He received a common-school education and was admitted to the bar in 1865. Here his ability and industry soon placed him in the first rank. He took an active interest in politics and in 1877 was elected to the Nova Scotia Assembly. The next year he was appointed Attorney-General and in 1881 he became Premier. In 1882 he was appointed a justice of the Supreme Court of Nova Scotia, but in 1885 he gave up this position to accept the portfolio of Minister of Justice in the Dominion government, and in 1886 he brilliantly defended the conduct of the administration in regard to Louis Riel (q.v.). The next year he was chosen legal adviser to the British plenipotentiaries who negotiated the fisheries treaty of 1887 with the United States, and as a reward for his services was knighted (K.C.M.G.). In 1892 he became Prime Minister of Canada and in 1893 one of the arbitrators on the Bering Sea Controversy (q.v.). He died while in Windsor Castle, where he had just taken the oath as a member of the Queen's Privy Council.

THOMPSON, JOSEPH PARRISH (1819-79). An American clergyman and scholar, born in Philadelphia. He graduated at Yale in 1838, was ordained a Congregational minister in 1840, was pastor in New Haven (1840-45) and New York (1845-71), lecturer on Egyptology at Andover (1871), and engaged in Oriental studies, chiefly in Berlin, from 1872 till his death. Thompson aided in establishing the *New York Independent*. Among his publications the more noteworthy are: *Egypt, Past and Present* (1856); *Man in Genesis and Geology* (1869); *Church and State in the United States* (1874); *The United States as a Nation* (1877); *The Workman, his False Friends and his True Friends* (1879). His political and social essays are gathered in *American Comments on European Questions* (1884).

THOMPSON, LAUNT (1833-94). An American sculptor, born in Abbeyleix, Queen's County, Ireland. He came to America in 1847, settling at Albany, where he was a pupil and assistant of Erastus Palmer, with whom he remained nine years. In 1858 he opened a studio in New York City, where he first attracted attention by his medallion heads and later by some successful

portrait busts and statues. He was elected a member of the National Academy in 1862. In 1868 he passed a year at Rome, and in 1875-87 again visited Italy, residing principally at Florence. His best-known medallions are "Morning Glory" and a portrait of Gen. John A. Dix. Among his statues, which are characterized by good workmanship and dignified presentation, are: Napoleon (1867, Metropolitan Museum, New York); President Abraham Pierson (1874, Yale University); Gen. Ambrose Burnside, an equestrian statue at Providence, R. I.; Gen. Winfield Scott and Admiral Dupont, equestrian statues in Washington. Good examples of his numerous busts are those of Edwin Booth as Hamlet, Samuel F. B. Morse, and William Cullen Bryant (Metropolitan Museum, New York).

THOMPSON, (JAMES) MAURICE (1844-1901). An American novelist, poet, and journalist, born in Fairfield, Ind. His boyhood was spent chiefly in Kentucky and Georgia. He served in the Confederate army, and after the war returned to Indiana, and practiced law and civil engineering at Crawfordsville. From 1885 to 1889 he was State geologist. In 1890 he went to New York and joined the editorial staff of the *Independent*, having already made a name for himself in literature by *Hoosier Mosaics* (1875), *The Witchery of Archery* (1878), *A Tallahassee Girl* (1882), *His Second Campaign* (1882), *Songs of Fair Weather* (1883), *At Love's Extremes* (1885), *By-Ways and Bird Notes* (1885), *The Boy's Book of Sport* (1886), *A Banker of Bankersville* (1886), *Sylvan Secrets* (1887), *The Story of Louisiana* (1888), and *A Fortnight of Folly* (1888). His later writings include: *Poems* (1892); *The Ethics of Literary Art* (1893); *The Ocala Boy* (1895); *My Winter Garden* (1900), good impressionist descriptions of subtropical Louisiana; *Alice of Old Vincennes* (1900), a very popular novel and his best. Posthumously printed were two immature novels, *Sweetheart Manette* and *Milly* (1901).

THOMPSON, MORTIMER (1832-75). An American journalist and humorist, born at Riga, Monroe Co., N. Y. He studied at the University of Michigan, contributed humorous articles to the *Advertiser* of Detroit, and afterward was a writer for the *New York Tribune*, in which were published his series of letters from Niagara Falls and his account of the Pierce-Butler slave auction at Savannah, printed by the Antislavery Society as a tract. For several years he was a popular lecturer. He published under the pseudonym "Q. K. Philander Doesticks, P.B."—interpreted by him as "Queer Kitter, Philander Doesticks, Perfect Brick"—a number of volumes, including *Doesticks—What he Says* (1855); a parody of *Hawatha, Plu-ri-bus-tah: A Song that's by No Author* (1856); and *Nothing to Say, Being a Satire on Snobbery* (1857).

THOMPSON, RICHARD WINGINTON (1809-1900). An American political leader, born in Culpeper Co., Va. In 1831 he removed to Louisville, Ky., but soon afterward went to Lawrence Co., Ind., where in 1834 he was admitted to the bar. In 1840 he was elected to Congress, and in 1847 was again elected. He was appointed judge of the Fifth Indiana Circuit in 1867, and in 1877 was Secretary of the Navy in the cabinet of President Hayes. His publications include: *The Papacy and the Civil Power* (1876); *History of Protective Tariff Laws* (1888); *Personal Recollections of Sixteen Presidents* (1894); *Footprints of the Jesuits* (1894).

THOMPSON, ROBERT ELLIS (1844-1924). An American educator, born near Lurgan, Ireland. At an early age he emigrated to the United States, and in 1865 graduated at the University of Pennsylvania. From 1868 until 1892 he was a professor in the University of Pennsylvania, and in 1894 became principal of the Philadelphia Central High School. He was editorially connected with several periodicals, and published: *A History of the Presbyterian Churches of America* (1895); *The Hand of God in American History* (1902); *Harvard University Lectures on Protection to Home Industries* (1908); *The Historic Episcopate* (1910); *The History of the Dwelling House and its Future* (1914).

THOMPSON, SILVANUS PHILLIPS (1851-1916). An English physicist. He was born at York, and was educated at the Royal School of Mines and the University of London (B.A., 1869; B.Sc., 1876; D.Sc., 1878). He was lecturer and professor of experimental physics in the University College, Bristol, from 1876 to 1885, when he became principal and professor of physics in the City and Guilds Technical College, Finsbury. Professor Thompson did much to spread knowledge of electricity, while also carrying on original researches. His publications include: a popular textbook, *Elementary Lessons in Electricity and Magnetism* (1881; 7th ed., rev., 1915); *Dynamo-Electric Machinery* (1886; 7th ed., 1904); *Light, Visible and Invisible* (1897; 2d ed., 1910); *Polyphase Electric Currents and Alternate-Current Motors* (1895); *Michael Faraday: His Life and Work* (1898); *The Life of Lord Kelvin* (1910).

THOMPSON, SMITH (1768-1843). An American jurist and cabinet officer. He was born in Stanford, Dutchess Co., N. Y., graduated at Princeton College in 1788, and was admitted to the bar in 1792, having studied under Chancellor Kent. After serving as a member of the New York Legislature (1800) and of the State Constitutional Convention (1801), he became associate justice of the State Supreme Court (1802-14), and Chief Justice (1814-18). In 1818 he became Secretary of the Navy in Monroe's cabinet, and in 1823 was appointed to the United States Supreme Court, of which he remained an associate justice until his death.

THOMPSON, THOMAS PERRONET (1783-1869). An English general and political reformer. He was born in Hull and was educated at Queens' College, Cambridge. He took part in the Buenos Aires campaign, 1807, and in 1808 was made Governor of Sierra Leone. His recall to England in 1810 was due to the influence of the slave traders, against whose traffic he had taken active measures. He was with the British army in the Peninsular and French campaigns of 1813 and 1814, and in the Indian Pindari campaign of 1818. In 1820, with a small force, he was defeated at Sur, on the Arabian coast, by a band of Arabs, whom he was attempting to punish for piracy. He returned to England and in 1824 became one of the founders, and later proprietor, of the *Westminster Review*, to which he was a versatile and prolific contributor. Among his well-known publications are *Catechism on the Corn Laws* (1827), *Catechism on the Currency* (1848), *Fallacies against the Ballot* (1855). His miscellaneous writings were published as *Exercises, Political and Other* (6 vols., 1842). He was elected to Parliament (1835, 1847, and 1857). He became general in 1868.

THOMPSON, WADDY (1798-1868). An American legislator and diplomat, born in Pickensville, S. C. He graduated at the South Carolina College in 1814 and in 1819 was admitted to the bar. From 1835 to 1841 he was a member of the National House of Representatives as a Whig, and in 1840 was chairman of the Committee on Military Affairs. In 1842-44 he was Minister to Mexico, and secured the release of 200 Texan prisoners. He published *Recollections of Mexico* (1846).

THOMPSON, WILLIAM (1725-81). An American soldier. He was born in Ireland, emigrated to Pennsylvania, served (1759-60) as captain of militia in the French and Indian War, and in June, 1775, was placed in command of eight Pennsylvania companies, with the rank of colonel. In January, 1776, he took the same rank in the regular Continental army, and on March 1 became brigadier general. On March 19 he relieved Gen. Charles Lee at New York, and in April led 14 regiments to Canada to reinforce Gen. John Thomas, assuming chief command during Thomas's illness and holding it until the arrival (June 4) of General Sullivan. He led the Americans in the unsuccessful attack on the English at Three Rivers (June 6), and was taken prisoner. Though immediately paroled, he was not exchanged until Oct. 25, 1780.

THOMPSON, WILLIAM HOWARD (1871-). An American legislator. He was born at Crawfordsville, Ind., and moved to Kansas with his parents in 1880. After graduating from the Seneca (Kans.) Normal School in 1886 he studied law under his father, and was admitted to the Kansas bar in 1894. A Democrat in politics, he served as clerk of the Kansas Court of Appeals from 1897 to 1901, was judge of the thirty-second judicial district of Kansas in 1906-13, and was elected United States Senator for the term 1913-19.

THOMPSON, WILLIAM TAPPAN (1812-82). An American journalist and humorist, born at Ravenna, Ohio. He removed to Philadelphia, subsequently to Florida, and thence, in 1835, to Augusta, Ga., where he was attached to the staff of several literary weekly papers. To the *Miscellany*, of Madison, Ga., he contributed the "Major Jones Letters," upon which his fame as a humorist rests. They were published in book form as *Major Jones's Courtship* (1840). In 1850 he established at Savannah the *Morning News*, which he continued to edit during the remainder of his life. In the Civil War he served in the Confederate army as a private and on the staff of Gen. J. E. Brown. He published *Major Jones's Chronicles of Pineville* (1843) and *Major Jones's Sketches of Travel* (1848). A posthumous collection, entitled *John's Alive, or the Bride of a Ghost, and other Sketches*, was published by his daughter, Mrs. M. A. Wade, in 1883.

THOMPSON, WORDSWORTH (1840-96). An American genre and historical painter. He was born in Baltimore, Md., and studied under Gleyre and Pasini in Paris. In 1868 he opened a studio in New York City, being elected a member of the National Academy in 1875, and of the Society of American Artists two years later. He is best known as a painter of American historical subjects, executed with a smooth but skillful technique. Among his paintings are the "Review at Annapolis, Maryland, 1776" (Buffalo Academy); "Passing the Outpost" (Union

League Club, New York); a "New England Homestead," awarded a gold medal at the Paris exhibition, 1889; and his last and best work, "Old Bruton Church, Virginia, in the time of Lord Dunmore" (Metropolitan Museum).

THOMPSON RIVER INDIANS. An important Salishan-speaking tribe of Indians formerly residing on the river of the same name in British Columbia. Their proper name is Ntlakypamuk, and their culture is typically interior Salishan (q.v.). Consult: James Teit, "Traditions of the Thompson River Indians," in *American Folk-Lore Society, Memoirs*, vol. vi (Boston, 1898); id., "Thompson River Indians of British Columbia," and "Mythology of the Thompson River Indians," in *Jesup North Pacific Expedition, Publications*, vol. i, part iv and vol. viii, part ii, published by the American Museum of Natural History (New York, 1900, and Leyden, 1912).

THOMPSON SETON, ERNEST. See SETON, E. T.

THOMS, tōmz, WILLIAM JOHN (1803-85). An English antiquary, born in London. For several years, up to 1845, he was a clerk at Chelsea Hospital, and then was appointed clerk of the House of Lords; and from 1863 to 1882 he was its deputy librarian. In recognition of his scholarship he was elected a fellow of the Society of Antiquaries (1838) and secretary of the Camden Society (1838-73). Thoms is most widely known as the founder (1849) of *Notes and Queries*. Thoms published a large number of books of great value to the student and to the curious. Among them are *Early Prose Romance* (1827-28; revised by another hand, 1858); *Lays and Legends of Various Nations* (1834); *Anecdotes and Traditions Illustrative of Early English History and Literature* (Camden Society, 1839); *Hannah Lightfoot* (1867); the *Death of Charles I* (1872); and *Human Longevity* (1873). Consult Thoms's reminiscences under the title "Gossip of an Old Bookworm," in *Nineteenth Century* (London, July and December, 1881).

THOMSEN, tōm'sén, JULIUS (1826-1909). A Danish chemist, born in Copenhagen. He was educated in the Copenhagen Polytechnic School, where he was professor of chemistry (1847-56), and of which he was director (1883-92). For 30 years (1856-86) he held a chair in the Military High School, and for 25 years (1866-91) occupied one in the University of Copenhagen. Thomsen was the inventor of a process for the manufacture of soda from cryolite, brought from Greenland, but he became best known by his researches on thermochemistry, the results of which are given in his *Thermochemiske Undersøgelser* (1869-73; Ger. trans., 1882-86; Eng. trans., 1908).

THOMSEN, VILHELM LUDVIG PETER (1842-1927). A Danish philologist, born in Copenhagen, where he became professor of comparative philology at the university in 1887. He traveled extensively in Europe and Asia. Among his works are *Den gotiske Sprogklasses Indflydelse paa den finske* (1869); *The Relations Between Ancient Russia and Scandinavia and the Origin of the Russian State* (1877; Ger. trans., 1879), originally lectures delivered at Oxford University; the important *Déchiffrement des inscriptions de l'Orkhon* (1894) and *Inscriptions de l'Orkhon, déchiffrées par V. L. P. Thomsen* (1896), wherein he claims that certain ancient inscriptions found in Mongolia represent the

oldest forms known of the Turkish language. Other works deal with Lycian, Etruscan, and Runic inscriptions. Thomson was one of the foremost philologists of his time.

THOMSON, tòm'son, ALEXANDER (1817-75). A Scottish architect, born at Balforn. At the age of 17 he entered an architect's office in Glasgow and became deeply interested in Greek architecture. When some years later he began to practice architecture independently, he showed much originality and cleverness in adapting Greek motives to the modern requirements of churches and public buildings; but modern criticism denies the validity of the theory on which his designs were based, and regards his buildings in Glasgow (churches, Egyptian hall, etc.) and Edinburgh as curiosities rather than as masterpieces. He is often referred to as "Greek Thomson."

THOMSON, tòn'sôn, CÉSAR (1857-). A Belgian violinist, born at Liège. He made successful tours through Spain and Italy and became a member of Bilsé's orchestra at Berlin. He gave instruction on the violin at the Liège Conservatory from 1883 to 1897. In 1894 and 1895 he made trips to the United States, and four years later he became Ysaye's successor as professor of violin playing at the Brussels Conservatory. He is noted for his double-stop technique and for his clean-cut bowing.

THOMSON, CHARLES. See RITCHIE, BARON.

THOMSON, tòm'son, CHARLES (1729-1824). An American patriot. He was born in County Derry, Ireland, and in 1740 was brought to New Castle, Del. He was educated at New London, Pa., and when very young assumed charge of the Friends' Academy at New Castle. He took an active interest in all the controversies between the colonies and the British ministry, and, removing to Philadelphia in 1774, was chosen secretary of the Continental Congress, in which capacity he served until 1789, keeping a careful record of all the proceedings and making copious notes of the debates. John Adams (in his diary for Sept. 30, 1774) speaks of him as "the Sam Adams of Philadelphia, the life of the cause of liberty." In 1789 he was delegated to announce to Washington, at Mount Vernon, his election to the presidency. He published *An Enquiry into the Causes of the Alienation of the Delaware and Shawanese Indians* (1759); an able translation of the Bible, containing the first English version of the Septuagint (4 vols., 1808); and a *Synopsis of the Four Evangelists* (1815). He also prepared a history of the Revolution, which, however, he destroyed in manuscript. Consult L. R. Harley, *The Life of Charles Thomson* (Philadelphia, 1900).

THOMSON, CHARLES EDWARD POULETT, first BARON SYDENHAM. See SYDENHAM.

THOMSON, SIR CHARLES WYVILLE (1830-82). A British naturalist, born in Scotland as Wyville Thomas Charles, which name was changed when he was knighted. He was educated in medicine, but turned his attention to botany, and afterward to a broader consideration of natural history, and became in 1853 professor of natural history in Queen's College, Cork. In 1860 he became professor of natural science at Belfast, and in 1870 at the University of Edinburgh. He became interested in problems relating to deep-sea life, and in 1868, with Dr. W. B. Carpenter, made investigations north of Scotland in the gunboat *Lightning*. Other ocean voyages for scientific sounding and

dredging were conducted subsequently, and their results were popularly explained in *The Depths of the Sea* (1873), a volume which attracted much attention. The interest thus aroused was influential in causing the British government to undertake the renowned *Challenger* (q.v.) exploring expedition, the scientific conduct of which was given to Professor Thomson. Its successful and brilliant outcome was recognized at its close (1876) by the conferring of knighthood upon Thomson and by scientific honors from many countries. Sir Wyville resumed his lectures at the university, and began to superintend the disposal of scientific material from the expedition, placing it in the hands of specialists for exhaustive study. He prepared a general narrative, *The Voyage of the Challenger* (2 vols., 1877), but became ill in 1879 and died in 1882. Besides these books, he was the author of over forty papers of importance published in scientific periodicals, relating largely to marine zoology and especially to echinoderms, recent and fossil. He devised many methods and invented much apparatus used in deep-sea exploration (q.v.).

THOMSON, EDWARD (1810-70). An American Methodist Episcopal bishop. He was born at Portsea, England, came to America in 1818, and settled in Wooster, Ohio. He graduated in medicine from the University of Pennsylvania in 1829. After joining the Ohio conference in 1833 he was pastor at Norwalk and Sandusky. In 1836 he was stationed at Detroit. Later he was successively principal of Norwalk Seminary, editor of the *Ladies' Repository*, president of Ohio Wesleyan University (1846-60), and editor of the *Christian Advocate and Journal*, New York. Soon after he was elected Bishop in 1831 he made a world-wide survey of Methodist missions. He published: *Moral and Religious Essays* (1856); *Educational Essays* (1856); *Sketches, Biographical and Incidental* (1856); *Letters from Europe* (1856); *Our Oriental Missions* (1870); *Evidences of Revealed Religion* (1872).

THOMSON, EDWARD WILLIAM (1849-). A Canadian journalist, story writer, and poet. He was born in Peel County, Ontario. He served in the American Civil War in 1864-65, and for some years was a civil engineer on the Carillon Canal. Entering journalism, he was chief editorial writer on the *Toronto Globe* in 1879-91; went to Boston, where he was editor of the *Youth's Companion* (1891-1901); returned to Canada, became Ottawa correspondent of the *Boston Transcript*, and contributed to many periodicals. He published: *Old Man Savarin and Other Stories* (1895); *Walter Gibbs, the Young Boss, and Other Stories* (1896); *Between Earth and Sky* (1897); *Aucassin and Nicolette*, a versification of M. S. Henry's translation (1898); *Peter Ottawa* (1908); *When Lincoln Died and Other Poems* (1909); *The Many-Mansioned House and Other Poems* (1909).

THOMSON, ELIHU (1853-). An American electrical engineer. He was born in Manchester, England, and came to the United States in 1858. He was educated in the Philadelphia Central High School (A.B., 1870), where he was professor of chemistry and mechanics until 1880. Meanwhile he devoted much attention to the study of electricity, and lectured at Franklin Institute. In 1880 he became electrician to the Thomson-Houston Electric Company, which was organized by him, and subsequently he became

associated also with the General Electric Company. He devoted himself to inventions relating to arc lighting, incandescent lighting, motor work inducting systems, and especially electric welding. In recognition of his extensive contributions to applied science numerous honors were bestowed upon him: he was elected a member of the National Academy of Sciences and president of the American Institute of Electrical Engineers (1889), and was appointed Officer of the French Legion of Honor, received the Rumford medal of the American Academy of Arts and Sciences, grand prizes at Paris in 1889 and 1900 and at St. Louis in 1904, the Edison medal of the American Institute of Electrical Engineers, and others.

THOMSON, GEORGE (1757-1851). A Scottish composer, born at Limekilns, Fife. He was a constant and untiring collector of Scotch, Welsh, and Irish melodies, and had the most celebrated musicians of that period, among them Haydn and Beethoven, engaged in writing accompaniments for them. Each song contained a prelude, code, and ad libitum parts throughout for violin, flute, or cello. Among his works are: *A Select Collection of Original Scottish Airs*; *A Collection of Songs of Robert Burns, Sir Walter Scott, etc.* (1822); *Select Collection of Original Welsh Airs* (1809); and a *Select Collection of Original Irish Airs* (1814 to 1816); besides 20 Scottish melodies (1839). He died at Leith. Consult I. C. Hadden, *George Thomson* (London, 1898).

THOMSON, JAMES (1700-48). A Scottish poet, born at Ednam, in Roxburghshire, where his father was minister. After attending school at Jedburgh Abbey by the Tweed, he was sent to the University of Edinburgh (1715) with a view to the Church. Forsaking all thought of the ministry, he went to London to seek fame and fortune in poetry (1725). Though poor, he was well received by the Duke of Montrose and others, who helped him bring out *Winter* (1726). This was followed by *Summer* (1727) and *Spring* (1728). In 1730 appeared *Autumn*, bound with the previous poems under the title of *The Seasons*. These poems, issued separately and collectively, were from the first successful, and were exceedingly popular for a century. They marked the return of blank verse and a feeling for nature, of which there had been few traces since Milton. With *The Seasons* the literary historian dates the beginning of the romantic movement in English literature. Appointed in 1730 tutor to the son of Sir Charles Talbot, afterward Lord Chancellor, Thomson traveled for three years in France and Italy. On his pupil's death (1733) he returned to London and was appointed by the Lord Chancellor secretary of briefs, a sinecure, at a salary of £300 a year. He was now able to settle in a pretty cottage at Richmond. The death of his patron in 1737 ended his sinecure; but through Lyttelton he obtained from the Prince of Wales a pension of £100 (1738). He now revised *The Seasons*, enlarging greatly each poem. The new edition was published in 1744. In 1740 appeared *The Masque of Alfred*, written by Thomson and David Mallet and containing Thomson's famous ode, "Rule Britannia," the national patriotic hymn of England. At Richmond, too, was written Thomson's finest poem, *The Castle of Indolence* (1748). For it he employed the Spenserian stanza. The poem is exquisitely colored and reveals here and there rare gleams of imagination. Besides these sig-

nificant and beautiful poems, Thomson was the author of several tragedies, of which *Sophonisba*, produced at Drury Lane (Feb. 28, 1730), was the first, and *Tancred and Sigismunda*, produced at Drury Lane by Garrick (March 18, 1745), the most successful. His cenotaph was erected in Westminster Abbey by the side of Shakespeare's.

Translations and imitations of *The Seasons* were numerous in France and Germany. Thomson was thus a forerunner of the romantic revival, not only for England, but for the Continent.

Bibliography. The first collected edition of his *Works* was edited by George, Lord Lyttelton (4 vols., London, 1750); the best modern edition of his *Works* is the Aldine, edited with a biography by D. C. Tovey (ib., 1897). Consult also: Léon Morel, *James Thomson, sa vie et ses œuvres* (Paris, 1895); Lefèvre Deumier, in *Célébrités anglaises* (ib., 1895); Joseph Texte, *Cosmopolitisme littéraire au XVIIIème siècle* (ib., 1895; Eng. trans. by J. W. Matthews, New York, 1899); W. Bayne, *Life of James Thomson*, in the "Famous Scots Series" (Edinburgh, 1898); Samuel Johnson, "Thomson," in *Lives of the British Poets*, vol. iii, edited by G. B. Hill (Oxford, 1905); and G. C. Macaulay, *James Thomson* (New York, 1908). See ROMANTICISM.

THOMSON, JAMES (1822-92). A British physicist and engineer, the elder brother of William Thomson, Lord Kelvin (q.v.). He was born at Belfast and was educated at the University of Edinburgh. He settled as a civil engineer in Belfast, where in 1857 he was appointed professor of civil engineering in Queen's College. In 1873 he was elected professor in Glasgow University, succeeding W. J. M. Rankine (q.v.). He made many improvements in hydraulic machinery and predicted from theory the effect of pressure in lowering the freezing point of water. (See REGULATION.) His collected papers in physics and engineering, together with unpublished material, were edited by Sir Joseph Larmor and James Thomson, with a biographical sketch by J. T. Bottomley (Cambridge, Eng., 1912).

THOMSON, JAMES (1834-82). An English poet, born at Port Glasgow, Scotland. In 1840 his father was disabled by a paralytic stroke and two years later his mother died. He was educated at the Royal Caledonian Asylum (1842-1850) and then entered (1850) the Military Asylum, Chelsea, to qualify as an army schoolmaster. The next year he was sent as a teacher to Ballincollig, near Cork, where he fell in love with a beautiful girl, who died in 1853. After serving as schoolmaster at various other places, he was discharged from the service in 1862 for a trivial offense against discipline. Through the influence of his friend Charles Bradlaugh, he obtained a clerkship in London; and under the pen name of Bysshe Vanolis, or shortened to B. V. (Bysshe, the middle name of Shelley and Vanolis, an anagram of Novalis), he began writing for the radical magazines, and proved himself a vigorous and active champion of free thought. Except for a few months in the United States and as correspondent for the *New York World* in Spain (1873), he passed the last 16 years of his life in a one-room London lodging. He died an inebriate in University College Hospital. Thomson was a thorough-going pessimist wholly out of joint with the ways of men. He first attracted attention as a poet with his "City of Dreadful Night" (in the *National Reformer*, 1874, reprinted with other poems in 1880), a

lurid poem of great imaginative power. Hardly less impressive is the volume entitled *Vane's Story, Weddah and Om-el-Bonain, and Other Poems* (1881). The same year he collected some of his prose writings under the title *Essays and Phantasies*. After his death appeared *A Voice from the Nile, and Other Poems* (1884); *Satires and Profanities* (1884); and *Poems, Essays, and Fragments* (1892). Consult *Poetical Works*, edited with memoir by Bertram Dobell (London, 1895); also H. S. Salt, *Life of James Thomson* (ib., 1889); Bertram Dobell, in *Biographical and Critical Studies* (ib., 1896); P. E. More, *Shelburne Essays*, 5th series (New York, 1908).

THOMSON, JOHN (1778-1840). A Scottish landscape painter. He was born at Dailly, Ayrshire, and studied for a short time under Alexander Nasmyth. Destined for the church, and for 35 years minister at Duddingston, near Edinburgh, Thomson lacked systematic artistic training, but nevertheless he was the greatest Scottish landscape painter of his time and the first to render the true character of Scottish scenery. Among his finest paintings are "Aberlady Bay" and three other landscapes in the National Gallery, Edinburgh: "Fast Castle," "Castle Baan," and the "Graves of the Martyrs." He was an intimate friend of Sir Walter Scott.

THOMSON, JOHN ARTHUR (1861-). A British zoologist, born in East Lothian, and educated at the universities of Edinburgh, Jena, and Berlin. He was for a time lecturer on zoology and biology at Edinburgh University and was University Gifford lecturer at St. Andrews in 1915. Among his writings are: *Evolution of Sex* (1899; 3d ed., 1901), with Patrick Geddes; *The Study of Animal Life* (3d ed., 1896); *Outlines of Zoology* (6th ed., 1914); *The Science of Life* (1904); *Progress of Science in the Nineteenth Century* (1904); *Herbert Spencer* (1906); *Heredity* (1908; 2d ed., 1912); *The Bible of Nature* (1909); *Darwinism and Human Life* (1910); *The Biology of the Seasons* (1911); *Evolution* (1911), with Geddes; *Introduction to Science* (1911); *Sex* (1914), with Geddes; *The Wonder of Life* (1914).

THOMSON, JOSEPH (1858-95). A Scottish traveler and explorer. He was born in Dumfriesshire, and after studying at Edinburgh under Sir Archibald Geikie joined Keith Johnston's east central African expedition (1878), and after Johnston's death became leader in June, 1879. He reached Lake Tanganyika, and then started to go to the Congo, but was held back by his carriers. He discovered Lake Rukwa and afterward went to Bagamoyo on the coast, whence he sailed to London. He headed an expedition to Masai Land in 1882; went to Sokoto in behalf of the Royal Niger Company in 1885, when he secured a part of the Central Sudan to Great Britain; and, after exploring the Atlas Mountains in Morocco (1888), visited the region between lakes Nyassa and Bangweolo. In all his journeys he showed great tact and presence of mind and avoided serious conflict with the natives. He published *To the Central African Lakes and Back* (1881); *Through Masai Land* (1885; rev. ed., 1887); *Ulu: An African Romance* (1888), with Miss Harris-Smith; *Travels in the Atlas and Southern Morocco* (1889); and *Mungo Park and the Niger* (1890). He also wrote a large number of articles on his explorations, and on geographical and geological subjects. Consult J. B. Thomson, *Joseph Thomson, African Explorer* (London, 1896).

THOMSON, SIR JOSEPH JOHN (1856-). An English physicist. He was born near Manchester and was educated at Owens College in that city and at Trinity College, Cambridge, where he graduated with honors in 1880. In 1884 he became Cavendish professor of experimental physics at Cambridge, and in 1905 was appointed professor of physics in the Royal Institution. At Princeton University in 1896 he delivered a series of lectures, published in 1897 as *Discharge of Electricity through Gases*. In 1903 he again visited the United States, where he received honorary degrees from Columbia, Princeton, and Johns Hopkins. Thomson was awarded medals by the Royal Society, the Hodgkins medal of the Smithsonian Institution (1902), and the Nobel prize in physics for 1906. He was knighted in 1908 and received the Order of Merit. To Thomson, more than to any one else, is due the development of the modern ionic theory of electricity, the theoretical and experimental discussion of radioactivity, and the electrical theory of inertia of matter. His papers on these subjects were epoch making. (See X RAYS.) In 1914 he delivered at Oxford the Romanes lecture, which appeared as *The Atomic Theory*. He published also: *On the Motion of Vortex Rings* (1883); *Application of Dynamics to Physics and Chemistry* (1888); *Recent Researches in Electricity and Magnetism* (1893); *Elements of the Mathematical Theory of Electricity and Magnetism* (1895); *Conduction of Electricity through Gases* (1903); *Electricity and Matter* (1904), Silliman lectures at Yale; *Corpuscular Theory of Matter* (1907); *Rays of Positive Electricity and their Application to Chemical Analyses* (1913); *Thermochemistry* (1915). With J. H. Poynting (q.v.) he wrote *A Treatise on Physics* (1899-1914). In another field Thomson identified himself with the Society for Psychical Research.

THOMSON, THOMAS (1773-1852). A Scottish chemist, born at Crieff, Perthshire. He was educated at St. Andrews and at Edinburgh. As early as 1802 he published a *System of Chemistry*. In 1817 he was appointed lecturer, and in 1818 regius professor of chemistry at the University of Glasgow. Thomson was the first to publish (*System of Chemistry*, 3d ed., 1807) a detailed account of Dalton's atomic theory, which had been communicated to him in a private interview (1804) and which Dalton himself did not publish until 1808. He was also the first English chemist to give laboratory instruction to students. His works include: *Elements of Chemistry* (1810); *An attempt to Establish the First Principles of Chemistry by Experiment* (1825; the analytical data of the elements were shown by Berzelius to be far from accurate); *Chemistry of Organic Bodies* (1838); *History of Chemistry* (1830-31); *History of the Royal Society* (1812); *Outlines of Mineralogy and Geology* (1836).

THOMSON, SIR WILLIAM. See KELVIN, WILLIAM THOMSON, first BARON.

THOMSON, WILLIAM MCCLURE (1806-94). An American Presbyterian missionary and writer. He was born in Springfield (now Spring Dale), Ohio, and graduated at Miami College (1826); studied at Princeton Theological Seminary; and went as a missionary of the American Board to Syria and Palestine (1833). The next year he went to Beirut and there resided till his return to America in 1876. His reputation rests upon his familiar work, *The Land and the Book*,

Biblical Illustrations Drawn from the Manners and Customs, the Scenes and the Scenery of the Holy Land (1859; 2d ed., 3 vols., 1880-85; re-issue, 1 vol., 1911).

THOMSON EFFECT. A thermal effect in an electric circuit where the temperature of the wire carrying the current varies from point to point. When the current is flowing in one direction along such a conductor, heat will be liberated at a given point, whereas if the current is reversed the heat at this point will be absorbed. The relative direction of the current and the absorption or liberation of heat depend upon the metal. See THERMOELECTRICITY.

THOMSONITE, tòm'sūn-it. See CHLORAS-TROLITE.

THOR, thôr (Icel. *þórr*, thunderer; cf. Lat. *tonare*, Ger. *donner*). In Scandinavian mythology, the god of thunder. He was the son of Odin and Frigg, while his wife was Sif the Delighter. His palace, where he received the warriors who had fallen in battle, was called Bilskirnir. Thunder was caused by the rolling of his chariot, which was drawn by he-goats. He was in the vigor of youth, had a red beard, and was the strongest of all the gods. He was a terror to the giants, with whom he was perpetually at strife, and whom he struck down with his hammer Mjölnir, or the smasher, which returned to his hand after being hurled. In the contest at the twilight of the gods Thor slew the serpent of Midgard, but fell at the same time poisoned by the venom exhaled from its mouth. The name of Thor was widespread. The Saxons worshiped him as Thunar, and Torden, the wrathful deity dreaded by the Lapps, is evidently the Scandinavian Thor. The Gallic god Taranis, or Tannarus, appears also to be identical. Of all the Æsir (q.v.), Thor had unquestionably the most worshipers. In Norway he was the national god, and there, as in Iceland, temples were almost exclusively erected to him. Offerings were made to him, particularly in times of pestilence. Thursday was named for him. The heathen Scandinavians marked their rune stones with the sign of the hammer of Thor. See RAGNARÖK; SCANDINAVIAN AND TEUTONIC MYTHOLOGY.

THORACIC (thō-rās'ik) **DUCT** (from Lat. *thorax*, from Gk. *thōrak*, breastplate, part of the body covered by the breastplate, thorax). A canal equal in diameter to a goose quill, proceeding from the receptaculum chyli (into which the contents of the lacteals are collected, and which is situated in the front of the body of the second, lumbar vertebra), which ascends along the front of the vertebral column, between the aorta and ascending vena cava, as high as the fourth dorsal vertebra; it then inclines to the left, and passing behind the arch of the aorta, ascends as high as the seventh cervical vertebra, when it bends forward and downward, and empties into the subclavian at its junction with the internal jugular vein of the left side, where it is provided with a pair of semilunar valves, which prevent the admission of venous blood into it. It is also provided with other valves on its upward course. It is the common trunk of all the lymphatic vessels of the body, excepting those of the right side of the head, neck, thorax, the right upper extremity, the right lung, right side of the heart, and the upper surface of the liver, the lymphatics of which empty into the right lymphatic duct, a vessel less than an inch long, which pours its contents into the right subclavian or internal jugular

vein. This duct is not liable to any special diseases, but if its function of conveying chyle from its source into the general circulation be interfered with, by injury, hemorrhage, or inflammation, or by the pressure of a tumor, nutrition is impaired and there may be an accumulation of chylous fluid in the peritoneal cavity or pericardium or pleura, or there may be chyluria, or chylous oedema of the pelvis, genitals, or lower abdominal wall.

THORAH. See TORAH.

THORAX. See CHEST.

THORBECKE, tōr'bēk-e, HEINRICH (1837-90). A German Arabic scholar. He was born at Meiningen, and studied at Munich and Leipzig. He was appointed professor at Heidelberg (1873) and at Halle (1885). He is especially noted for his knowledge of Arabic poetry. He published: *Antarah, ein vorislamitischer Dichter* (1867); *Al-Hariri's Durrat-al-gawwas* (1871); *Al-A'schā's Lobgedicht auf Mahammed* (1875); *Ibn Duraid's Kitāb al-malahin* (1882); *Die Mufaddali-jūt* (1885); *Mihail Sabbag's Grammatik der arabischen Umgangssprache in Syrien und Aegypten* (1886).

THOREAU, thō'rō or thō-rō', HENRY DAVID (1817-62). An American naturalist and author, of French and Scotch extraction, born at Concord, Mass., where his father was a manufacturer of lead pencils. At this trade the younger Thoreau worked at intervals. He graduated from Harvard in 1837, and was for five or six years engaged in school teaching and tutoring in Concord and at Staten Island, N. Y. Preferring to live a life of contemplation, he abandoned teaching and proceeded, during the rest of his days, to demonstrate how simply and agreeably a man might live. He was for a time an inmate of Emerson's house, but his most characteristic act was his residence, from July, 1845, to September, 1847, in a hut on the shores of Walden Pond, a beautiful body of water on the outskirts of Concord. Here he lived, doing what little work was necessary to supply the necessities of life, and devoting the major part of his time to the study of nature and to the society of friends. On leaving Walden he again lived with Emerson, 1847-48, and the years after 1849 were spent with his parents and sister at Concord. During his life at Walden Pond and elsewhere in Concord, he supported himself by odd jobs of gardening, land surveying, carpentering, etc., but without more exertion than he needed to keep himself in food and clothing. His leisure time he devoted to the study of nature, to the reading of Greek, Latin, French, and English classical literature, to excursions, to pondering metaphysical problems, and to friendly chat with his neighbors, by whom he was beloved.

From 1837 till his death he kept a journal, and this furnished the source and basis of his writings, and gave them uniformity of character. Of the volumes which comprise his works in the standard Riverside edition (11 vols., with the *Familiar Letters* of Thoreau edited by F. B. Sanborn) but two appeared in his lifetime. The first of these, *A Week on the Concord and Merrimack Rivers* (1849), is the narrative of a boating trip taken in August, 1839; it is full of admirable description and minute observation of nature, mingled with excursions into transcendental philosophy. The second book records the experiences, physical and moral, of his two years at Walden Pond: *Walden, or, Life in the Woods* (1854), perhaps his most popular volume, rec-

ognized as one of the most original and sincere productions in American letters and as one of the most genuine of woodland books. It gives a plain unaffected statement of the reasons for the author's life as a hermit, and an admirably specific account of the main details of that life. The other volumes, largely made up of material from his journal, and edited and published posthumously, are: *Excursions* (1863); *The Maine Woods* (1864); *Cape Cod* (1865); *Early Spring in Massachusetts* (1881); *Summer* (1884); *Winter* (1888); *Autumn* (1892); and *Miscellanies* (1894). In 1905 appeared *The First and Last Journeys of Thoreau, lately discovered among his unpublished Journals and Manuscripts* (ed. by F. B. Sanborn, Boston). A new and complete edition was published in 1906. Their publication indicated an increasing interest in Thoreau and a sense of the permanent value of his work. The literary quality of the writing was high; he had a marked gift for style, and wrote with great care and unflinching freshness. His best essays, to be found in the volumes entitled *Miscellanies* and *Excursions*, are perhaps not excelled in American literature, whether for substance or for style, and it may be doubted whether the work of any of his contemporaries is wearing as well. His poems are interesting, but occupy a minor place in his writings.

Bibliography. A. H. Japp, *Thoreau: His Life and Aims* (Boston, 1877); H. S. Salt, *Life of David Henry Thoreau*, in "Great Writers Series" (New York, 1896); F. B. Sanborn, *Henry D. Thoreau*, in "American Men of Letters" (Boston, 1896); A. R. Marble, *Thoreau: His Home, Friends, and Books* (New York, 1902); W. E. Channing, *Thoreau: The Poet-Naturalist* (new ed., Boston, 1902); R. W. Emerson, in *Biographical Studies* (Centenary ed., ib., 1903); Bradford Torrey, in *Friends on the Shelf* (ib., 1906); Arthur Rickett, *The Vagabond in Literature* (New York, 1906); P. E. More, in *Shelburne Essays, First and Fifth Series* (ib., 1907-08); W. M. Payne, in *Leading American Essayists* (ib., 1910).

THORESEN, tō'rā-sen (ANNA) MAGDALENE (KRAGH) (1819-1903). A Norwegian poet, born at Fredericia, in Denmark. She married a Norwegian clergyman and gained opportunity to study the peasant life and wilder nature of that country. Her sympathetic observations found literary expression in *Fortællinger* (Tales, 1863); *Signes Historie* (1864); *Solen i Siljedalen* (1868); *Billeder fra Vestkysten af Norge* (Pictures from the West Coast of Norway, 1872); *Nyere Fortællinger* (1873); *Herluf Nordal* (1879); she published also two volumes of poems (1860 and 1887); several dramas, among them *Et Rigt Parti* (1870), the story *Billeder fra Midnatsolens Land* (2 vols., 1884-86); and a final volume of tales (1899). Her earlier fiction was translated into German by Reinmar: *Gesammelte Erzählungen* (5 vols., Berlin, 1878-1883). Consult her biography by Clara Bergsøe (Copenhagen, 1904).

THORGILSSON, ARI. See ARI THORGILSSON.

THO'RITE. A mineral thorium silicate crystallized in the tetragonal system. It has a vitreous lustre, and is orange yellow to dark brown in color. It is found at various places in Norway, where, owing to the uranium oxide that it contains, it is called *uranothorite*.

THORIUM (Neo-Lat., from *Thor*, Scandinavian god of thunder). A metallic element discovered by Berzelius in 1828. It occurs in mona-

zite, orangite, thorite, and other minerals containing the cerium group of metals, and found in Brazil, Norway, and in North and South Carolina. For the extraction of thorium, monazite sand is heated with strong sulphuric acid, then cold water is added, and the resulting solution is separated from the insoluble residue and partially precipitated with alkali; the precipitate is dissolved in hydrochloric acid, and from this acid solution the thorium is precipitated, in the form of its oxalate, with oxalic acid. The metal itself may be obtained by decomposing thorium chloride with potassium or sodium. Thorium (symbol, Th; atomic weight, 232.4) is a gray powder which assumes an iron-gray lustre when burnished. It has a specific gravity of about 11 and takes fire when heated in air, burning with a bright flame. It combines with oxygen, forming a white dioxide (ThO₂), called thoria, and a peroxide. None of the compounds of thorium have any important commercial value except the dioxide, which has been used with ceria in the mantle of the Welsbach burner. Thorium is a distinctly radioactive element, its gradual disintegration producing a series of elements of more or less ephemeral existence, like the series yielded by radium. See RADIOACTIVITY.

THORN. See CRATÆGUS.

THORN, tōrn. A strongly fortified town of Prussia, in the Province of West Prussia, on the right bank of the Vistula, which here divides into two branches, 87 miles northeast of Posen (Map: Germany, H 2). There are many antique houses with striking architectural features. The ruins of a castle of the Teutonic Order, the church of St. John (1231-60), the Gothic St. James (1309), and the Marienkirche (1367) are worthy of notice, also a town hall with museum, library, and archives. In the market place stands a bronze statue of Copernicus, who was born here. There are iron foundries, and machine, tobacco, and soap works. The town carries on trade by water and rail in corn, lumber, mineral waters, chocolate, gingerbread, and alcohol. Thorn was founded in 1231 by the Knights of the Teutonic Order. It became an important member of the Hanseatic League. It was annexed in 1454 to Poland. In 1466 a treaty of peace was concluded here between Poland and the Teutonic Knights (q.v.). The town became a part of Prussia in 1793. Pop., 1900, 29,626; 1910, 46,227. In the early part of the Great War which began in 1914 Thorn was bombarded and seriously threatened by the Russians. (See WAR IN EUROPE.) Consult Kestner, *Beiträge zur Geschichte der Stadt Thorn* (Thorn, 1883).

THORN, CHRIST'S. See JUJUBE.

THORNABY (thōr'nā-bī) ON TEES, formerly SOUTH STOCKTON (Map: England, E 2). A municipal borough in the North Riding of Yorkshire, England, suburban to Stockton, with which its manufacturing industries and public works are identified. It is mentioned as Thormodby in Domesday. Pop., 1901, 16,053; 1911, 18,605.

THORN ACACIA. See LOCUST TREE.

THORN APPLE. See STRAMONIUM.

THORNDIKE, ASHLEY HORACE (1871-). An American English scholar, brother of Edward L. Thorndike. He was born at Houlton, Me., and graduated at Wesleyan University in 1893, later taking higher degrees at Harvard. After serving as principal of Smith Academy, Hatfield, Mass., and teaching at Boston University and at Western Reserve, he held a chair

at Northwestern (1902-06), and served thereafter as professor of English at Columbia. He wrote: *Influence of Beaumont and Fletcher on Shakespeare* (1901); *Elements of Rhetoric and Composition* (1905); *Tragedy* (1908); *Everyday English* (1913); *Shakespeare's Theatre* (1916).

THORNDIKE, EDWARD LEE (1874-). An American psychologist, brother of Ashley H. Thorndike. He was born at Williamsburg, Mass., and graduated from Wesleyan University in 1895, from Harvard in 1896, and from Columbia (Ph.D.) in 1898. In 1898-99 he taught at Western Reserve University, and afterward was identified with Teachers College, Columbia, where by 1904 he had become professor of educational psychology. In 1912 he was president of the American Psychological Association. Besides monographs and articles, he published: *The Human Nature Club* (1901); *Educational Psychology* (1903; 3d ed., 3 vols., 1913-14); *Mental and Social Measurements* (1904; 2d ed., rev., 1913); *The Elements of Psychology* (1905); *Principles of Teaching* (1905); *Animal Intelligence* (1911); *Education: A First Book* (1912); *The Measurement of Ability in Reading* (1914); *Educational Psychology, Briefer Course* (1914).

THORNE, WILLIAM JAMES (1857-). An English labor leader and Socialist, born at Birmingham. He began to work when six years old. He founded the National Union of Gas-workers and General Laborers in 1889, and thereafter was its general secretary. He was elected in 1890 to the town council of West Ham, of which he was deputy mayor in 1898, and he entered the House of Commons in January, 1906.

THORN HILL. A town in the West Riding of Yorkshire, England, 1½ miles south of Dewsbury. It is a prosperous woolen-milling town and also manufactures carpets and shoddy. Pop., 1901, 10,290; 1911, 10,974.

THORNTON, SIR EDWARD (1817-1906). An English diplomat. He was born in London and was educated at King's College, London, and at Pembroke College, Cambridge. He entered the diplomatic service as attaché to the mission at Turin in 1842, filled the same position in Mexico in 1845, and was made Secretary of Legation in that capital in 1853. During 1848 he did much to forward the conclusion of the important Treaty of Guadalupe Hidalgo. In 1852 he was appointed Secretary of Legation at Buenos Aires; chargé d'affaires to Uruguay (1854); Minister to the Argentine Republic in 1859, to Brazil in 1865, and from 1867 to 1881 to the United States. He was knighted in 1870; in 1871 was a member of the commission on the Alabama Claims, and was appointed Privy Councillor; and in 1873 was arbitrator in the commission on the Mexican and United States claims. He was appointed Ambassador at St. Petersburg in 1881, Ambassador at Constantinople in 1884, and retired to private life in 1887.

THORNTON, JOHN WINGATE (1818-78). An American historian, born at Saco, Me. He graduated at the Harvard Law School in 1840, and became a practicing lawyer. His great interest, however, lay in genealogical and historical work, and he published a number of books along these lines, including: *The Landing at Cape Ann* (1854); *The First Records of Anglo-American Colonization* (1859); *The Pulpit of the American Revolution* (1860). He was the founder of the New England Historical and Genealogical Society (1844). Consult Amory, *Memoir of J. W. Thornton* (Boston, 1879).

THORNTON, MATTHEW (1714-1803). A signer of the Declaration of Independence. He was born in Ireland; went to America in 1717, lived at Wiscasset, Me., and later at Worcester, Mass., where he was educated; settled as a physician at Londonderry, N. H., and was surgeon under Sir William Pepperell in the Louisburg expedition of 1745. He was president of the provincial convention of 1775, and in 1776 was a delegate to the Continental Congress, taking his seat in November, when he was allowed to sign the Declaration of Independence, though not elected until after its passage. He was Chief Justice of the Court of Common Pleas prior to 1776, and from 1776 to 1782 was a judge of the New Hampshire Supreme Court.

THORNTON, WILLIAM (1762-1828). An American architect, born on Tortola Island in the West Indies. He was without technical training, but cultivated the study of classic architecture as a gentleman amateur, and in 1793 submitted plans for the proposed Capitol at Washington to the Commissioners of the District of Columbia. These plans were approved by President Washington, and their execution was begun under the superintendence of Stephen Hallet, a Frenchman, and James Hoban (q.v.); but in 1794 Thornton, who had come to the United States meanwhile, was appointed a commissioner of the District, and in that capacity until 1802 supervised the work. His design, though later modified in detail, survives in the central block of the Capitol, in spite of the fire of 1814. He also designed the "Octagon" mansion at Washington. From 1802 until the time of his death Thornton held the office of Commissioner of Pensions.

THORNWELL, JAMES HENLEY (1812-62). An American Southern Presbyterian theologian. He was born in Marlborough District, S. C., and graduated at South Carolina College, Columbia, in 1829. He held several pastorates; was for a time president of South Carolina College, and held professorships in the theological seminary at Columbia. He published *Arguments of Romanists Discussed and Refuted* (1845), *Discourses on Truth* (1854), *On the Rights and Duties of Masters* (1861), *The State of the Country* (1861), and was one of the most orthodox and conservative of theologians. His collected writings were published at Richmond (1871-73). Consult his *Life and Letters* by B. M. Palmer (Richmond, 1875) and J. L. Girardeau (1871-73).

THORNYCROFT, SIR JOHN ISAAC (1843-). An English naval architect, brother of William Hamo Thornycroft. He was born in Rome. Early showing an aptitude for mechanics, at 18 he built a steam launch, the *Nautilus*, which was the fastest boat of its kind on the Thames. Earlier, he had constructed a little model steamer which contained several important innovations afterward introduced by him into his torpedo boats. After completing the engineering course at the University of Glasgow, he opened a shipyard at Chiswick in 1866, and achieved remarkable success as a builder of torpedo boats. Among his improvements were the closed stoke-hole and fan, a special indicator, a water-tube boiler, and the turbine propeller. He contributed to the *Transactions of the British Association* and to the publications of the Institution of Naval Architects (of which he became vice president) and the Institution of Civil Engineers. In 1902 he was knighted.

THORNYCROFT, WILLIAM HAMO (1850-1925). An English sculptor, the son of Thomas Thornycroft (1815-85), a sculptor of classical tendencies, and Mary Thornycroft, a pupil of John Gibson, who carved many statues and busts of the royal family for Queen Victoria. He was born in London and studied with his father, at the Royal Academy Schools, and also in Italy. He first won recognition with his "Warrior Bearing a Wounded Youth" (1876). His ideal figures were at first conceived in a strongly classic spirit with much beauty and purity of taste. To this style belong such works as "Lot's Wife" (1878); "Artemis" (1880, Duke of Westminster, Eaton Hall, Chester); "Teucer," perhaps his masterpiece (1881, Tate Gallery, London), and "Medea" (1888). He afterward became more modern in treatment and spirit, as may be seen in the "Mower" (1884, Liverpool Gallery), and the "Sower" (1886). Among his many public monuments, the most notable include the Stanley Memorial (1898, Holyhead Church); the General Gordon monument in Trafalgar Square, London; the statue of Queen Victoria in the Royal Exchange; Bishop Goodwin of Carlisle (1895, Carlisle Cathedral); Cromwell (1900, Westminster); the colossal "King Alfred" (1901, Winchester); the Gladstone Monument (Strand, London); the Armstrong Memorial (Newcastle); and the statue of Tennyson (1909, Trinity College, Cambridge). He also executed some notable work in relief and in decorative sculpture. Thornycroft was elected a member of the Royal Academy (1888), honorary member, Royal Academy of Munich (1889), and received gold medals at the Royal Academy (1875) and in Paris (1900). See **THORNYCROFT, SIR JOHN ISAAC**.

THÓRODDSEN, thór'ód-sen, JÓN THORDARSON (1819-68). An Icelandic poet and novelist, born at Reykhólar. After studying law at the University of Copenhagen, he took part in the war against the Schleswig-Holstein insurgents and in 1850 returned to Iceland. He died at Borgarfjarðarsýsla. In point of both time and excellence, Thóróddsen is the first Icelandic novelist. His best-known works are his first novel, *Piltur og Stúlka* (Lad and Lass) (1850; many editions; Ger., Dan., and Dutch trans.), and *Mathur og Kona* (Man and Wife), published posthumously (1876). These books are characterized by a faithful delineation of Icelandic life and by a quaint and pleasing humor. Thóróddsen also wrote a number of witty and satirical poems, published in 1871. Consult Poestion, *Isländische Dichter der Neuzeit* (1897).

THOROLD, thór'öld. A town in Welland County, Ontario, Canada, on the Welland Canal and on the Grand Trunk and the Niagara, St. Catharines, and Toronto Electric railways (Map: Ontario, F 7). It has a public library. There are various manufactures. Pop., 1901, 1979; 1911, 2273.

THOR'OLD, ANTHONY WILSON (1825-95). An English bishop. He was born at Hougham in Lincolnshire; graduated at Queen's College, Oxford, in 1847; entered the ministry, and filled prominent livings in London from 1857 till he became Bishop of Rochester in 1877. In 1890 he was transferred to Winchester. He is best known as the author of the devotional works, of rare spirituality: *The Presence of Christ* (1869); *The Gospel of Christ* (1882); *The Yoke of Christ* (1884); *Questions of Faith and Duty* (1892); *The Tenderness of Christ* (1894). Consult his *Life by Simpkinson* (London, 1896).

THOROUGHBASS. See **FIGURED BASS**.

THOROUGHWORT. See **BONESET; EUPATORIUM**.

THORPE, BENJAMIN (1782-1870). An English philologist who studied at Copenhagen under the famous philologist Rasmus Kristian Rask (q.v.). While there he published a translation of Rask's *Anglo-Saxon Grammar* (1830; rev., 1865). Returning to England (1830), he continued his studies in Old English and Old Norse. Most widely known in his *Northern Mythology, comprising the principal popular Traditions and Superstitions of Scandinavia, North Germany, and the Netherlands* (3 vols., 1851). This was supplemented by *Yule Tide Stories: A Collection of Scandinavian Tales* (1853) and a translation of the *Edda of Sæmund the Learned* (1866). Thorpe's pioneer work in Old English translation, philology, and history is still of great value. Among his publications in this department are *Cædmon's Metrical Paraphrase* (1832); *Analecta Anglo-Saxonica* (1834; 3d ed., 1868); *Ancient Laws and Institutes of England* (1840); *Code of Exoniensis, a Collection of Anglo-Saxon Poetry, with English Translation and Notes* (1842); *Anglo-Saxon Poems of Beowulf, with a Literal Translation, Notes, and Glossary* (1855); *The Anglo-Saxon Chronicle, according to the several Original Authorities* (2 vols., 1861); and *Diplomatarium Anglicum Ævi Sæonici: A Collection of English Charters from 605 to 1066* (1865).

THORPE, SIR EDWARD (1845-1925). An English chemist. He was born near Manchester and was educated at Owens College, where he came under the influence of Sir Henry E. Roscoe (q.v.). Later he studied at Bonn and Heidelberg (Ph.D.). He was professor successively in the Andersonian Institution, Yorkshire College, Leeds, and the Royal College of Science, London. In 1909 he was knighted. At various times he served as president of the Society of Chemical Industry, the Chemical Society of London, and the chemical section of the British Association. Besides many addresses and important papers he published: *Chemical Problems* (1870); *Qualitative Analysis* (1873); *Quantitative Analysis* (1873); *Inorganic Chemistry* (2 vols., 1874); *A Dictionary of Applied Chemistry* (3 vols., 1893; 5 vols., 1912); *A History of Chemistry* (2 vols., 1909-10).

THORPE, FRANCIS NEWTON (1857-). An American historian, born at Swampscott, Mass. He was educated at Syracuse University and at the Law School of the University of Pennsylvania. From 1885 until 1898 he was fellow, and professor of American constitutional history, at the University of Pennsylvania. In 1910 he accepted the chair of political science and constitutional law at the University of Pittsburgh. He published: *The Government of the People of the United States* (1889); *A Constitutional History of the American People, 1776-1850* (2 vols., 1898); *The Constitutional History of the United States, 1765-1895* (3 vols., 1901); *Short Constitutional History of the United States* (1904); *An American Fruit Farm* (1915). He edited *The History of the Civil War—National View* (1906) and *The Statesmanship of Andrew Jackson* (1909).

THORPE, ROSE HARTWICK (1850-). An American author, born at Mishawaka, Ind. In 1871 she was married to E. Carson Thorpe. She became best known for her ballad *Curfew Must Not Ring To-Night* (1882). The *Poetical*

Works of Rose Hartwick Thorpe were published in 1912. In addition to verse she wrote several stories.

THORVALDSEN, tôr'wâld-sën (Ger. THORWALDSEN), BERTEL (1770-1844). An eminent Danish sculptor, the most important and gifted exponent of classicism in sculpture (q.v.) in the nineteenth century. He was born at Copenhagen, Nov. 19, 1770, the son of an Icelandic carpenter and carver of figures upon galleons. He was sent to the academy at the age of 11, and received, in 1793, the great gold medal, with a stipend for three years' study at Rome. This city, however, he did not reach until March, 1797. In Rome he was less influenced by the master works of antiquity than by Carstens (q.v.) who had already been his model at Copenhagen. On the point of returning home, in 1803, he received a commission from Sir Thomas Hope to execute in marble the colossal statue of "Jason with the Golden Fleece," the plaster cast of which had called forth the admiration of all connoisseurs and critics, and even of Canova. Orders now came in abundance, especially after he had finished the spirited relief of the "Abduction of Briseis," one of his most perfect creations in the realm of relief sculpture. In 1804 he produced the famous group of "Cupid and Psyche," and the relief of "Dance of the Muses on Mount Helicon," and in 1805 the statues of "Apollo," "Bacchus," and "Ganymede," which was later followed by a "Ganymede Filling the Cup," and the graceful group of "Ganymede Watering the Eagle of Zeus." With his increasing reputation came new distinctions and honors; in 1804 the Florence Academy appointed him professor and in 1808 he was elected a member of the Accademia di San Luca in Rome, sending as his reception piece the relief "A Genio Lumen." About 1809 Thorvaldsen won a new patron in Crown Prince Louis of Bavaria, who sought his advice in purchasing antique works of art and commissioned him to execute a statue of "Adonis" (1832, Glyptothek, Munich).

To the year 1809 belong four of his most attractive reliefs, the group of "Hector, Paris, and Helena," and three other mythological subjects, and in 1810-11 he carved the life-size statue of "Psyche," one of his creations approaching nearest to the spirit of antique art, and a heroic-sized "Mars Weighing Cupid's Arrows." In honor of the proposed visit of Napoleon to Rome he was commissioned to model a frieze representing the "Entry of Alexander the Great into Babylon," with which he achieved prodigious success. The marble version found a permanent home in the Villa Carlotta on Lake Como, and a modified replica was acquired by the Danish government for Kristiansborg Castle. From a purely artistic point of view the "Memorial to Baroness Schubart" (1814) is most akin to the Greek reliefs of the fourth century B.C., and of his compositions dating from 1814-15, the medallions of "Morning" and "Night" have probably given him the widest reputation. In 1816-18 he produced "Venus with the Apple," "Hebe," "Cupid Triumphant," "Bacchante Dancing," "Shepherd Boy Resting," "Mercury, Slayer of Argus," and "The Three Graces." The latter subject he treated even more successfully in the high relief for the tomb of the Milanese painter Appiani. A series of charming reliefs with Cupid as the central figure date from the same period. The year 1819 saw the realization

of the unique "Lion of Lucerne," a memorial to the Swiss guards who fell guarding Versailles Palace, chiseled out of the natural rock by the Swiss sculptor Ahorn after Thorvaldsen's model.

Arriving at Copenhagen in October of the same year, he was received with great honors. He received a commission for the plastic decoration of Vor Fruekirke (Church of Our Lady), with figures, groups, and reliefs, executed subsequently in Rome. They comprise the colossal statue of "Christus Consolator," one of his masterpieces, the statues of the "Twelve Apostles," and the reliefs of the "Institution of Baptism" and of the "Institution of the Holy Communion." The Christ was finished by his own hand, the others with the assistance of his pupils after his return to Rome. He left Copenhagen in 1820 and, having arranged at Warsaw for the erection of his equestrian statue of Prince Poniatowski and the Copernicus Monument, returned to Rome, where he devoted himself zealously to his new commissions. To these were added the "Monument to Pope Pius VII" in St. Peter's (1831), and the statue of Lord Byron (1835, Trinity College, Cambridge). A statue of "Hope" (1829) adorns the tomb of the Humboldt family in the park at Tegel, near Berlin.

In 1825 Thorvaldsen was elected president of the Accademia di San Luca in Rome, notwithstanding the objections to him as a Protestant. Important works, other than those already mentioned, are the statue of Duke Eugene of Leuchtenberg, in St. Michael's Church, Munich, and the equestrian statue of the "Elector Maximilian I" (Munich), the first instance in which he represents an historical personage in the costume of the time. This was done most successfully in the statue of Conradin, Last of the Hohenstaufen, in Santa Maria del Carmine, at Naples. Besides reliefs of antique subjects, he produced in the thirties the figure of a "Young Dancer" (1837, Palazzo Torlonia) and a colossal statue of "Vulcan," one of his last works at Rome.

His return, consequent upon the King's request, was made in a royal Danish frigate. Besides his monumental tasks for the Fruekirke, it was principally reliefs from Greek mythology that now claimed his attention, and in the spring of 1841 he repaired once more to Rome to finish some subjects he had left behind. His journey through Germany was a triumphal progress, and after one year in Rome he returned to Copenhagen, devoting himself to work in relief. The pieces known as "Christmas Joy in Heaven," "The Rape of Hylas," and the famous "Four Seasons" are the most remarkable. He died at the theatre, on March 24, 1844, and was escorted to his burial place with princely honors. His possessions were bequeathed to his native city for the establishment of the Thorvaldsen Museum, in which all his works, in the original or in plaster models, his sketches and studies, and his art collections are preserved, and in the court of which he lies buried. His art is the best which the so-called classicist tendency has produced in sculpture. Unlike Canova, his inspiration was Greek rather than Roman, and his works approach nearest of all to the purity and repose of Greek art. He excelled especially in relief and in ideal and mythological subjects. As he sought chiefly to attain general types, his art was deficient in characterization, and also in dramatic action.

Lücke, "Canova und Thorvaldsen," in Dohme, *Kunst und Künstler des neunzehnten Jahrhunderts*, vol. i (Leipzig, 1886); Julius Lange, *Thorvaldsen's Darstellung des Menschen*, German translation by Mathilde Mann (Berlin, 1894); Adolf Rosenberg, "Thorvaldsen," in *Künstler-monographien*, No. 16 (Bielefeld, 1901).

THOS, thōz. A tall, non-Mongoloid people of Tonking, in the valley of the Claire River, with subbrachycephalic head form, a member of the Moïs (q.v.) group of tribes. They are husbandmen, living in houses on piles, and wearing a very picturesque costume. The Thos and the Muongs (q.v.) of the valley of the Black River in Tongking may be regarded as one of the principal groups of the Thai stock, to which belong the Shans (q.v.), the Laotians (see LAOS), and the Siamese. Consult Garcin, *Un an chez les Muongs au Tonkin* (Paris, 1891); De Lanesan, *L'Indo-Chine française* (ib., 1889); Pinabel, *Sur quelques peuples sauvages dépendant du Tong-King* (ib., 1884).

THOTH, thōth or tōt (Gk. Θῶθ, *Thōth*, Θωθ, *Thōyth*, Θεθ, *Theyth*, from Egypt. *Dhuti*). An Egyptian deity identified by the Greeks with Mercury (q.v.). Consult E. A. T. Wallis Budge, *The Gods of the Egyptians* (London, 1904). See HERMETIC and PLATE of EGYPTIAN DEITIES.

THOTHMES, thōth'mēz or tōt'mēs (Egypt. *Dhuti-mose*, son of Thoth; Gk. *Τούθμωσις*, *Touthmōsis*) or TAHUTIMES. The name of four kings of Egypt of the eighteenth dynasty.

THOTHMES I was the son and successor of Amenophis I (q.v.) and ascended the throne about 1560 B.C. According to Manetho, as cited by Africanus, he reigned for 22 years, though no date higher than his ninth regnal year has as yet been found upon the monuments. The first recorded military expedition of Thothmes I was against the Nubians, whom he defeated, returning in triumph to Thebes with the body of their chief at the bow of his ship. In his third year he found it necessary to chastise the Nubian tribes in another expedition. Not long after, he invaded Asia and, marching as far as the Euphrates, set up a stele which was later seen and mentioned by Thothmes III. The remainder of his reign seems to have been peaceful and was largely devoted to building operations. At Karnak (q.v.) he built two pylons and two hypostyle halls, and erected two obelisks, one of which (76 feet high) is still standing. (See OBELISK.) He also constructed buildings in the necropolis of Thebes, at Abydos, at Ibrim (a rock-hewn chapel), and at other places. The coffin of Thothmes I was found in 1881 at Deir el Bahri, but whether the mummy it contained is that of the King is not altogether certain.

THOTHMES II, the son and successor of Thothmes I, reigned for about nine years, according to the monuments, and according to Manetho for 12 or 13 years. An inscription at Assuan, dated in the first year of his reign, states that he sent an expedition against Nubian tribes who had raided his territory, and he seems to have fought against the Asiatic Bedouin, but

he undertook no extensive wars. He made additions to the great Temple of Ammon at Karnak, and his name is inscribed upon buildings in many parts of Egypt. The mummy of the King, found in 1881 at Deir el Bahri, is that of a young man, apparently not over 30 years of age. His sister and wife, the able and energetic Hatshepsut (see HATASU), was co-regent throughout his reign, and was the real ruler of the kingdom.

THOTHMES III was one of the greatest of all the Egyptian monarchs. The evidence as to his parentage is not altogether clear, but in all probability he was the son of Thothmes I by a wife named Iset, or Isis, and the half brother of the great Queen Hatshepsut (HATASU). In a short time the party of Hatshepsut was able to thrust Thothmes III into the background. Her rule was, however, soon terminated for a while by the coalition of Thothmes I and II who got control and ruled together until the death of the former gave the party of Thothmes III a chance to regain the throne. The Queen, however, was powerful enough to dominate and until her death the government seems to have been in her hands, while she seems to have allowed Thothmes III merely a nominal share in the government. As soon as her death left him sole ruler he entered upon a career of conquest unrivaled in the annals of Egyptian history. Assembling an army for the invasion of Syria, he celebrated the twenty-third anniversary of his accession at Gaza. Marching thence through the passes of Mount Carmel, he defeated the allied Syrian forces on the plain of Esdraelon and forced them to take refuge in the city of Megiddo, which capitulated after a brief siege. The captive Syrian chiefs were restored to their dignities as vassals of Egypt, and Thothmes, after receiving messages of congratulation from many foreign princes, among them the King of Assyria, returned laden with booty. The conquest was not yet complete. Some of the Syrian and Phœnician cities offered stubborn resistance and there were frequent revolts, opponents of Egypt being encouraged and supported by the powerful State of Mitanni (see AMARNA LETTERS), which at that time occupied northern Syria and northern Mesopotamia. War with this state soon followed, in the course of which Thothmes ravaged Mitannian territory and captured a number of cities, including the important city of Carchemish, on the Euphrates. He gained no permanent possessions in this quarter, but the result of the war enabled him to extend his dominions, undisturbed by Mitannian interference, over northern Palestine and Phœnicia. At the city of Ni, near the Lower Orontes, he set up a stele to mark the limit of the Egyptian Empire in that quarter. During his reign Thothmes conducted at least 14 Asiatic campaigns, and the booty and tribute he obtained were lavished upon the Egyptian temples. In the fiftieth year of his reign he caused the old canal at the first cataract of the Nile to be cleared and sailed through it on an expedition against the Nubians. As a builder Thothmes was hardly less energetic than as a warrior, and his monuments occur throughout Egypt and Nubia. He made important additions to the great Temple of Ammon at Karnak and caused his annals to be inscribed upon its walls, and he also built at Heliopolis, Memphis, Abydos, Hermonthis, Edfu, Esneh, Ombos, and other places. In Nubia, where he built or restored

*

THORVALDSEN

"CHRIST," FROM THE STATUE IN THE CHURCH OF OUR LADY AT COPENHAGEN

many temples, he was the founder of the large temple at Soleb, near the third cataract. Thothmes III died about 1485 B.C. (Breasted says 1447); his mummy was among those found at Deir el Bahri in 1891.

THOTHMES IV, the son of Amenophis II (q.v.) and the grandson of Thothmes III, ruled for nine years from about 1460 B.C. He conducted military expeditions to Nubia and to Phœnicia, collecting booty and tribute in both countries, and an inscription at Ghizeh records that he cleared away the sand from the great Sphinx (q.v.). From the Amarna tablets it appears that he maintained friendly relations with Babylon and with Mitanni, and married the daughter of Antatama, King of the latter country.

THOU, 1650, JACQUES AUGUSTE DE (1553-1617). A French historian, born in Paris. He studied jurisprudence at Orleans and Valence and in 1576 became an ecclesiastical counselor of the Parlement of Paris. He was an active member of the *Politiques* (q.v.). De Thou was made keeper of the Royal Library and vice president of the Parlement by Henry of Navarre. In 1591 he began his great work, the *Historia Sui Temporis*, which covered the period from the death of Francis I to that of Henry IV (1547-1610), and which occupied him during the remainder of his life. He took an important part in the drawing up of the Edict of Nantes. The history was completed by Rigault from materials left by De Thou and comprises in its full form 143 books. The work is marked by striking fairness and a faithful adherence to fact, remarkable in a history dealing with a period of bitter partisan spirit, civil war, and anarchy. The history was published in 11 volumes (Paris, 1609-14) and 4 volumes (Frankfort, 1625), both in Latin. A French translation appeared in 10 volumes (Paris, 1740), and one in English by Buckley in 7 volumes (London, 1773). After De Thou's death appeared his memoirs, *Thuanii Commentarii de Vita Sua* (Orleans, 1620). Consult: Collinson, *Life of Thuanus, with some Account of his Writings* (London, 1807); Chasles, *Discours sur la vie et les ouvrages de J. A. De Thou* (Paris, 1824).

THOUARS, DUPETIT-. See DUPETIT-THOUARS.

THOUGHT. In logic, thought is the intellectual act whereby all knowledge is obtained (see LOGIC; KNOWLEDGE; JUDGMENT; CONCEPT; INFERENCE). In functional psychology the term is used in a narrower sense, to denote the highest or most complex intellectual function, distinguished from sense perception as dealing with general or abstract rather than with concrete objects, and from memory as being constructive rather than purely representative.

The thought consciousness itself resembles in general pattern that of active imagination. Active attention is characteristic of both, and in both the content processes depend not merely upon associative, but also and essentially upon determining tendencies, set into activity by the presence of a particular problem. In imagina-

tion, however, the problem is the production of a single, and as yet unrealized object: a machine, a future event, a work of art. In thought, on the other hand, the problem is the relation of some object of thought, taken by the thinker as real, to other objects or to truth. This difference of problem involves first a difference of attitude; in imagination the attitude is that of newness or strangeness, while in thought it is that of validity or consistency. More importantly, it involves further a typical difference in the course of consciousness. Imagination begins with a more or less complete apprehension of the requirements to be met, proceeds by a sort of constructive realization, and ends with an idea which satisfies those requirements. Thought typically begins with the aggregate idea (see IDEA), advances by repeated dissections, and ends when the various parts or aspects of the idea have been completely related. These features of similarity and difference have been expressed in the exaggerated statement that imagination is thinking in images (typically concrete), and thought is imagining in words (typically abstract).

The fact appears to be that, although thought may originally have implied the presence of language (q.v.), and still is carried on to a large extent in words, it may now go on in other terms as well. Even in the early experimental investigations of thought, it became evident that any idea, and not merely verbal ideas, might carry the meaning of generality or of abstractness. Under suitable determination, e.g., the abstract meaning of triangle may be represented by the visual image of an equilateral triangle, or by a flicker of kinæsthesia accompanying eye movement towards a board on which triangles have recently been drawn, just as well as by the word "triangle" itself. Furthermore, observers frequently reported yet other processes which seemed not to belong definitely to any previously recognized class of mental formations. They found, e.g., doubts, assurances, beliefs, expectations, consciousness of such-and-such matters, thoughts about this or that,—conscious contents which represented as if in a nutshell wide ranges of meaning and knowledge. These contents they were unable, under the complex and poorly controlled conditions of experimentation, to reduce to familiar elements; they merely indicated and named them. To such formations the name of "conscious attitudes" (*Bewusstseinslagen*) was given. Later experiments, under conditions more favorable for analysis, have demonstrated the complex character of many conscious attitudes, and have shown that they can be reduced to sensation, image, and affection. In particular, the use of the genetic method reveals the attitudes as condensations of sensation and image, often affectively toned, and shows that they take shape partly under the laws of repeated impression (association), and partly under those of selective attention (determination).

The thought idea (abstract idea, general idea, conscious attitude) may further be replaced, in accordance with the general laws of meaning and abstraction (q.v.), by purely physiological processes. The classical example of such a case is that of knowing perfectly well what we intend to say without the least representation of the coming sentence in any sort of imagery. If we here refuse to regard the nervous set or disposition as the vehicle of logical meaning, we

must have recourse to a novel type of mental content, a thought element whose essence is to point beyond itself and whose nature (aside from this indication of function) is not describable. Many psychologists at the present time hold, in fact, to some form of the doctrine of imageless thought, and maintain that consciousness is made up of functional acts as well as of content processes. The point of view from which such a belief derives has been set forth under MIND (q.v.).

THOUSAND AND ONE DAYS. An imitation of the *Thousand Nights and One Night*, or *Arabian Nights* (q.v.), written by Pétis de la Croix, a French Orientalist and traveler, in 1710.

THOUSAND AND ONE NIGHTS. See ARABIAN NIGHTS.

THOUSAND ISLANDS, THE. A collection of small islands, numbering about 1700, situated in an expansion of the St. Lawrence River, about 40 miles long and from 4 to 7 miles wide, between Ontario, Canada, and Jefferson and St. Lawrence counties, New York (Map: Ontario, J 5). They are favorite resorts for summer tourists on account of their picturesque beauty. Many are private property and contain the summer homes of wealthy Americans and Canadians.

THOUSAND LEGS. See MYRIAPODA.

THEYRAS, PAUL DE RAPIN DE. See RAPIN DE THEYRAS, PAUL DE.

THRACE, thrās (Lat. *Thracia*, from Gk. *Θράκη*, *Thrakē*, Thrace, from *Θράξ*, *Thrax*, Thracian). The ancient name of an extensive region in the eastern part of the Balkan Peninsula, whose boundaries varied at different periods. At first the designation seems to have included part of Macedonia, where early story knows of Thracians in Pieria, with whom was connected the worship of the Muses, mythical bards, and Dionysus. Later the name was applied to the great district northeast of Macedonia, with the Danube on the north, on the east the Euxine, on the south the Bosphorus, Propontis (Sea of Marmora), Hellespont, the Aegean, and Macedonia, and on the west Illyria and Macedonia. Under the Romans it designated the region south of the Hæmus Mountains (Balkans), the region to the north being the Province of Mœsia. This part of Thrace belongs mostly to Servia. (See SERVIA, *History*.) From the Hæmus three lesser chains stretch south. The three most important rivers of Thrace were the Strymon (mod. *Struma*), which during the Greek period formed the boundary between Thrace and Macedonia; the Nestus (mod. *Kara-Su*); and the Hebrus (mod. *Maritza*, q.v.), the largest—all flowing southward into the Aegean Sea. The climate was considered by the Greeks very severe—even that of Ænos, on the shores of the Aegean, was described by Athenæus as eight months of cold and four months of winter. The country was largely uncultivated and covered with forests, but the river valleys were fertile. The chief products were grain, millet, wine, and hemp. Cattle, sheep, horses, and swine were raised in great numbers. The minerals were a

vast source of wealth, the rich gold mines of Mount Pangæus attracting the Thasians, and leading the Athenians to the foundation of Amphipolis.

While the exact relation between Thracians and Greeks is still uncertain, it is clear that the former belonged to the great Indo-European family, and were probably closely akin to the Phrygians of Asia Minor, whose language indicates some connection in the past with the Hellenic people. In historic times the Thracians appear as a wild and barbarous race, fond of war, ruled over by many petty kings. In the sixth century B.C. they were subdued by the Persians, but after the retreat of Xerxes resumed independence, of which they had probably been only nominally deprived by their conquerors. In the fifth century a King, Teres, seems to have secured a decided supremacy, and under his rule and that of his son Sitalces, with whom the Athenians contracted an alliance, it is possible to speak of a Thracian kingdom. After the death of Sitalces his territory was divided into three parts, and internecine strife was resumed. Thrace thus fell an easy prey to Philip of Macedon (after 359 B.C.), who incorporated the western portion of the country, as far as the Nestus, in Macedonia, while Macedonian garrisons held the rest of the country. After the fall of Macedon before the power of Rome (168 B.C.) Thrace was for a short time independent, but in 133 B.C. it came under the Roman rule. Mœsia was formed into a province in 29 B.C., but Thrace continued under dependent kings until 46 A.D., when it was organized as a province. After the division of the Roman Empire (395) it shared the history of the Eastern Empire. The natural resources of the country and the opportunities for profitable trade early led to the establishment of Greek colonies along the coast. The first were naturally along the waters flowing to the Black Sea, among them Byzantium, Selymbria, Perinthus, Sestus, and Eleus. Before the end of the sixth century B.C. Miltiades had secured the Thracian Chersonese (the modern Peninsula of Gallipoli) for Athens. Along the Aegean coast were Amphipolis, Abdera, Mesembria, Ænus, and many others, while on the Black Sea were Istrus, Tomi, Odessus, and Apollonia. These colonies, however, never attempted to control the interior, and, though they submitted to the Persians, and later to the Macedonians and Romans, their history belongs to Greece rather than to Thrace. In 334 A.D. a colony of Sarmatians was planted in Thrace by Constantine, and in 376 another of Goths by permission of Valens. In 395 it was overrun by Alaric and in 447 by Attila. Soon after the middle of the fourteenth century Sultan Amurath I obtained possession of all its fortresses, except Constantinople. After the fall of Constantinople in 1453 all of Thrace came under the control of the Turks. As a result of the Russo-Turkish War (1878) the northern part of Thrace was set up as a separate administrative district (Eastern Rumelia). The Conference of London in 1913, which closed the Balkan Wars (q.v.), gave this province outright to Bulgaria. Consult: Hiller von Gaertringen, *De Græcorum Fabulis ad Thraces Pertinentibus* (Göttingen, 1886); Tomaschek, *Die alten Thraker* (Vienna, 1893-95); Kalopothakes, *De Thracia, Provincia Romana* (Berlin, 1894); W. Ridgway, *The Early Age of Greece*, vol. i (Cambridge, 1902); and the

article "Thrakien" in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914). See BALKAN PENINSULA; BULGARIA.

THRA'CIAN SA'MOS. See SAMOTHRACE.

THRALE, thrál, HESTER LYNCH. An English author. See PIOZZI.

THRA'SEA PÆTUS (PUBLIUS CLODIUS THRASEA PÆTUS) (c.20-66 A.D.). A Roman of Nero's time, famous as a Stoic philosopher. He was born at Patavium (Padua). As Stoic he took as his model Cato the Younger (q.v.). He married Arria the Younger (see ARRIA, at the end), and gave his daughter in marriage to Helvidius Priscus (q.v.). His independence and boldness of speech won the hatred of Nero, and the Senate, at Nero's command, condemned him to death. Consult Pliny, *Epistles*, iii, 6, with the notes in the edition of that book by J. E. B. Mayor (London, 1880), and Tacitus, *Annales*, xvi, 21-35.

THRASH'ER (variant of *thrasher*, from thrush). A name given in the United States to the various species of thrushlike wrens of the

HEAD OF CRISSAL THRASHER.

genus *Harporhynchus* or *Toxostoma*. They have generally a rather long decurved bill, not notched near the tip; short concave wings, much shorter than the tail. In color they are brown or ash above, usually spotted on the breast. Their names are brown thrasher (*Toxostoma rufum*); Cape San Lucas thrasher (*T. cinereum*); gray curve-bill thrasher (*T. curvirostre*); California thrasher (*T. redivivum*); crissal thrasher (*T. crissale*); and Arizona or Bendire's thrasher (*T. bendirei*); besides which there are several subspecies. Only the brown thrasher is widely distributed; all the others are confined to the

BROWN THRASHER.

southwestern United States, especially Arizona and Mexico. The brown thrasher, often improperly called brown thrush, is common in the eastern United States, ranging north to Canada and west to the Rockies. It is migratory in the north, but winters in the Southern States. It is about a foot long, rich ferruginous above, creamy, spotted with brown beneath. It is one

of the finest songsters native to America and is also a very fine mimic, thus resembling the mocking bird, to which it is nearly related. Its nest is placed in a low bush or on a brush heap, and the eggs are profusely peppered with brown specks. The brown thrasher, although a vegetarian in part, still is to be considered as a beneficial bird because of the numerous grasshoppers, caterpillars, and bugs destroyed by it. While it does destroy some young grain and fruit it more than makes up for this in the destruction of cutworms and cankerworms, larvæ very injurious to crops. See Plate of EGGS OF AMERICAN SONG BIRDS. Consult Coues, *Birds of the Colorado Valley* (Washington, 1878), and E. H. Forbush, *Useful Birds and their Protection*, published by the Massachusetts State Board of Agriculture (Boston, 1913).

THRASYBU'LUS (Lat., from Gk. Θρασύβουλος, *Thrasýboulos*) (?-390 B.C.). An Athenian general and a prominent member of the democratic party at Athens during the last years of the Peloponnesian War. In company with Thrasyllus at Samos, in 411, he vigorously opposed the establishment of the Four Hundred, and helped secure the recall of Alcibiades from exile. In the same year he, with Thrasyllus, defeated the Peloponnesian admiral Mindarus at Cynossema, and in 407, in command of a fleet of 30 vessels, he compelled the submission of the revolted cities in Thrace. He held a subordinate command in the battle of Arginusæ (406 B.C.), and afterward concurred with Theramenes (q.v.) in the accusation of the generals therein engaged. Being banished (404) by the Thirty Tyrants (q.v.), he went to Thebes, where he planned the overthrow of the Thirty and the re-establishment of the democracy. With 100 men, refugees also, he seized the deserted fort of Phyle, and, joined by others, advanced on the Piræus. In the ensuing battle the Thirty were worsted, and, as a result, the democratic form of government was soon reestablished at Athens. In 395 Thrasybulus commanded a force sent to assist Thebes against the Spartans. In 391 he was dispatched, in command of 40 triremes, to the assistance of Rhodes, but, first sailing to the Hellespont, succeeded in extending the alliances of Athens in those regions. When the fleet of Thrasybulus reached Pamphylia he was slain by night in his tent by the people of Aspendus, in consequence of some of his soldiers' misdeeds.

THRASYL'LUS (Lat., from Gk. Θράσυλλος), MONUMENT OF. A choragic monument at Athens erected in 320 B.C., by Thrasyllus, in a cave above the Theatre of Dionysus. An ornamental architectural front closed the cave and was surmounted by a statue of Dionysus, now in the British Museum. The monument is in ruins, except an inscribed architrave, and two columns for votive tripods, on the rock face above the cave.

THREAD. A twisted filament of two or more strands of some such substance as cotton, silk, or wool, spun out to a considerable length, and suitable for sewing. See SPINNING.

THREADFIN. See BARBUDO; MANGO FISH.

THREADFISH, COBBLER FISH, or SUNFISH. A well-known fish (*Alectis ciliaris*) allied to the pompanos, of both coasts of tropical America, where it has some commercial importance. It is of moderate size, has the curious shape shown in the illustration, and owes its names to the long filaments (becoming shorter with

age) into which the first few rays of the dorsal and anal fins are prolonged.

THREADFISH.

THREAD HERRING, or **MACHUELO**. A small fish (*Opisthonema oglinum*), closely related to sardines and menhaden, common along the southern coast; it is 12 inches long, bluish above and silvery below, with an indistinct bluish shoulder spot, and has a long dorsal-fin filament, from which the fish receives its name.

THREAD'NEE'DLE STREET. A London street, on which stands the Bank of England, hence popularly called the Old Lady of Threadneedle Street. The origin of the name is said to be the three needles as the escutcheon of the Needle-makers' Company.

THREADWORMS. The threadworms or roundworms, so called from their slender round threadlike body, are members of the class Nematelminthes, order Nematodea. The dense skin is not segmented, and the body cavity (coelome) is not lined with epithelium, but is directly bounded by the muscles of the body. There is a definite digestive canal. Two excretory canals open in front on the ventral side of the body, while the nervous system consists of a ring around the pharynx, from which two main nerve cords pass backward. The true threadworms undergo no metamorphosis. They are mostly parasitic and usually bisexual. Some are free, living coiled up under stones between tide marks; certain minute species occur in fresh water or damp earth. A few live in plants, and *Tylencha tritici* damages wheat. The more common parasitic forms are species of *Ascaris*, *Trichina*, *Oxyuris*, etc. Of *Ascaris*, the human roundworm (*Ascaris lumbricoides*) is remarkable for its great size, being 5-6 inches long, and about $\frac{1}{16}$ of an inch in diameter; it has three papillae around the mouth and is milk white. The common pinworm (*Oxyuris vermicularis*) lives in the rectum of children; the palisade worm (*Eustrongylus gigas*), one female of which was 39 inches in length and the thickness of a quill, the male being one-third as long, has been found living in man; allied species occur in the brain or brain cavity of birds. Among the most formidable human parasites of this group are the *Trichina* (q.v.), the guinea worm (q.v.), and the species of *Filaria*. *Filaria sanguinis hominis*, a microscopic threadworm found living in the blood of the mosquito in India and China, is thought to occasion the disease known as elephantiasis. The formidable disease *beriberi* is supposed to be due to a nematode worm, whose eggs and embryos swarm by millions in soil and puddles near villages. In certain species of the family Anguillulidae there is an alternation of generations (see **PARTHENOGENE-**

SIS), from an hermaphroditic internal parasitic to a free dioecious generation. Thus *Rhabditis* (*Rhabdonema*) *nigrovenosa* lives in mud, and gives rise to a second form living in the lungs of frogs.

THREATS. See **BLACKMAIL**; **CONSPIRACY**; **FALSE IMPRISONMENT**; **INTIMIDATION**; and consult the authorities referred to under **CONSPIRACY** and **CRIMINAL LAW**.

THREE CHAPTER CONTROVERSY. See **CHAPTERS, THE THREE**.

THREE CHOIRS FESTIVAL. An English musical festival which had its first regular organization in 1724, when the three cathedral choirs of Gloucester, Worcester, and Hereford joined for the performance of a cathedral service, and an oratorio performance given in the Shire Hall. The proceeds have always been devoted to a fund for the relief of the widows and orphans of the poorer clergy of the three dioceses. In 1753 the festival was extended to three days, and in 1836 to four days, the period which still prevails. The festivals are held alternately in each of the three cities.

THREE-COLOR PROCESS. A photomechanical process of reproducing in color applicable either to stone or metal. The general process consists in first making three photograph negatives of the same subject through three different color screens representing the three primary colors, red, yellow, and blue. From these three negatives printing blocks are made and the result is obtained by making three printings, one from each block, with three different pigments, each pigment representing as nearly as possible the color originally used in the color screen. The accuracy of the finished picture depends, therefore, to a great extent, upon the correctness of the pigments selected. In much of the best modern color work a fourth plate printing in black or gray is employed to give greater depth to the shadows. Reference should also be made to **COLOR PHOTOGRAPHY**, where the underlying principles are explained. The method of making the metal half-tone plates is discussed under **PHOTO-ENGRAVING**; while three-color work with stone plates is treated under **LITHOGRAPHY**.

THREE EMPERORS' LEAGUE. See **TRIPLE ALLIANCE**.

THREE IMPOSTORS, THE. See **IMPOSTORS, THE THREE**.

THREE KINGS OF COLOGNE. The three wise men of the East or Magi who followed the star to the birthplace of the infant Jesus. Their names are usually given as Gaspar, Melchior, and Balthazar. Their bones are supposed to be preserved in Cologne cathedral.

THREE MUSKETEERS. See **TROIS MOUSQUETAIRES**.

THREE RIVERS (correctly, **TROIS RIVIERES**). A port of entry and the capital of St. Maurice County, Quebec, Canada, at the junction of the St. Lawrence and St. Maurice rivers, and on the Grand Trunk and the Canadian Pacific railroads, midway between Montreal and Quebec (Map: Quebec, H 5). It was founded in 1634 by Lavolette, who was sent by Champlain, and is 23 miles from the famous falls of Shawinigan. It has a Roman Catholic cathedral, a convent, a classical college, a commercial academy, and various manufactures. Here on June 8, 1776, an American force of about 2000 men under General Thompson attacked a British force of about 6000 men, and was disastrously defeated. Pop., 1901, 9981; 1911, 13,691.

THREE COLOR PROCESS

THREE RIVERS. A city in St. Joseph Co., Mich., 25 miles south of Kalamazoo, on the Michigan Central and the New York Central railroads (Map: Michigan, D 7). It is situated at the junction of the St. Joseph, Portage, and Rocky rivers. The leading manufactures are cars, railroad supplies, marine engines, leather, robes, knit goods, paper, tools, brass, and foundry and machine-shop products. It maintains a Carnegie library. Pop., 1900, 3550; 1910, 5072.

THRESHER SHARK, FOX SHARK, or SWINGLETAIL. A peculiar shark (*Alopias vulpes*) abounding in all warm seas, especially in the Mediterranean and the Atlantic, and distinguished by its long tail. (See Plate of GREAT SHARKS under SHARK.) This is an extension of the upper lobe of the heterocercal tail to a length equal to or exceeding that of the body, and is used in obtaining the food. This shark feeds on schools of herring, menhaden, etc., rushing into them, and threshing about with its tail. It is about 15 feet long, lead color above, whitish beneath.

THRESHING (from *thresh*, AS. *þerscan*, OHG. *drescan*, Ger. *dreschen*, to thresh) and **THRESHING MACHINES.** Threshing is the separating of the grain or seeds of plants from the straw or haulm. This has been accomplished in various ages and countries by differing means, more or less effective. The first method known was the beating out of the grain from the ears with a stick. An improvement on this was the practice of the ancients of spreading the loosened sheaves of grain on a circular piece of hard ground and driving oxen or other animals over it, so as to tread the grain out; but as this was found to damage some of the grain, it was partially superseded in later times by the threshing sledge, a heavy frame mounted on three rollers, or having pieces of iron or sharp flints fastened to the lower side, in place of rollers. The threshing sledge is still to be seen in operation in Greece, Asia Minor, Georgia, and Syria. The primitive implement in northern Europe was the stick, and an improved modification of it, the flail, which consists of two sticks loosely fastened together by stout thongs, is still sometimes used in Europe and America.

Early but unsuccessful inventions to supersede the flail by a machine, both in England and America, were largely of the rotary beater or flail type, as was that devised by Menzie in 1750.

Meikle's drum with two grooved cylinders have, however, been almost entirely superseded in modern machines by a high-speed cylinder with radial teeth playing between inwardly projecting teeth set in a fixed concave or section of a cylinder. With the exception of the endless apron machine patented by the Pitt Brothers of Winthrop, Me., in 1837, little progress was made in perfecting the threshing machine in America prior to 1840. Since that date improvement has been rapid, and the modern American machine with a capacity of 1000 bushels per day is a marvel of ingenuity and efficiency. The first machine merely threshed the grain. In its most advanced form the modern machine cuts the bands of the sheaves and feeds itself; thoroughly separates the grain from the straw; winnows and weighs the grain and deposits it in sacks or loads it into wagons; removes the straw and stacks it. The figure shows the principal features of the interior construction of a simpler form of modern threshers. The concave is open and has in rear an open grate so that the larger part of the grain is separated from the straw at this point and is conveyed directly to the fan. A considerable portion, however, still remains in the straw and can be separated only by further agitation, which is secured by the vibrating separator, revolving pickers or beaters, and shaking forks shown in the centre of the machine to the rear of the cylinder. These devices beat the straw thoroughly while conveying it to the rear of the machine, where it is taken by the stacker, which consists either of an elevator or tube with blast. The separated grain drops through the perforated bottom of the separator and with the grain coming directly from the drum is carried to the fanning mill by means of a vibrating platform or conveyor located immediately beneath the separator. The parts of the modern threshers are in large measure adjustable, so that it may be adapted to different kinds of grain and to a variety of conditions, but separate machines for special purposes are also made, as, e.g., for threshing rice, peas and beans, peanuts, clover, and for husking maize and shredding the fodder. Pea and bean threshers usually have two cylinders running at different rates of speed. Clover hullers have an additional hulling cylinder. Inventive genius is also being exercised

in devising ingenious accessories to the threshers proper—automatic band cutters and feeders, stackers, and grain measurers and loaders.

The motive force is horse power or steam. The former (treads and sweeps) was most common in the earlier days, but has been largely superseded by the portable steam engine and the internal combustion engine. Engines with straw-burning furnaces have been used in Hungary and in the rice regions of the United States.

Thresher fires are of frequent occurrence, often due, as the Washington Agricultural Ex-

LONGITUDINAL SECTION OF MODERN THRESHER.

In 1786, however, Andrew Meikle, an ingenious Scotch mechanic, produced a threshing machine so perfect that, despite nearly a century of improvers, it is essentially the machine of its inventor and embodies many of the essential features of the improved modern machine.

pert Station has shown (*Bulletin 117*), to ignition and explosion of dust by static electricity generated by the cylinder. The danger is especially great in very dry seasons and with a large amount of smut and organic dust from broken grain and straw. One of the preventives suggested is to ground the cylinder. Consult: G. F. Conner, *Science of Threshing* (St. Joseph, Mich., 1906); Davidson and Chase, *Farm Machinery and Farm Motors* (New York, 1908); G. F. Conner, "Using the Modern Grain Separator," in *Power Farming* (Chicago, January, 1916).

THRIFT (Icel. *þrift*, from *þrifa*, to thrive, clutch, grip; so called from the rapid growth of the plant), *Armeria*. A genus of plants of the family Plumbaginaceæ, having the flowers collected into a rounded head. By many botanists it has been regarded as a subdivision of the genus *Statice*, from which it is distinguished chiefly by having the flowers in heads. The common thrift (*Armeria maritima*) is a European seacoast plant which grows in turflike form, with linear leaves, scapes a few inches high, and beautiful rose-colored flowers in mid-summer. Being hardy and easily cultivated, it is often planted in gardens as a border, but it must be renewed every two or three years; the smallest roots grow, however, with great readiness in the moist weather of spring. A number of other species, i.e., *Armeria elongata*, *Armeria plantaginea*, are planted as ornamentals.

THRIPS (Lat., from Gk. *thrips*, woodworm). Any one of the minute insects of the order Thysanoptera. They are slender insects with four wings, which are also very slender and short, perfectly transparent, and without veins. The wings are fringed with long, delicate hairs, and when at rest lie along the back of the abdomen. The metamorphosis is incomplete, and the mouth parts function in sucking, but are intermediate between true biting and true sucking mouth parts. The feet bear each a little bladder-like vesicle at the tip, from which an old name of the order (Physapoda) was derived. Thrips are found in flowers, and do some damage to the essential organs. They also occur upon the leaves of plants, and one species damages onions (see ONION INSECTS) and tobacco. Another species (*Limothrips poaphagus*) works in the joints of timothy grass, causing the heads prematurely to turn yellow and die. Some species have been observed feeding upon other insects and others undoubtedly have some beneficial effect as pollinators of flowers. Parthenogenesis sometimes occurs with these insects. Rather more than 30 species occur in the United States. The name "thrips" has been erroneously applied by vine growers to some of the leaf hoppers of the family Jassidæ. Consult Hinds, *Contribution to a Monograph of the Insects of the Order Thysanoptera Inhabiting North America* (Washington, 1902). See LEAF HOPPER.

THROAT (AS. *þrotu*, OHG. *throzza*, Ger. *Drossel*, throat; connected with MHG. *strozze*, throat, Ger. *strotzen*, to swell, Eng. *strut*), AFFECTIONS OF THE. The throat includes those structures lying behind and below the anterior pillars of the fauces. In common acceptation, it also means the anterior portion of the neck, containing the windpipe, gullet, and a number of large blood vessels and nerves. The throat may be divided anatomically into the pharynx and the larynx, the latter being the upper part of the windpipe and the principal organ of the

voice. The nasal passages and the Eustachian tubes open into the pharynx, and its entrance is nearly surrounded by a ring of lymphoid tissue, comprising the faucial, lingual, and pharyngeal tonsils. The first of these (usually called the tonsils) are always present, and often enlarged, and are situated at the sides of the fauces between the anterior and posterior pillars. The lingual tonsil, when it exists, lies at the base of the tongue, in front of the epiglottis. The pharyngeal tonsils, more often called adenoid growths, spring from the roof and sides of the pharyngeal vault. They are often present in children and when in any amount constitute a pathological condition, giving rise to obstructed nasal breathing, nasal catarrh, and general poor health. Any or all of these structures may be involved in diseases of the throat, and expert examination of them is often necessary. Inspection is usually conducted by light reflected into the throat from a head mirror, a circular, concave reflector pierced with a hole for vision. The light is projected through the open mouth upon the back of the throat. From this point the rays of light may be reflected by means of a small mirror introduced into the pharynx either downward to examine the larynx (laryngoscopy) or upward to inspect the posterior nares and the vault of the pharynx (rhinoscopy), the tongue being meanwhile held out or depressed. In direct examination the tonsils, soft palate, uvula, posterior wall of the pharynx, and often the top of the epiglottis may be seen. Laryngoscopy shows the whole of the epiglottis, the root of the tongue, lingual tonsil, the true and false vocal cords, the opening of the glottis, and even the bifurcation of the trachea. The throat is lined with mucous membrane, plentifully supplied with blood vessels, glands, and nerves, and is often the seat of acute or chronic catarrhal inflammation. Acute or chronic inflammation of either the pharynx or larynx may be due to exposure, sudden change of temperature, the inhalation of dust, steam, or irritating vapors, indigestion and constipation, and certain diseases such as rheumatism, gout, and tuberculosis. Specific inflammations of the throat accompanying scarlatina and diphtheria are described under these titles. Catarrhal inflammation of the throat is marked by a sense of dryness, or of a foreign body in the pharynx, a slight but annoying cough, and the expectoration of viscid, tenacious mucus, sometimes tinged with blood. The voice is hoarse, easily fatigued, or entirely absent. In the treatment of catarrhal conditions in this region, alkaline and antiseptic douches are given to remove the mucous accumulations, and stimulating and astringent applications, such as tannin, iron, and nitrate of silver, used to reduce congestion and restore the membrane to its normal action. Nasopharyngeal catarrh is frequently caused by intranasal abnormalities and may as often be remedied by restoring natural respiration through the nose. Chronic inflammation of the accessory sinuses of the nose is often a sequel of the acute infectious diseases such as grippe, and tends to keep up a chronic nasal discharge. General tonic treatment is always necessary. Internally iron, quinine, and strychnine are the best remedies.

Abscesses sometimes occur in the throat either in the region of the tonsils (see QUINSY) or at the base of the tongue. An acute and alarming

inflammation of the loose tissues about the larynx is found in connection with abscess, acute laryngitis, the injecting of scalding fluids or irritant poisons, and as a complication of certain diseases such as smallpox, scarlatina, or Bright's disease. In this condition, known as œdema of the glottis, the swollen and dropsical tissues fill up or overlap the opening of the glottis, preventing the ingress of air and threatening immediate suffocation. If not speedily relieved, œdema of the glottis causes death by asphyxiation. This affection is treated by puncture or scarification of the dropsical sac, the application of leeches over the sides of the larynx, and the administration of pilocarpine. Sometimes intubation, laryngotomy, or tracheotomy may be necessary. Intubation consists in the introduction of a metal or hard-rubber tube between the vocal cords, with a flange resting above them to prevent slipping into the trachea. Laryngotomy or tracheotomy is employed when intubation is not feasible. The former consists in opening the larynx from the outside through the cricothyroid membrane, and introducing a tube through which the patient breathes. In tracheotomy the opening is made lower down, in the trachea.

Tuberculous laryngitis occurs in many phthisical patients. There is swelling, ulceration, and destruction of the vocal cords and adjacent structures, with hoarseness, loss of voice, great pain, and inability to swallow solid food. Syphilis, particularly in its tertiary stage, often attacks the throat, producing fibrous tissue which gradually contracts, and narrows, distorts, and partially destroys the larynx. Foreign bodies sometimes find their way into the larynx, and if small may pass into the trachea or bronchial tubes, and failing removal may produce death by suffocation or set up a fatal pneumonia. In children it is often possible by inverting and shaking the patient to dislodge a foreign body; in other cases these have to be removed by specially devised instruments or a cutting operation. A long, electrically lighted metal tube called a bronchoscope is now generally employed for the purpose. Cancer and other tumors of a polypoid or fibrous character may develop in the larynx or its neighborhood. Cancer is nearly always fatal. Consult: J. W. Downie, *Clinical Manual for Study of Diseases of the Throat* (2d ed., New York, 1906); W. L. Ballenger, *Diseases of the Nose, Throat, and Ear: Medical and Surgical* (4th ed., Philadelphia, 1914); D. B. Kyle, *Textbook of Diseases of the Nose and Throat* (5th ed., ib., 1914); H. W. Loeb and others, *Operative Surgery of the Nose, Throat, and Ear* (2 vols., St. Louis, 1914-15); B. C. Giles, *Nose, Throat, and Ear: Their Functions and Diseases* (Philadelphia, 1915). See ADENOID, ADENOIDS; CATARRH; DIPHTHERIA; LARYNGITIS; QUINSY; TONSIL.

THROMBOSIS (Neo-Lat., from Gk. *θρόμβωσις*, the state of being curdled, from *θρόμβος*, *thrombos*, curd, clot). A term originally suggested by Virchow, and employed to designate an affection of the blood vessels (either veins or arteries) which essentially consists in a coagulation of blood (forming a true clot) at a certain fixed spot, owing to disease of the blood vessel, pressure against its side or laceration of it, or microbial infection. It is a common cause of sudden death in persons who appear to be in robust health. If death does not result, after the detachment of a thrombus and its lodgment,

as an embolism, in a cerebral artery, softening of the brain follows. See APOPLEXY; EMBOLISM.

THROMBUS. A stratified clot formed within a blood vessel by coagulation at a bifurcation of a vessel or upon a surface roughened, e.g., by inflammatory or sclerotic changes. See THROMBOSIS.

TRONDHJEM. See TRONDHJEM.

THROOP. A borough in Lackawanna Co., Pa., adjoining Scranton, on the New York, Ontario, and Western and the Delaware, Lackawanna, and Western railroads. There are productive coal mines and a silk mill. Pop., 1900, 2204; 1910, 5133.

THROOP, MONTGOMERY HUNT (1827-92). An American lawyer, nephew of Enos T. Throop, Governor of New York. He was born at Auburn, N. Y., was educated at Hobart College and abroad, was admitted to the New York bar in 1848, and practiced in partnership with Roscoe Conkling. In 1870 he was appointed a commissioner to revise the statutes of the State; afterward was chairman of the commission that prepared the Code of Civil Procedure, and after 1878 devoted himself to legal writing. His publications include a *Treatise on the Validity of Verbal Agreements* (1870); an *Annotated Code of Civil Procedure* (1880); and the *Revised Statutes of New York* (1888).

THROSTLE. See SPINNING.

THROW (AS. *þrāwan*, OHG. *drāhan*, *drājan*, Ger. *drehen*, to turn, twist). The term applied in mining to the amount of dislocation (q.v.), in a vertical direction, produced by a fault in the strata. That side of the fracture which has moved downward relatively is spoken of as the downthrow side, the opposite one as the upthrow. See FAULT.

THRUSH (AS. *þrysce*, OHG. *drōscela*, Bav. *Droschel*, thrush; connected with AS. *þrostle*, *proslē*, Eng. *throstle*, Ger. *Drossel*, thrush). The thrushes comprise the subfamily Turdinæ of the family Turdidae, usually ranked as the highest group of birds. They have a bill of moderate size, straight, shorter than the head, and provided at the base with rictal bristles; the nostrils are oval and bare; the tarsi are long, slender, and booted; ten primaries are present, but the outermost is exceedingly small; tail shorter than wings. About 150 species, all of moderate size, are known, and they are widely distributed, and most of them are migratory. A few species are gregarious, but the majority live singly or in pairs. Their food is mainly adult insects and caterpillars, of which they destroy incalculable numbers, but in winter they eat berries and seeds, and in spring small fruits. Thrushes are to be considered as birds of economic value both because of their destruction of many insect pests, such as the forest tent caterpillar and the gypsy moth, and also because certain of the thrushes aid in reforesting burnt areas through eating stone fruits, as cherries. All are excellent singers, and some are counted the best of bird songsters.

In America, north of Mexico, there are about a dozen species of thrush, of which the best known is the common robin (q.v.), which ranges over the whole continent. In Lower California there is an allied species; and in the Northwest occurs the varied thrush. (See OREGON ROBIN.) The more distinctive thrushes are considerably smaller than the robin, and all of them are birds of the woods. They belong to the genus *Hylocichla*, formerly included in *Turdus*.

The best known are the Wilson's thrush or veery (*H. fuscescens*), the song or wood thrush (*H. mustelina*), the olive-backed thrush (*H. ustulata*), and the hermit thrush (*H. guttata*), the two latter being divided into a number of subspecies. All these are seven or eight inches long, olive or brown above, white, more or less creamy, and spotted below. The wood thrush or wood robin is a less retiring bird, not infrequently seen on lawns and in orchards. He is larger than the veery, with the head bright cinnamon brown, changing gradually into light olive brown towards the tail. Moreover, he is thickly marked with large round black spots underneath. The song of this thrush, especially as evening approaches, is remarkably sweet and has made him a great favorite with bird lovers. The ordinary calling note has been likened to striking pebbles together; it is utterly unlike the clear whistle of the veery. The nest is usually in a bush or on a tree limb or a stump, five or ten feet from the ground, and is distinctively characterized by always having a foundation of dead leaves, often with some mud. The eggs are clear blue. The olive-backed thrush is a more northerly species than either of the preceding, and occurs in the United States chiefly as a migrant, while it winters in the tropics. It is readily distinguished by the uniform olive upper parts, and the bright buff lores and rings around the eyes. The only species with which it is at all likely to be confused is the gray-cheeked thrush (*H. alicia*), a bird of similar range and habits, without the buff lores and eye rings, and formerly regarded only as a variety. The eggs of both are blue, spotted and speckled with bright brown. The hermit thrush may be easily recognized by the fact that the tail is rufous, brighter than the back. It is also a somewhat smaller and more slender bird than either the veery or wood thrush. It is distributed over the whole of North America, but breeds mainly north of the United States. There are several subspecies recognized by names, as in the preceding species. Owing to priority of description the olive-backed thrush of the East is the subspecies *swainsoni* and the hermit thrush of the same region is the subspecies *pallasi*. The latter is one of the most renowned songsters of America, although, on account of its northern breeding grounds and retiring habits, few persons hear it. While some regard the notes as not essentially superior to those of the wood thrush, most writers on bird music agree that, for purity and sweetness of tone and exquisite modulation, the hermit is unequalled. The nest and eggs are very similar to those of the veery.

The thrushes of the Old World are numerous and well-known birds, of which several are common in Great Britain, as the song thrush or mavis, the mistle thrush, blackbird, ouzel, fieldfare, and redwing (qq.v.).

The name "thrush" is sometimes given to birds of other families, which are exceptional songsters. Thus in the United States the thrasher (q.v.), one of the finest singers of all, is often called brown thrush, although more nearly a wren. On the other hand, various members of the family are known by other names, as the bluebird, robin redbreast, stonechat, and various small Oriental genera.

The Turdinæ, characterized by the fact that the young are constantly spotted, although they may become concolorous when adult, is only one

of the five subfamilies into which, according to some authors, the great thrush family (Turdidæ) is divided. The other subfamilies are the Myio-dectinæ, a small group of brownish flycatcher-like birds; the Sylviinæ, or Old World warblers (see WARBLER); the Polioptilinæ, or gnat catchers and wren tits (qq.v.); and the Mimina, or American mocking birds, including the incomparable mocking bird of the Southern States. It should be added that some ornithologists object to this widely inclusive use of the family name and confine it to the thrushes proper. Consult authorities cited under BIRD. Consult Forbush, *Useful Birds and their Protection*, Massachusetts Board of Agriculture (Boston, 1913).

THRUSH (dialectic Swed. *trösk*, Swed. *toršk*, tongue thrush). An inflammation and ulceration of the sensitive surfaces within the frog of horses' feet, giving rise to a fetid discharge, constituting unsoundness, and usually causing lameness. Want of cleanliness is the chief cause. The disease is most common in draft horses. The term "thrush" is often applied to foot-and-mouth disease (q.v.). Consult Leonard Pearson and others, *Special Report on Diseases of the Horse*, published by the United States Bureau of Animal Industry (rev. ed., Washington, 1911).

THRUSH; SPURTE; INFANTILE SORE MOUTH. A disease of early infancy, characterized by the presence of small, roundish white specks or patches on the lining membrane of the cavity of the mouth and throat, on the surface of the tongue, the angles of the lips, etc. These patches, which are termed *aphthæ*, look like minute drops of tallow or fragments of curd, and are formed by elevated portions of epithelium covering a drop of serous fluid; and as the dead epithelium falls off, a red, usually raw, surface is exposed. The cause is a fungus, the *Oidium* (or *Saccharomyces*) *albicans*, which combines with cast-off epithelial cells and with food (milk) to form the spongy, fragile membrane. In thrush crops of these little patches commonly succeed one another. These spots render the mouth hot and tender, and sucking is therefore accompanied by difficulty and pain. The general symptoms are fever, flatulence, colic, and diarrhœa. The stools are green, slimy, and acid. The disorder usually lasts 8 or 10 days, and is attended with danger only when the local affection becomes gangrenous. Thrush is contagious and is transmitted chiefly by dirty nipples and feeding bottles. The disease rarely appears in healthy individuals, but in those whose vitality has been impaired by the exanthemata, pneumonia, or even slight intestinal disturbances, it may be contracted. Acidity of the saliva, often produced by fermentation of milk curds, or normal in infants, may further the growth of the thrush fungus. The preventive treatment is absolute cleanliness of nursing bottle and nipples and pasteurizing the milk; too vigorous cleansing of the child's mouth is bad. When the disease is established, gentle cleansing of the oral cavity with a solution of borax, boracic acid, or bicarbonate of soda, or potassium permanganate, together with such constitutional treatment as may be needed, is indicated.

THUCYDIDES, thū-sīd'ī-dēz (Lat., from Gk. Θουκυδίδης, *Thoukydídēs*) (?-c.399 B.C.). A famous Greek historian, son of Olorus and Hegesipyle, born in the Attic deme Halimus. The date of his birth is unknown, but was certainly not earlier than 470 B.C. nor later than

REPRESENTATIVE SONG BIRDS

- 7 RED-SPOTTED BLUETHROAT - CYANOSYLVA SUEGICA

454. Conservative opinion now favors a date near the latter year. By descent he belonged to an ancient aristocratic family on one side, and on the other was connected with a line of Thracian princes. From this Thracian side of his family he possessed gold mines in Thrace (q.v.) opposite the island of Thasos (q.v.). He was well educated; tradition says that he was the pupil of Antiphon and Anaxagoras. In politics he favored the aristocratic party, but his views are all marked by moderation and fairness. When the Peloponnesian War broke out, Thucydides was of an age to enable him to discern the importance of the contest and to form plans for recording its course and result. In 424 he was appointed to command a portion of the fleet off the Thracian coast, and in the same year he failed to arrive in time to relieve Amphipolis (q.v.), which was besieged by Brasidas (q.v.). For this failure he was condemned to death for treason, but left Athens and lived the next 20 years in exile. This period he spent partly on his estates in Thrace and partly without doubt in examination of the scenes of the war in Italy and Sicily. He also resided for a time at the court of King Archelaus (q.v.) in Macedonia. After the restoration of the democracy at Athens in 403, Thucydides was recalled from exile. His history, which covers 21 years of the Peloponnesian War, breaks off in the middle of the year 411. The last book did not receive its final form, but there is no reason to doubt that it comes from his hand. The present division into eight books was made by later grammarians.

Thucydides is now regarded by all as the first critical historian and the greatest historian of antiquity. He brought to his undertaking a practical acquaintance with politics and military science, his natural endowments fitted him to pass impartial judgment on the events that he narrates, and he emphasizes more than once the care with which he endeavored to find out the truth. His materials were obtained in the main by personal observation or by questioning those who had been upon the ground; but for the earlier period he depended upon his predecessors. His purpose being to narrate the war, he clung closely to his subject and made few digressions, so that we have to regret that he has nothing to say of literature, art, or the conditions of the people. But the military movements of the time are portrayed with a vividness which has never been equaled. In form, his history is strictly annalistic, the account being given by summers and by winters, so that his work suffers from his failure to group events effectively. His style is the older Attic. His periods are not polished or rounded out, and his effort after brevity often makes his meaning obscure and hard to reach. Yet his style was greatly admired in antiquity, and became the model of many historians in the following centuries (e.g., among the Romans, Sallust and Tacitus). In his characterization of the leaders in the struggle between Athens and Sparta he was most successful, and frequently employs with great skill speeches which he puts into their mouths.

Bibliography. Of critical editions the most important are by Bekker (3 vols., Berlin, 1821); Haase (Paris, 1846); Hude (2 vols., Leipzig, 1898-1901). There are annotated editions by Thomas Arnold (3d ed., 3 vols., Oxford, 1847-54); Bloomfield (2 vols., London, 1842-43); Krüger (3d ed., 2 vols., Berlin, 1861); and,

most useful of all, Classen (8 vols., Berlin, 1862-78; frequently reëdited). Editions of single books are very numerous. Consult also the *Lexicon Thucydeum* by Bétant (Geneva, 1843); *Index Thucydeus* by Von Essen (Berlin, 1887). The best English translations of the history are by Bloomfield (3 vols., London, 1829); H. Dale, in the Bohn Classical Library; and Benjamin Jowett, with introduction and historical notes (2 vols., London, 1881; Boston, 1883). On the speeches see Wilkins's translation (3d ed., London, 1881) and Jebb's essay in Abbott's *Hellenica* (ib., 1880). Consult also, besides the standard histories of Greece, Christ-Schmid, *Geschichte der griechischen Literatur*, vol. i (5th ed., Munich, 1908); A. and M. Croiset, *An Abridged History of Greek Literature* (Eng. trans. by G. F. Heflebower, New York, 1904); W. C. Wright, *A Short History of Greek Literature* (ib., 1907); F. M. Cornford, *Thucydides Mythohistoricus* (ib., 1907); J. B. Bury, *The Ancient Greek Historians* (ib., 1909); G. B. Grundy, *Thucydides and the History of his Age* (London, 1911); and the article "Thukydides," in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

THUG (Hind. *thag*, a cheat, from Skt. *sthaga*, rascal). The name in northern India of a religious fraternity which committed murders in honor of Kali (q.v.), the wife of Siva (q.v.), and lived chiefly upon the plunder obtained from its victims. In the south of India they used to live under the protection of the native chieftains in consideration of a settled contribution. The Thugs were first generally known about 1800, although they existed as early as 1290. Although at the beginning of the nineteenth century they had become little more than murderers, the original religious character of their deeds survived in many ways, particularly in the bloodless character of their assassination, which points back to an unbloody sacrifice in honor of the female aspect of the destructive power of nature. They really formed a caste, as the profession was in the main hereditary, although a few recruits were admitted from without, and a number of Mohammedans joined the order. When they learned through watchers or spies that persons of property were about to undertake a journey, they either managed to accompany them or to follow them, often for hundreds of miles before a safe opportunity presented itself for accomplishing their purpose. Usually they threw around the neck of the victim a cloth called the *rumal*, or yard of cotton, with a knot in the left end, which one of the gang held at one end, while the other was seized by an accomplice. While these two Thugs drew the noose tight and pressed the head of their victim forward, a third seized him by the leg and thus threw him to the ground. If properly strangled, the sacrifice was dead before he touched the ground. The utmost care was taken to commit the murder in an unfrequented spot, and the body was buried in a place where it was not likely to be found.

Another class of Thugs murdered those in charge of children, whom the assassins then sold into slavery. Castes or classes exempt from the Thugs were washermen, sweepers, musicians, poets, blacksmiths, carpenters, oil venders, cripples, lepers, bearers of the holy Ganges water, and those who had with them a cow. Neither would a true Thug kill a woman. A portion of the plunder was usually set aside

for their tutelary deity, and a part was often allotted for the widows and families of deceased Thugs.

Kali was believed to have formerly assisted the Thugs in disposing of the bodies of their victims by devouring them. But through an indiscretion of one of the fraternity, who looked back, she became displeased, and condemned them to bury their victims. But though she refused her assistance, she presented her worshipers with one of her teeth for a pickaxe, a rib for a knife, and the hem of her lower garment for a noose. On the faith of this legend the pickaxe was the instrument especially esteemed by the Thugs and its fabrication was the subject of ceremonials. After every murder the Thugs performed a special solemnity called *tapuni*, which was celebrated in honor of Kali. Another feast observed by the Thugs throughout India was called *Kurhae Karna* or *Kote*, likewise in honor of Kali. The superstitions of the Thugs were of Hindu origin; but they were adopted also by Mohammedan Thugs, who sometimes identified Kali and Fatima.

It was only after 1831 that energetic measures against the Thugs were adopted by the British authorities, and in 1835 almost 400 were hanged and 986 were transported or imprisoned for life. By 1840 they were practically suppressed.

Bibliography. Sir W. H. Sleeman, *Ramaseena* (Calcutta, 1836); Edward Thornton, *Illustrations of the History and Practices of the Thugs* (London, 1837); James Hutton, *Account of the Thugs and Dacoits* (ib., 1857); Meadows Taylor, *Confessions of a Thug* (3 vols., ib., 1839; new ed., ib., 1873-79); Caleb Wright, *India and its Inhabitants* (Cincinnati, 1885); E. W. Hopkins, *Religions of India* (Boston, 1895).

THUGUT, *ṭoṣ'goot*, FRANZ MARIA, BARON (1736-1818). An Austrian statesman, born at Linz. He was admitted to the Oriental Academy in Vienna in 1752, went to Constantinople in 1754, and became court interpreter at Vienna in 1766. He was appointed diplomatic representative at Constantinople in 1769 and obtained the cession of Bukovina to Austria in 1771. In 1780 he was made Austrian Ambassador at Warsaw and in 1787 at Naples. He negotiated the Peace of Sistova with Turkey in 1790; was made Director General of Foreign Affairs in 1793, in which capacity he continued the anti-Prussian policy of Kaunitz, but sought also to advance Austrian interests at the expense of France. This plunged the country into the disastrous war with revolutionary France, which ended with the Peace of Campo-Formio (q.v.) in 1797. After acting for some time as administrator in the newly acquired Italian provinces, he took up his old post in the ministry. He retired in 1800 and devoted the rest of his life at Pressburg and Vienna to the study of Oriental literature.

THUILLE, *ṭoṣ'eṭe*, LUDWIG (1861-1907). A German composer, born at Bozen (Tirol). After receiving his first instruction from his father, an enthusiastic amateur, he was placed in 1877 under Pembaur at Innsbruck. In 1879-81 he attended the Musikschule at Munich, where he studied piano with Bärmann and organ and composition with Rheinberger. In 1883 he was appointed instructor of piano and theory, and in 1890 became professor. He died in Munich. His works comprise a sextet for piano and

strings; a piano quintet; a sonata for cello and piano; several choruses for female voices; and the operas *Theuerdank* (1897), *Lobetanz* (1898; in New York, 1911), *Gugeline* (1901). Together with R. Louis he wrote an excellent *Harmonielehre* (1907).

THU'JA. A genus of Conifers including about four species which occur in North America and eastern Asia. The common representative is *Thuja occidentalis* (white cedar or arbor vitæ).

THULE, *thū'lē* (Lat., from Gk. *Θούλη*, *Thoulē*). The name generally given by the ancients to the most northerly part of Europe known to them. According to Pliny the Elder it was an island in the northern ocean, discovered by the navigator Pytheas (q.v.), who reached it after six days' sail from the Orcades. Many modern geographers identify Thule with Iceland. Some, however, prefer to seek for it in that part of Norway called *Thile* or *Thilemark*, or in Jutland, the extremity of which is known as *Thy* or *Thyland*. Perhaps Mainland, the principal member of the Shetland group, has the best claim to being regarded as the Thule of Pytheas. The Romans used the phrase *Ultima Thule* to denote the most distant unknown land.

THULIUM. A rare chemical element that occurs in the minerals euxenite, samarskite, ytterspar, and others. Its existence was first suspected by Cleve in 1879, but it was first isolated in a probably pure state by Urbain in 1900. The element (symbol Tm; atomic weight 168.5) forms an oxide of the formula Tm_2O_3 and a series of well-defined salts.

THUMANN, *ṭoṣ'mān*, PAUL (1834-1908). A German illustrator and painter, born in Tschacksdorf, Brandenburg. He studied in Berlin, Dresden, and Weimar, and taught successively in the academies of Weimar, Dresden, and Berlin. He illustrated Chamisso's *Frauenliebe und -Leben* and *Lebenslieder und -Bilder*, Goethe's *Dichtung und Wahrheit*, Heine's *Buch der Lieder*, Tennyson's *Enoch Arden*, etc. His paintings include five scenes from the life of Luther (1872-73), in the Wartburg, near Eisenach. His work is characteristically German and his early style possessed much freshness and charm; later it became sentimentalized.

THUMB. See HAND.

THUMB, *tump*, ALBERT (1865-1914). A German Greek scholar, born at Freiburg. He was educated at Freiberg, Heidelberg, Leipzig, and Berlin. In 1890-92 and again in 1894 and 1912 he journeyed and studied in Greece. From 1895 to 1901 he was professor at Freiburg, from 1901 to 1909 at Marburg, from 1909 to his death at Strassburg. He was an authority on modern Greek. His publications include: *Die neugriechische Sprache* (1892); *Handbuch der neugriechischen Sprache* (1895; 2d ed., 1910; for an elaborate summary of this book in English by C. D. Buck, consult *Classical Philology*, vol. ix, pp. 84-96, Chicago, 1914); *Handbuch der Sanskrit* (2 vols., 1905); a revision (the fourth edition) of K. Brugmann's *Griechische Grammatik* (1913).

THUMB, TOM. See STRATTON, CHARLES SHERWOOD.

THUMB BIBLE. See BIBLE, CURIOUS EDITIONS OF.

THÜMMEL, *tu'mel*, MORITZ AUGUST VON (1738-1817). A German statesman and author, born at Schötenfeld. In 1768 he became Minister to Duke Ernest Frederick of Saxe-Coburg, from

whose service he retired in 1783. He wrote a humorous prose epic, *Wilhelmine* (1764); a story in verse, *Inokulation der Liebe* (1771); and a partly autobiographical and once very popular novel, in 10 volumes, *Reise in die mit-täglichen Provinzen von Frankreich* (1791-1805). *Der heilige Kilian* was posthumously published in 1818. His works (in 6 vols., 1812) were edited by himself with a biography (1820) by Gruner, and reëdited (8 vols., 1854-55).

THUMMIM. See URIM AND THUMMIM.

THUN, tōon. A town of Switzerland, on the Aar, near where it issues from the Lake of Thun, 19 miles southeast of Bern, 1845 feet above sea level, and one mile from the Lake of Thun (Map: Switzerland, B 2). The old castle of the twelfth century with its corner towers and the Gothic church are the chief buildings. There is a military institution for army officers, as the town is the chief artillery arsenal of Switzerland. The chief manufactures are pottery and bricks. Many tourists visit the town on their way to the Bernese Oberland. Pop., 1900, 6100; 1910, 7415.

THUN, LAKE OF. A lake in the Canton of Bern, Switzerland, between the town of Inter-laken on the east and that of Thun on the north-west (Map: Switzerland, B 2). It is 10½ miles long and 2½ miles wide. The scenery, though scarcely grand, is very attractive. The railway from Thun to Interlaken skirts the south shore.

THUNBERG, tōon'bērk, CARL PETER (1743-1828). A Swedish botanist. He studied with Linnæus at Upsala; sailed with a Dutch ship as surgeon (1771-75), cruising at the Cape of Good Hope; lived six years in Java and Japan, returning in 1779 to Sweden, where he was appointed successor to Linnæus in 1781 as professor of botany at the University of Upsala. To the university he donated his large and valuable collections of plants. He was honorary member of 60 learned societies at home and abroad. A genus of about 50 species of the family Acanthaceæ and numerous Oriental species of other genera are named in his honor. Among his writings are: *Flora Japonica* (1784); *Resa uti Europa, Africa, Asia* (4 vols., 1788-93; Ger., Fr., and Eng. trans.,—*Travels in Europe, Africa, and Asia*, 1796); *Prodromus plantarum Capensium* (2 vols., 1794-1805); *Flora Capensis* (1807-13; new ed., 1823).

THUNDER. See LIGHTNING.

THUNDERCLOUD (c.1856-1916). An American Blackfoot Indian chief, born in Canada. He served as a scout for the United States army in 1872-76, and participated in the capture of Red Cloud (q.v.). He was one of the Indian guides of King Edward VII (then Prince of Wales), when he hunted in the Northwest. Later Chief Thundercloud became famous as an artist's model, posing for Frederic Remington, Edwin A. Abbey, John S. Sargent, Karl Bitter, and Howard Pyle (qq.v.). He is found in many of the historical paintings in the capitol at St. Paul, Minn., which are the work of F. D. Millet, Kenyon Cox, Douglas Volk, and Edwin H. Blashfield (qq.v.). Victor Brenner used his head for the gold coins minted by the government. He died in a lodging house at Rochester, N. Y.

THUNDERING LEGION. See LEGION, THE THUNDERING.

THUNDERSTORM. See BRONTOMETER.

THÜNEN, tu'nen, JOHANN HEINRICH VON (1783-1850). A German economist, born in

Oldenburg. After receiving a thorough education in the theory and practice of agriculture and passing two semesters at Göttingen, he bought in 1810 an estate called Tellow, in Mecklenburg-Schwerin, which under his skillful management became famous as a model farm. His fame rests on his work *Der isolirte Staat in Beziehung auf Landwirtschaft und National-ökonomie*, the first volume of which appeared in 1826, the second in 1850 and 1863, and the third in 1863. In this work Thünen simplified the complex conditions of economic life by imagining an isolated state, circular in form, with land of equal fertility, laborers of equal productivity, and with the sole city and market at the centre. Having so simplified his premises, he proceeded to investigate, principally, the effect of distance from the market upon the agricultural economy of the several zones of the territory surrounding the market. In the second volume Thünen struck a new note in the political economy of his time by protesting against the common treatment of wages as the price of an inanimate commodity, and insisting upon the introduction of ethical factors. His treatment here, as generally, was highly abstract, and with the aid of the differential calculus he arrived at the conclusion that natural wages = \sqrt{ap} , where a is the amount required to support the laborer and his family and p is the product of the labor of one man, this product being defined as that part of the gross product remaining after deduction of profits, insurance, and cost of management. This law of wages expresses in a highly interesting way the modern theory that wages vary as the productivity of the laborer. At Thünen's request it was engraved on his tombstone. Consult: H. Schumacher, *J. H. von Thünen, ein Forscherleben* (2d ed., Rostock, 1883); H. L. Moore, in the *Quarterly Journal of Economics*, vol. ix (Boston, 1895). See POLITICAL ECONOMY.

THUNNY. See TUNNY.

THUN UND HOHENSTEIN, tōon unt hō'en-stin, LEO, COUNT (1811-88). An Austrian statesman, born at Tetschen, in Bohemia. Before the revolution of 1848 he was secretary in the Imperial Chancery, and in that year became Governor of Bohemia. From 1849 to 1860 he was Minister of Public Worship and Instruction. He introduced many reforms in educational systems. In 1861 he was elected to the Bohemian Diet, where he became the leader of the Feudalists, and he continued this attitude in the Austrian House of Peers, which he entered in the same year. In 1867 he strenuously opposed the Ausgleich with Hungary. He retired from the Bohemian Diet in 1871, and reëntered it in 1883.

THURBER, GEORGE (1821-90). An American botanist, naturalist, and editor. He was born at Providence, R. I., where he obtained his early education. From 1850 to 1853 he was botanist, commissary, and quartermaster of the United States Boundary Commission upon the Mexican and United States borders, where he collected a large number of new species of plants. In 1856 he became lecturer upon botany and materia medica in the Cooper Union and College of Pharmacy of New York, and in 1859 professor of botany and horticulture in the Michigan Agricultural College, which institution he left in 1863 to become editor of the *American Agriculturist*, a post which he held until shortly before his death. In addition, he edited various horticultural and agricultural

books, and revised and in part rewrote Darlington's *Agricultural Botany*.

THUREAU-DANGIN, tu'rô'-dân'gân', PAUL (1837-1913). A French historian, born in Paris. He was educated at the Lycée Louis le Grand and afterward took up the study of law. In 1893 he was elected to the French Academy, of which he became the permanent secretary in 1908. His literary output, though not large, is notably scholarly. He wrote: *La Pologne et les traités de Vienne* (1863); *Paris, capitale pendant la révolution française* (1872); *Royalistes et républicains* (1874); *Le parti libéral sous la restauration; l'église et l'état sous la monarchie de juillet* (1879); *L'histoire de la monarchie de juillet* (7 vols., 1884-92), his most important work; *Histoire de la renaissance catholique en Angleterre au XIXe siècle* (1906; Eng. trans., ed. and rev. by Wilfred Wilberforce, 2 vols., 1914). He was several times awarded the Gobert prize by the French Academy.

THURET, tu'rá', GUSTAVE (1817-75). A French botanist, born in Paris. While attached to the French Embassy at Constantinople he collected plants in the Balkan Peninsula, and returned to France in 1844. His specialty was algae and his *Recherches sur les zoospores des algues et les anthéridées des cryptogames* (1851) were crowned by the academy. Other publications include *Recherches sur la fécondation des Fucacées* (1855-57), and numerous monographs, such as *Essai de classification des Nostochinées* (1875). He established a splendid botanical garden at Antibes, where he planted the first eucalyptus trees in Europe, and which he bequeathed to the state. He died at Nice.

THURGAU, tōor'gou, or THURGOVNE. A canton in the northeast of Switzerland, separated from Germany by Lake Constance (Map: Switzerland, D 1). Area, 381 square miles. The surface is elevated but not mountainous, and is cut by the valley of the Thur, the chief river of the canton. Almost the entire area of the canton is productive, and the chief occupations of the inhabitants are agriculture and viticulture. Stock raising and cheese making are also important industries. The principal manufactures are cotton and woolen goods, knit goods, machinery, leather, etc. The constitution of the canton, dating from 1869, is purely democratic, the members of the Legislative Assembly as well as of the Executive Council being elected directly by the people. The obligatory referendum and the initiative are in force. Pop., 1900, 113,221; 1910, 134,055, largely German-speaking Protestants. Capital, Frauenfeld (q.v.).

Prior to the ninth century the country known as Thurgau comprised almost the entire region bounded by Lake Lucerne, the Rhine, the Reuss, and Lake Constance. With the extinction of the house of Kyburg, Thurgau, reduced almost to its present size, passed in 1264 to the house of Hapsburg. In 1460 the country was seized by the Confederates and occupied the position of a subject district until 1798, when it was made a canton of the Helvetic Republic. In 1803 it was constituted a canton of the reorganized Swiss Confederation. Consult Meyer, *Thurgauisches Urkundenbuch* (Frauenfeld, 1881 et seq.), and Pupikofer, *Geschichte des Thurgaus* (ib., 1884-89).

THURIBLE. See CENSER.

THURIFER (Lat., incense bearer). The attendant in the Roman Catholic church, at solemn

mass, vespers, and other ceremonies, whose duty it is to carry the thurible, or incense vessel, and either to minister incense himself, or to present the thurible for that purpose to the officiating priest. The office of thurifer originally belonged to the so-called minor order of acolyte, but is now commonly exercised by laymen. See CENSER; INCENSE.

THURII. A city in Magna Græcia (southern Italy), founded by the people of the neighboring city of Sybaris (q.v.) after the destruction of the latter. In 443 B.C. a colony, of which Herodotus (q.v.) was a member, went from Athens to Thurii. For a long time the city prospered. It formed an alliance with the Romans in 282 B.C., but was plundered by Hannibal in 204 B.C. A Roman colony came to the city in 193 B.C., but the city declined presently and at last was wholly deserted. Only scanty ruins remain.

THÜRINGER WALD, tu'ring-ēr vält (Ger., Thuringian Forest). A mountain range of central Germany, extending from the banks of the Werra near Eisenach in a southeasterly direction to the north boundary of Bavaria, where it joins the Frankenwald, a ramification of the Fichtelgebirge (Map: Germany, D 3). It forms the southwest boundary of the trough of Thuringia, which in outward features resembles a plateau extending to the Harz Mountains. Length, about 70 miles; highest summit, Gross-Beerberg, 3238 feet. The range falls steeply towards the northeast and is covered to the summits with magnificent pine forests. The Triassic deposits which once clothed its surface have been worn away, exposing older granites, porphyries, and schists. It is rich in minerals, among which iron ore, copper, manganese, and gypsum are the most important. The range passes through a well-populated industrial region.

THÜRINGIA (Ger. *Thüringen*). A picturesque region of Germany, traversed by the Thüringer Wald (q.v.), lying between the Prussian Province of Saxony on the north and Bavaria on the south, and between the Kingdom of Saxony on the east and the Prussian Province of Hesse-Nassau on the west (Map: Germany, D 3). It embraces a number of duchies and principalities together with some Prussian districts. The so-called Thuringian states are Saxe-Weimar-Eisenach, Saxe-Coburg-Gotha, Saxe-Meiningen, Saxe-Altenburg, Schwarzburg-Rudolstadt, Schwarzburg-Sondershausen, and the two Reuss principalities. The largest city is Erfurt, in the Prussian Province of Saxony. The region took its name from the Thuringians, who at the time of the great migration of nations established an extensive kingdom near the centre of the present Germany. In the early part of the sixth century the Franks overthrew this kingdom, of which the northern part was joined to the country of the Saxons and the southern to Franconia. The name Thuringia came to be applied to the country between the rivers Werra and Saale and the Harz and Thuringian mountains. Under the weak Merovingian rulers dukes arose in this Thuringia, which for a time was virtually independent. Christianity was introduced in the eighth century. Under the Carolingian sovereigns Thuringia constituted an important frontier province or march, whose Governor was charged with the task of repressing or keeping down the Slavic Serbs. In the tenth century the country was under the rule of the dukes of Saxony. In the twelfth and thirteenth

centuries the landgraves of Thuringia held a prominent place among the German princes. They had their seat at the famous Castle of Wartburg. (See EISENACH.) Landgrave Hermann I (1190-1216) is noted as a patron of the minnesingers. The old dynasty of landgraves became extinct in 1247. The Landgraviate of Thuringia then passed to the house of Wettin, which ruled in the Margraviate of Meissen, and which in the fifteenth century came into possession of the electoral Duchy of Saxony. On the partition of the Saxon dominions in 1485 between the Ernestine and Albertine lines the bulk of the Thuringian possessions passed to the Ernestine or electoral branch. After the War of the Schmalkald League (1546-47) the Ernestine house was stripped of its possessions outside of Thuringia. Here arose the various modern Saxon (Thuringian) duchies. (See SAXE-WEIMAR.) Consult: Thomas Knockenhauer, *Geschichte Thüringens in der karolinischen und sächsischen Zeit* (Gotha, 1863); id., *Geschichte Thüringens zur Zeit des ersten Landgrafenhauses* (ib., 1871); Ernst Devrient, *Thüringische Geschichte* (Leipzig, 1907).

THURINGIAN FOREST. See THÜRINGER WALD.

THURLOE, thür'lo, JOHN (1616-68). An English Puritan statesman. After Cromwell was proclaimed Protector, Thurloe was appointed chief of the intelligence department, a position which he managed with striking fidelity and success. He continued as Secretary of State under Richard Cromwell until May, 1659, and in spite of royalist opposition in 1660 was reappointed prior to the Restoration. After Charles II's return he was arrested on a charge of high treason, but soon afterward was freed on condition of attending on the secretaries of state whenever they should require his service. His large collection of state papers and correspondence, comprising the most authentic materials respecting the period of the Civil War and Cromwell's Protectorate, were discovered in a secret recess in his chambers at Lincoln's Inn during the reign of William III, and are now in the Bodleian Library at Oxford. Dr. Thomas Birch issued a *Collection of State Papers; containing authentic memorials of the English affairs from the year 1638 to the Restoration of King Charles II, published from the originals, etc.*, prefixed by a *Life of Thurloe* (London, 1742).

THURLOW, EDWARD, BARON (1731-1806). An English lawyer. He was born at Bracon-Ash, Norfolk, was educated at Caius College, Cambridge, and was admitted to the bar in 1754. At this time he formed an intimate friendship with the poet William Cowper. Through the patronage of the Viscount Weymouth, Thurlow was elected to Parliament for Tamworth in 1768. In 1770 he was appointed Solicitor-General and the next year Attorney-General. He attracted the favorable notice of George III by zealously supporting the governmental policy of coercing the American Colonies, and in 1778 was made Baron Thurlow of Ashfield and Chancellor of the Exchequer, which office he retained under the Rockingham administration. Under the coalition ministry he was compelled to retire; but he was restored as Chancellor when Pitt came to power. For a time he supported the government; but, relying on the favor of the

King, he finally ventured to oppose the measures of his colleagues. Pitt then intimated that he or Thurlow must retire, and the King consented to the removal of Thurlow (1792). Consult Edward Foss, *Judges of England, with Sketches of their Lives* (London, 1848-64).

THURMAN, ALLEN GRANBERY (1813-95). An American political leader and legislator, born in Lynchburg, Va. In 1819 he was taken by his parents to Chillicothe, Ohio. He studied law in the office of his uncle, William Allen (1806-79; q.v.), became private secretary to Governor Robert Lucas in 1834, and in 1835 was admitted to the bar and became a partner of Allen. In 1845-47 he was a Democratic member of Congress, then resumed his law practice, and from 1851 to 1856 was on the bench of the Ohio Supreme Court, after December, 1854, as Chief Justice. In 1867 he was the Democratic candidate for Governor of Ohio, but was defeated by R. B. Hayes. From 1869 to 1881 he was a member of the United States Senate, and the leader of the Democrats in that body. In the Forty-sixth Congress he was elected President pro tempore of the Senate. He was active as an advocate of a liberal reconstruction policy, was one of the authors of the bill creating the Electoral Commission in 1876, and a member of that body. He was also the author of the well-known Thurman Act, designed to compel the Pacific railroads which had received government aid to fulfill their obligations to the government, and secured the passage of the bill. In 1881 he was appointed by President Garfield a member of the International Monetary Conference at Paris. In 1888 he was nominated by acclamation for Vice President on the Cleveland ticket, which was defeated by Harrison and Morton. Consult Hensel and Parker, *Lives and Public Services of Grover Cleveland and Allen G. Thurman* (Philadelphia, 1892).—His son, ALLEN W. THURMAN (born 1847), was prominent as a Democrat in Ohio and became president of the Special State Canal Commissioners.

THURN tōörn, HEINRICH MATTHIAS, COUNT (1580-1640). A leader of the Bohemian Protestants in the Thirty Years' War. For his services in the Turkish wars the Emperor Rudolph II made him Burgrave of Karlstein in Bohemia. He was among those who wrung from Rudolph the *Majestätsbrief* of 1609, an edict of toleration, and was named by the Bohemian estates one of the Thirty Defenders of the Faith. He was deprived of his estates and title soon after. On May 23, 1618, he gave the signal for the Protestant uprising in Bohemia by the defenestration of the Imperial legates at Prague. (See THIRTY YEARS' WAR.) At the head of the Protestant forces he besieged the Emperor Ferdinand II in Vienna (1619), but was finally compelled to withdraw. After the battle of the White Hill in 1620, in which the army of Frederick, the Protestant King of Bohemia, was vanquished, he sought refuge with Bethlen Gábor, ruler of Transylvania. In 1626 he commanded a corps in Silesia. Later he joined Gustavus Adolphus, and fought at Leipzig (1631) and Lützen (1632).

THURNEYSEN, tōörn'ti-zen, RUDOLPH (1857-). A German Celtic philologist. He was born in Basel, and studied at the universities of Basel, Leipzig, Berlin, and Paris. From 1882 to 1887 he was successively privatdocent and assistant professor of Romance philology in the University of Jena, and then was professor of

comparative philology at the University of Freiburg in Baden. In 1912 he was called to a similar chair at Bonn. He wrote: *Ueber Herkunft und Bildung der lateinischen Verla auf -io* (1879); *Das Verbum être und die französische Conjugation* (1882); *Keltoromanisches* (1884); *Der Saturnier* (1885); *Mittelirische Verslehren* (1891); *Sagen aus dem alten Irland* (1901); *Handbuch des altirischen* (2 vols., 1909).

THURSBY, EMMA (1857–). An American singer, born in Brooklyn, N. Y. She studied in the United States under Julius Meyer, Errani, and Madame Rudersdorf, and also abroad. She made a successful tour of the United States and Canada (1875), and was warmly received in England and France (1878–79), afterward being engaged by Maurice Strakosch as prima donna of his company (1880). A subsequent tour of the United States with Theodore Thomas was especially successful. In 1903 she made a tour of Japan and China. In her prime she was frequently compared with Patti.

THURSTON, JOHN MELLE (1847–1916). An American politician and lawyer, born in Montpelier, Vt. He removed to Wisconsin, where he was educated at Wayland Academy, Beaver Dam, in 1869 was admitted to the bar, and in the following year took up the practice of law at Omaha, Neb. He allied himself with the Republican party, and was elected to the State Legislature in 1875. In 1895–1901 he served as United States Senator and in the latter year was a commissioner for the Louisiana Purchase Exposition at St. Louis. He was chairman of the Republican National conventions in 1888 and 1896. From 1888 he was general counsel of the Union Pacific Railway.

THURSTON, KATHERINE CECIL (c.1864–1911). A British novelist, born in Cork, Ireland. In 1901 she was married to Ernest T. Thurston, an English novelist, from whom she subsequently secured a divorce. She is principally known for her novel *The Masquerader* (published in England as *John Chilcote, M.P.*, 1904), which had a large and deserved success. Other of her books include: *The Circle* (1903); *The Gambler* (1906); *Mystics* (1907); *The Fly on the Wheel* (1908); and *Max* (1910).

THURSTON, ROBERT HENRY (1839–1903). An American engineer and educator, born in Providence, R. I. He graduated at Brown University in 1859. During the Civil War he served in the Federal navy as an engineer, and in 1865 he was appointed assistant professor of natural and experimental philosophy at Annapolis. He was professor of engineering at Stevens Institute of Technology from 1871 to 1885, and in the latter year conducted a series of important experiments on steam boilers. Thurston was a member of the United States Scientific Commission to the Vienna Exhibition in 1873, and edited the *Report of the commissioners*, which included his individual report on machinery and manufactures (1875–76). From 1885 till his death he was director of Sibley College, Cornell, and professor of mechanical engineering in the university. His thoroughness, organizing ability, and genius as a teacher placed him in the front rank of educators in his field. His writings, notably influential because clear, comprehensible, and reliable, include: *A History of the Growth of the Steam Engine* (1878; 4th ed., rev., 1902; Ger. and Fr. trans.);

Manual of Steam Boilers (1888; 7th ed., 1901); *Manual of the Steam Engine* (1891; 5th ed., 1900–02); *Materials of Engineering* (3 vols., 1883–84; new ed., 1907–10); *Stationary Steam Engines* (1884; 7th ed., 1902); *Treatise on Friction and Lost Work in Machinery and Mill Work* (1885; 7th ed., 1903); *A Handbook of Engine and Boiler Trials, and of the Indicator and Prony Brake* (1890; 5th ed., 1903); *A Text-book of the Materials of Construction* (1890; 6th ed., 1900); *Life of Robert Fulton* (1891). Professor Thurston's inventions include a magnesium-ribbon lamp, a magnesium-burning naval and army signal apparatus, and autographic recording and testing machine, a steam-engine governor, and an apparatus for determining the value of lubricants. From 1880 to 1883 he served as first president of the American Society of Mechanical Engineers. Consult W. F. Durand, *Robert Henry Thurston* (Washington, 1904).

THURY, tɥ'rɛ', VICOMTE DE. See HERICART-FERRAND, L. E. F.

THUSNELDA. See GERMANICUS CÆSAR.

THWAITES, thwäts, REUBEN GOLD (1853–1913). An American historical writer, born in Dorchester, Mass. In 1866 he removed to Wisconsin. From 1876 to 1886 he was managing editor of the *Wisconsin State Journal*, at Madison. From 1886 he was secretary and superintendent of the State Historical Society of Wisconsin. In 1899 he was president of the American Library Association. He edited the *Wisconsin Historical Collections* (vols. xi–xix, 1888–1911); *The Jesuit Relations* (73 vols., 1896–1901); *Early Western Travels, 1748–1846* (32 vols., 1904–07); *Original Journals of Lewis and Clark* (7 vols., 1905); and similar works. He also published: *Down Historic Waterways* (1888; 2d ed., rev., 1902); *The Colonies, 1492–1750* (1891); *Daniel Boone* (1902); *Father Marquette* (1902); *George Rogers Clark* (1903); *Brief History of Rocky Mountain Exploration* (1904); *France in America* (1905); *Wisconsin* (1909); *School History of the United States* (1912). For a critical analysis of the work of Thwaites consult an article by C. W. Alvord, *Proceedings of the Mississippi Valley Historical Association* (Cedar Rapids, Ia., 1913–14); consult also F. J. Turner, *Reuben Gold Thwaites* (Madison, Wis., 1914).

THWING, twing, CHARLES FRANKLIN (1853–). An American clergyman and educator, born at New Sharon, Me. He graduated from Harvard in 1876, and from the Andover Theological Seminary in 1879; was pastor of churches in Cambridge, Mass., and in Minneapolis, and in 1890 became president of Adelbert College and Western Reserve University at Cleveland, Ohio. He published: *The Reading of Books* (1883); *The Family* (1886; 2d ed., 1913), with Carrie F. Butler Thwing; *Within College Walls* (1893); *College Administration* (1900); *History of Higher Education in America* (1906); *Education in the Far East* (1909); *A History of Education in the United States since the Civil War* (1910); *Universities of the World* (1911); *Letters from a Father to his Son Entering College* (1912); *Letters from a Father to his Daughter Entering College* (1913); *The American College* (1914).

THYESTES, thî-ēs'têz (Lat., from Gk. Θέστης). The son of Pelops (q.v.) and Hippodamia. Having seduced Ærope, the wife of his brother Atreus (q.v.), he was banished from Mycenæ

(q.v.), and in revenge sent Plisthenes, the son of Atreus, whom he had brought up, to slay his father. Atreus, not recognizing Plisthenes, killed him. In revenge, summoning Thyestes to Mycenæ, he placed before him at a feast the flesh of Thyestes' two sons.

THYLACINE. See DASYURE.

THYME, tīm (OF., Fr. *thym*, from Lat. *thymum*, from Gk. *θύμον*, *thymos*, thyme, sweetbread, warty excrescence; connected with *thōs*, *thyos*, incense), *Thymus*. A genus of humble half-shrubby plants, of the family Labiatae, having a two-lipped calyx and four diverging stamens.

GARDEN THYME.

Garden thyme (*Thymus vulgaris*) is 6 to 10 inches high, with narrow, almost linear leaves, and whitish or reddish flowers, which grow in separate whorls, six in a whorl. It is common upon dry hills in southern Europe, and is cultivated in gardens for its fragrance and as a culinary herb. It is also used in medicine. Wild thyme (*Thymus serpyllum*) has a procumbent stem with many branches, 2 to 3 feet long, oval leaves, and purplish flowers, arranged in whorls, which are united in a head. It is abundant on hills and mountains in all parts of Europe and northern Asia. It is less fragrant than garden thyme, but both species contain an aromatic essential oil.

The lemon thyme, or lemon-scented thyme, is a variety of *Thymus serpyllum*, generally of lower growth than the common thyme. No species is indigenous in America.

THYMOL, tīm'ol or -ōl. The active principle of the oil of thyme, having powerful antiseptic and anæsthetic properties. Its chemical formula is $C_{10}H_{14}O$. It occurs in large, colorless plates, having a thymelike odor, which are slightly soluble in water and readily soluble in alcohol. Besides its employment in the form of a spray in infections of the upper respiratory tract, it is given in intestinal affections and is almost a specific in hookworm disease (q.v.).

THYMUS GLAND (Neo-Lat., from Gk. *θύμος*, *thymos*, so called from its fancied resemblance to a branch of sweet thyme). A ductless gland, peculiar to infantile life. In the human being it occupies a space in the neck below the thyroid gland and in the chest beneath the sternum in the anterior mediastinal space, on the level of the fourth costal cartilage. The gland is developed early in fetal life, increases in size during the first two or three years of life, then remains stationary until the tenth to the fourteenth year, when it begins to atrophy and undergo fatty degeneration. At its maximum development the organ is over 2 inches long, $1\frac{1}{2}$ inches broad, and about $\frac{1}{2}$ of an inch thick. At birth its weight is normally about half an ounce. Comparatively little is known of the function of this organ, but it is believed to manufacture an internal secretion, which has a profound influence on growth and development, and is concerned in the retention of the calcium salts by the body for the formation of bone. The thymus gland of young animals such as

the lamb and calf constitutes the delicacy known as sweetbreads, though the pancreas or belly sweetbread of certain animals is often substituted in trade for this article. Thymus has been used in medicine in the treatment of malnutrition, delayed growth, rickets, and rheumatoid arthritis. See ALIMENTARY SYSTEM; ORGANOTHERAPY.

THY'NI. See BITHYNIA.

THYROID GLAND (from Gk. *θυρεοειδής*, *thyreoeidēs*, shield-shaped, from *θυρεός*, *thyreos*, large oblong shield, from *θύρα*, *thyra*, door + *eidos*, *eidos*, form). One of the ductless or vascular glands, lying at the upper part of the trachea, and consisting of two lateral lobes, placed one on each side of this canal, and connected together by a narrow transverse portion at the lower third, called the isthmus. It is of a brownish-red color and its normal weight is about an ounce. Each lobe is somewhat conical, and is about 2 inches long and $\frac{3}{4}$ of an inch broad. Minute examination of the gland shows it to consist of lobes and lobules held together by connective tissue. Each lobule is made up of numerous completely closed sacs 0.04 to 0.1 inch in diameter. The sacs contain a transparent, viscid, albuminous fluid. Each sac is surrounded by a plexus of capillary blood vessels which do not pierce the lining of the sacs. Numerous lymphatic vessels are also present. At an early period the sacs dilate, their cellular lining atrophies, and their contents undergo colloid degeneration. The function of the thyroid gland is mainly the production of an internal secretion which influences bodily nutrition in many ways. It is subject to several varieties of enlargement known under the general name of goitre, and is also the seat of various benign and malignant tumors. *Myxœdema* (q.v.) is a condition of the system brought about through loss of function of the thyroid gland, either from atrophy or removal of the organ. The prepared extract of the thyroid gland of the sheep is used in the treatment of this condition. See ALIMENTARY SYSTEM; CRETINISM; ORGANOTHERAPY; SECRETIONS, INTERNAL.

THYR/SUS (Lat., from Gk. *θύρος*, stalk, stem). An ivy and vine wreathed staff tipped with a pine cone, which was carried by Bacchus (q.v.) and his followers in their religious rites.

THYSSEN, tēs'sen, AUGUST (1840-1926). A German industrial leader. He engaged in the iron industry in the late sixties at Duisburg, but after 1871 lived at Mülheim-Ruhr, where he founded the firm of Thyssen and Company, the parent house of his many industrial interests. He became the chief owner of a mining company employing about 18,000 men, of 641 coke ovens, and of 7 blast furnaces. He built the first 500-ton blast furnace in Germany, the first 100-ton Martin furnace, and the first large tube works.

TI, tē (Polynesian name), *Cordyline terminalis*. A treelike plant of the family Liliacæ, found in southeastern Asia, the eastern Archipelago, and the Hawaiian and other Pacific islands. It sometimes exceeds 12 feet in height. The reddish, lanceolate leaves are used as cattle food and as thatch for houses, as food wrappers, etc. Their fibres are sometimes made into cloth. The large, hard, fibrous, and almost insipid root becomes soft and sweet when baked. It is very nutritious, and is much used as an article of food. The juice is used for making sugar, a fermented beverage, and a distilled liquor. Fully 25 varieties of *Cordyline*

are grown under glass for their ornamental, often variegated, foliage. See HOG PLUM.

TIAHUANACO, tē-ä'wä-nä'kō. A ruined city of Bolivia, a few miles from the Peruvian frontier, on an arid plain midway between lakes Titicaca and Aullagas, at an elevation of 12,900 feet. The present town of the same name stands a short distance from the ruins and is built for the most part of beautifully cut stones from the ancient buildings. In the ruined town five great structures besides an equal number of shapeless mounds may be traced. These buildings are commonly known as the Fortress, the Temple, the Palace, the Hall of Justice, and the Sanctuary. The fortress consists of a rectangular mass of earth 620 feet long, 450 feet wide, and about 50 feet high, supported by walls of stone forming terraces, the walls sloping inward. On the summit are traces of rectangular buildings. Adjoining the pyramid to the east is a rectangular apron mound. The Fortress has been almost destroyed by excavations for treasures, but these diggings show that there were subterranean structures within the mound. All the buildings of Tiahuanaco are oriented to within 10 degrees of the cardinal points. The Temple, believed to be the oldest building here, is a rectangle 388 by 455 feet, defined by erect stones between 8 and 10 feet high, 2 by 4 feet broad, and from 20 to 30 inches thick. On the eastern side, aligned along a lower terrace, are 10 columns about 15 feet high, by 4 feet by 3 feet. The interior of the rectangle is raised 8 feet above the level of the ground and has a sunken court 280 feet long and 190 feet broad. To the east of the Temple is the Palace, of which the massive foundation remains, composed of blocks of trachyte 8 to 10 feet long and 5 feet wide. The piers of this building are deeply sunk in the ground and rest on a pavement of cut stones. The Hall of Justice stood at one end of a sunken court in a rectangle in plan like that of the Temple. It was a platform 131 feet long and 23 broad, built of enormous blocks of stone, and had three groups of alcoves or seats arranged at the ends and in the centre, and between the central and side groups were monolithic doorways with sculptured friezes. The Hall of Justice also stands on a raised area, in the centre of which was a building about 50 feet square, constructed of very large stones, and called the Sanctuary. Within the building is a slab of stone 13 feet 4 inches square and 20 inches thick. On its surface is cut what seems to be the plan of a building resembling that of the Fortress, and six niches in which perhaps statues were located.

Tiahuanaco is famous for its great monolithic gateway of hard trachyte 13 feet 5 inches long, 7 feet 2 inches high above ground, and 18 inches thick. The lintel over the front of the gateway is sculptured in low relief and the back is carved to represent doors and windows. The masonry at Tiahuanaco is laid without mortar, the stones on each course are tongued and grooved at the ends, and bronze pins and T-clamps were employed to hold the courses in place. Earlier travelers speak of statuary at Tiahuanaco, but these pieces have been destroyed except a head, which belonged to a figure probably about 18 feet high. The building stone was transported from 15 to 40 miles and the dressing was done with bronze and stone tools. There is no reliable tradition as to the builders, who it is supposed were the Incas or Aymaras, and no reason can

be assigned for the location of the city on a barren plain at a great altitude, unless it be that the foundation was determined by religious ideas. Consult Stübel and Uhle, *Die Ruinenstätte von Tiahuanaco* (Breslau, 1892).

TIAN-SHAN, tē-ün' shän', or **CELESTIAL MOUNTAINS**. A great mountain system of Central Asia 1500 miles long (Map: Asia, J, K 4). It begins near the Desert of Gobi in a rocky crest, and, running southwestward, is joined by a second, a third, and many other ranges, which, as they advance westward, open out more or less fanwise, the several ranges being connected by intervening plateaus, and continuing to preserve somewhat of a parallel direction. Towards the centre the plateau is 250 miles wide, while to the west the ridges become reduced in number, and sink into the plains about Tashkend, in southeast Russian Turkestan. It forms the north boundary of the great Tarim Basin, which it separates from the watersheds of Lake Balkash and the Syr-Darya. It is connected by broken ranges with the Altai Mountains to the north, and, through the Sarikal, with the Kuen-lun, Hindu-Kush, and Himalaya systems. In the central portion there is a main ridge forming an unbroken wall covered with perpetual snow throughout its length, and culminating in the west in the Khan-Tengri, a peak bearing enormous glaciers and reaching an altitude of 24,000 feet. East of this ridge the mountains descend in a broad plateau with scattered peaks and ridges from 6000 to 10,000 feet high. In the west portion there are several important passes affording routes between Russian and East Turkestan. The system incloses numerous large longitudinal valleys whose bottoms form wide steppe regions. Above, the slopes are covered with spruce forests succeeded by an alpine flora to the snow line. The loftiest group in the eastern portion, the Bogdo-ola, is held sacred by the Mongolians. Consult Gottfried Merzbacher, *Central Tian-Shan Mountains* (New York, 1905).

TIARA, ti-ä'rä or tē-ä'rä (Lat. *tiara*, *tiaras*, from Gk. *τιάρα*, *τιάρης*, headdress of the Persian kings). The triple crown of the Pope. Although a cap called a tiara was worn by some Oriental monarchs, as by the Achæmenid dynasty of Persia, as an ecclesiastical headdress it has more affinity with that of the Jewish high priests, the form of which is more or less preserved in the mitres worn by the bishops of the Eastern church to-day. (See **COSTUME**, **ECCLESIASTICAL**.) It is composed of a high cap of gold cloth, encircled by three coronets, with a mound and cross of gold on the top. From the cap hang two pendants, embroidered and fringed at the ends. The original papal crown consisted of the cap alone, and was first used by Pope Nicholas I (858-867). Alexander II added a second coronet about 1065, and Urban V (1362-70) the third. A symbolic meaning has since been found in the triple crown, as representing the authority of the Pope over the Church militant, expectant, and triumphant. It is placed on the Pope's head at his coronation by the second cardinal deacon, with the words "Receive the tiara, adorned with three crowns, and know that thou art father of princes and kings, ruler of the world, vicar of our Saviour Jesus Christ." At ceremonies of a purely spiritual character the Pope wears the mitre, like other bishops, not the tiara. See **CROWN**.

TIBALDI, tē-bäl'dē, **PELLEGRINO** (1527-98).

An Italian architect and painter, born at Bologna. A pupil of Daniele da Volterra in painting, he subsequently worked both as an architect and painter under the influence of Michelangelo in Rome, whither he had gone in 1547. His graceful altar pieces, especially attractive through the loveliness of the female heads, are very rare. Of his frescoes "Hercules Taming the Animals" may still be seen in the Loggia dei Mercanti (Exchange) at Ancona. He is important also as an architect of the late Renaissance, especially in Milan where (1560-70) he designed the Jesuit church of San Fedele, reconstructed the archiepiscopal palace, and designed the baroque façade of the cathedral. Called to Madrid by Philip II in 1586 to take part in the erection of the Escorial, Tibaldi also decorated its library with warmly colored frescoes, was created Marchese di Valsolda, and after nine years returned to Milan, where he died. Consult Zanotti, *Le pitture di Pellegrino Tibaldi* (Venice, 1756), and Gurlitt, *Der Barockstil in Italien* (Stuttgart, 1887).

TIB'BUS, **TIBUS**, or **TUBUS** (rock people). A people inhabiting Tibesti, in the eastern Sahara, and extending southward into the Sudan. Von Luschan regards them as possibly related to the central Sudanese negroes such as the Kanuri. In these different areas they vary greatly in hair and features. There are only 70,000 of them spread over an area of 300,000 square miles, under the names, Tedas, Dasas, Bedeyat, Zoghawa, and Bulzeda. For generations they have been active in the traffic by caravan across the Sahara. In religion they are Mohammedan. Consult Rohlfis, *Quer durch Afrika*, vol. i (Leipzig, 1874), and Nachtigal, *Sahara und Sudan* (Berlin, 1879-89).

TIBER (Lat. *Tiberis*, poetical *Thybris*; Ital. *Tevere*). The principal river of central Italy. It rises in Tuscany, at the south of the Monte Fumajolo, in the Province of Arezzo, about 30 miles east of the source of the Arno, at an altitude of more than 3600 feet above the level of the sea, and flows towards the south in a winding course, across Perugia (Umbria). After receiving the waters of many small streams, at Orte, where it is joined by the Nera (the ancient Nar), it forms the boundary between Umbria and Rome, encircling Mount Soracte and entering the Campagna Romana (Map: Italy, D 4). About three miles above Rome it is swelled by the Anio (now Aniene or Teverone), then passes through the city of Rome, where it forms an island, the *Insula Tiberina* (now *Isola di San Bartolommeo*), and enters the Tyrrhenian Sea about 26 miles below.

The total length of the Tiber is 245 miles; its breadth at Rome is about 250 feet. It is a swift-running stream, carrying down an enormous amount of alluvial matter, which, in solution, gives the water that yellowish color for which the fluvius Tiberis was renowned. The sediment deposited at the mouth of the Tiber is pushing out the land at the rate of about ten feet a year, so that the ruins of Ostia, the ancient harbor of Rome, are now more than four miles inland. The delta is formed of two mouths; the fumicino, originally a channel dug by Trajan for his harbor (Portus Traiani), now the larger and navigable branch, and the fumara, now almost choked by sand banks; and these inclose the *Isola Sacra*, a desolate and unhealthy island once sacred to a Venus. The Tiber is navigable by small steamers as far as Rome, and

by smaller craft 60 miles higher up. It is subject to frequent and often disastrous inundations, of which the ancient writers have recorded no less than 23. Among the more famous floods are that mentioned by Horace (*Odes*, 1, 2), that of 1598, when the water at Rome rose 51½ feet, and that of 1900, when it reached a flood height of almost 54 feet. To remedy this evil, the government, beginning in 1876, constructed massive embankments at Rome, at the expense of more than \$25,000,000; but the carefully planned work has proved defective. The stream on the north of the Tiber island has become clogged with sand, and in the flood of 1900 fully a quarter of a mile of the south embankment was carried away by the water. Consult Narducci, *Saggio di Bibliografia del Tevere* (Rome, 1876), and S. A. Smith, *The Tiber and its Tributaries* (London, 1877).

TIBE'RIAS, LAKE or SEA OF. A lake in Palestine. See GALILEE, SEA OF.

TIBE'RII CAS'TRUM. The Roman name of the site now occupied by the Bavarian town of Lindau (q.v.).

TIBE'RIOUS (**TIBERIUS CLAUDIUS NERO CÆSAR**) (42 B.C.-37 A.D.). The second Emperor of Rome (14-37 A.D.). He was the son of Tiberius Claudius Nero and Livia Drusilla (q.v.), and was adopted by Augustus (q.v.) when the latter married Livia in 38 B.C., after her compulsory divorce. He was carefully educated, and early manifested intellectual power and military skill. His first important command was the expedition sent in 20 B.C. to restore Tigranes (q.v.) to the throne of Armenia. A more noteworthy commission was given him in 15 B.C., when, in company with his younger brother Drusus (q.v.), he defeated the Rhætians. Two years later he was consul with P. Quinctilius Varus, and in 11 B.C. he fought successfully against the Dalmatians and Pannonians. The death of Drusus in 9 B.C. recalled Tiberius to Germany, but in 7 B.C. he recalled the consulship for the second time. The troubles which were to overshadow his life had, however, already begun. In 11 B.C. he had been forced by Augustus to divorce his wife, Vipsania Agrippina, whom he loved deeply, and to marry the Emperor's daughter Julia, the widow of Marcus Vipsanius Agrippa (q.v.). Her conduct, and perhaps his own jealousy of the growing favor of Gaius and Lucius Cæsar, the two grandsons of Augustus, children of Julia and Agrippa, led him to retire, against the Emperor's will, to Rhodes in 6 B.C., the year in which the tribunician power was conferred upon him for five years. He remained in Rhodes seven years, and before his return Julia had been banished for life to the island of Pandataria. The death of Lucius Cæsar in 2 A.D. and of Gaius in 4 led Augustus to adopt Tiberius as his heir. From this time until the Emperor's death Tiberius was in command of the Roman armies, and campaign followed campaign. In 4 A.D. he reduced Germany from the Rhine to the Elbe, from 6 to 9 he waged war again in Dalmatia and Pannonia, and from 10 to 11 he held the Rhine against the Germans who had defeated Varus (q.v.). In 12 he was honored with a well-earned triumph.

When the death of Augustus occurred, August 19, 14, Tiberius was on his way to Illyricum. He was summoned home by his mother, and at once assumed control of the Empire. Despite his execution of Postumus Agrippa, the grandson

of Augustus, his reign was at first beneficent. Gradually, however, a change took place in Tiberius. He minimized the power of the people, and transferred the election of magistrates from them to the Senate. At the same time he watched with suspicion the increasing popularity of Germanicus Cæsar (q.v.), his nephew. In 19 Germanicus died, poisoned, reports current at the time declared, at the instigation of his uncle. About this time the evil genius of the reign of Tiberius, Ælius Sejanus (q.v.), gained his ascendancy over the Emperor. Under his influence a system of espionage was instituted which doomed all who in any way opposed Tiberius. Freedom was abolished in Rome, the Senate was demoralized, and the Emperor sank to the level of a cruel and ruthless tyrant. In 23 Sejanus abetted the murder of the only son of Tiberius, Drusus Cæsar (q.v.). Three years later the Emperor left Rome with Sejanus, going first to Campania and in 27 to Capri, where he remained till his death.

In 29 Livia Drusilla died, thus removing one of the last barriers to the complete degeneration of her son. Two years later Tiberius learned of the treachery and ambition of Sejanus, who was put to death, only to be replaced by Macro, as corrupt as his predecessor. In 37 Tiberius died, smothered, though already on his death bed, by Macro, and was succeeded by Caligula (q.v.). The reign of Tiberius was beneficial to the Empire at large, and the provinces especially flourished under his sway. Only in Rome, and only where his personal interests were at stake, was he merciless.

The writings of Tiberius have been lost. His style is said to have been obscure, archaic, and affected. He wrote a brief autobiography, a lyric on the death of Lucius Cæsar, and a number of Greek poems.

TIBERIUS CLAUDIUS. See **CLAUDIUS I. TIBET**, or **THIBET**, *tib'et* or *ti-bët'*. A province in Central Asia forming the southwest part of China, and under the suzerainty of that country. In its main features it is now fairly well known through the efforts of many explorers, in spite of the policy of exclusion. The name long covered half of Kashmir in the west occupied by peoples of Tibetan origin. But three regions are now excluded from Tibet: (1) Little Tibet, between 74° and 79° east long., now included in Kashmir, and composed of Baltistan and Ladakh (qq.v.); (2) and (3) the two regions known as Ku-kun-nor and the Ts'aidam, or Ch'aidam, lying south of the Nanshan, east of the Altin-tagh, and north of the curve formed by the eastern and southeastern extension of the Kuen-lun system, bearing the names of Akka, Tolai, Angirtkshia, Barkhan-Bhōba, Shuga, etc. Area, 463,200 square miles.

Physical Features. Tibet is the highest and most massive plateau in the world, suspended between the two great continental chains of the Kuen-lun and the Himalaya. This lofty tableland contrasts sharply with the lowlands of Hindustan on one side of it and the desert of the Tarim basin on the other, the latter being one of the lowest depressions in the interior of any continent; so that the highest plateau on the earth's surface rises close to one of the deepest depressions in the interior of the dry land. Within the mountains forming the periphery of this wide-spreading highland three distinct physical features may be recognized: (1) The great plain stretching away from the western confines of Tibet for about 700 miles east and spanning the parallels of latitude between the Kuen-lun and the valley of the Sanpo, which collects the northern drainage of the Himalaya; (2) the valleys and ranges of south Tibet, including the valley of the Sanpo or upper Brahmaputra; and (3) the intricate system of ranges and gorges in the east and southeast which contain the sources of great rivers of China, Indo-China, Siam, and Burma.

The tableland or high plateau has an elevation of 14,000 to 17,000 feet in the west and slopes very gradually to the east and south. Some important areas have not yet been visited, but explorers' routes seem to show that most of the surface is a mass of mountains and valleys, the elevations rising from 2000 to 3000 feet above the plain. A great many depressions contain lakes which are salt unless they are drained to other lakes, the entire hydrography being a system of closed basins.

The long east and west depression of south Tibet is still very high land, its ranges running parallel with the Himalaya and its fertile valleys containing most of the population of Tibet. The valley of the Sanpo is most important both for agriculture and transportation. In this southern part of the country are the seat of the government and the centres of culture and refinement; and far in the west of south Tibet, within a few days' march of one another, are the sources of three great rivers—the Brahmaputra, Sutlej, and Indus.

Eastern Tibet is a mass of ranges, partly covered with timber. It has more streams that rise in neighboring valleys, but reach different seas as great rivers, than any other part of the world. The mountains among which they rise have a larger rainfall than the plains to the west, for they are reached by moist winds from the Indian Ocean. Thus the headwaters of the Hoang, the Yangtse, the Mekong, and the Salwin rivers are already important streams before leaving Tibet. These highlands, 15 times more extensive than the Alps, are not so well known as the western plateau.

Climate. Owing to the dryness of the air, precipitation, either as rain or snow, is small except among the eastern ranges to which humid winds have access. The climate, however, is severe on account of the great elevation in latitudes corresponding with those of the Mississippi delta and Memphis. Explorers have found the winter cold, combined with deficiency of oxygen on the plateau, almost unendurable, and several of them have lost all their pack animals. The rarefaction of the air and the clearness of the sky give the rays of the summer sun full power and the hottest of days are often succeeded by night temperatures below freezing. The extremes

of temperature are less in the partly wooded and lower levels of east and south Tibet.

Flora. Trees do not grow on the table-lands except in sheltered depressions, and then they are stunted. It has been settled that the flora, so far as the northern and eastern sections are concerned, belongs to the Arctic alpine division of the great northern region. In the south, the hot summer days, with irrigation, perfect a large variety of fruits and farm products. In the sheltered valleys of southeast and east Tibet are forests of timber still untouched.

Fauna. This includes the wild yak (*Poëphagus grunniens*), antelope, gazelle, kyang or wild ass (*Equus hemionus*), nyang or mountain sheep and goats (found above an elevation of 15,000 feet), wolf, fox, wild dog, bear (regarded by the natives with dread as the primitive speechless wild man and hence unmolested), musk deer, and hare. In game birds—especially in eastern Tibet—there are the sand grouse, several species of pheasant, ducks, teal, the bar-headed goose, coolen, etc. Among the domestic animals are the horse, sheep, cat, and dog, but no fowls. Song birds are not found, except as birds of passage.

Mineral Resources. Clay, slate, granite, quartz, and limestone are the chief materials forming the mountain ranges. The country is known to be extremely rich in minerals, and gold, silver, iron, and coal are prominent. Gold washing is a common occupation both in the east and west. In Thok Jolang, in the southwest part of the Chang-tang, Litledale found mining operations carried on six months of the year, exclusively by Lhasa people. Lapis lazuli and other semiprecious stones, as well as gems, are extensively used for personal adornment by both sexes, and it is supposed the country must be rich in these. The Kuen-lun Mountains have for many centuries been the chief source of the jade supplies of China.

Agriculture. Farming and the tending of flocks and herds are the chief occupations, but, owing to the elevated and rugged nature of the country, both are attended with many hardships. The Chang-tang (north plain) has some grass, but it is only at elevations less than 13,500 feet that the growing of barley—the hardiest of all the cereals, and the chief article of food in Tibet—becomes possible. The other crops are wheat, buckwheat, cabbages, potatoes, turnips, radishes, and pulse, and among the fruits, apples, apricots (especially in the western province), and peaches, and in the south pomegranates and jujubes. In much of the extreme south agriculture in the valleys is in a flourishing condition.

Industries. Tibet has no factories, but many minor industries are carried on in the settled districts, and the people are reputed to be skillful weavers, potters, and metal workers. Many women embroider artistically with gold thread and colored silks and manufacture large quantities of felt. An excellent kind of serge called *pulo* is produced everywhere.

Commerce. The chief products of Tibet are wool, lambskins, lynx, fox, leopard, and other skins, yak tails, used in India as chowries or flyflaps, deers' horns, musk, rhubarb, gold dust, precious stones, borax, nitre, salt, and live stock. Much of the wool (from goats) goes to Kashmir to be manufactured into Kashmir shawls. In exchange for these Tibet receives tea, cotton, and cotton goods, silk, sugar, and tobacco from both

China and India; satins, gold brocades, red leather, chinaware, gun barrels, hardware, drugs, and flour from China; leather and saddles from Mongolia; broadcloth, indigo, spices, coral beads, and pearls from India; and rice from Sikkim. Owing to the failure of Tibet to keep Yatung, near the Indian frontier, open to trade, the Indian government sent an armed mission to Tibet in 1904 (the Younghusband expedition), which compelled the Tibetans to open Yatung, Gyantse, and Gartok to British trade, and British agents are now established at those towns. The treaty signed by Tibet also provides that all forts between the Indian frontier and Gyantse on routes traversed by merchants shall be destroyed and that no customs duties shall be imposed upon merchandise excepting those agreed upon by Great Britain and Tibet.

Transportation and Communication. Lhasa, the capital, is the great central mart, from which trade routes radiate in all directions. There are three highroads from Lhasa to the Chinese border and others to various points on the frontier of Mongolia, Bhutan, and India and through southern Tibet, from Lhasa to Gartok, 700 miles. Transportation is difficult and tedious, most of these journeys requiring months to complete. Robbers are numerous and bold, hence traders travel in large companies; the pack animals are yaks, mules, ponies, and, where the road is too stony for the yak, sheep are used, one sheep carrying 25 to 30 pounds. Food, fodder, and tents must be carried; the passes are precipitous and frequently blocked with snow. The animals are never housed by the way, and the mortality among them is very great. In the settled parts of the country the streams are usually bridged, or if unfordable they can be crossed in round wickerwork boats covered with skins, the animals swimming.

Government. At the present day the government of Tibet is in a very uncertain state, because the country claims independence of China, to which China does not agree, and because of the great increase of British influence over Tibetan affairs since the Younghusband expedition of 1904 and the Simla Conference of 1913-14. Before the present unrest the government was as follows: At the head stood the Dalai Lama, theoretically an absolute ruler, residing in the Potala or palace near Lhasa. Practically, however, his action was restrained to spiritual affairs, and he was represented in political matters by a regent, chosen for life by the Chinese government from among the chief lamas. This regent, in rank a step below the Dalai Lama, was supposed to be the most learned lama in the country. Then came four ministers of state, one of them a lama and the other three laymen. The one who had served longest was Prime Minister. Behind this machinery were two Ambans who represented Chinese authority and had charge of foreign and military affairs. Both the civil and religious duties were largely in the hands of Tibetans. There were courts of justice with two judges residing in Lhasa.

Population. Officially, the population of Tibet is given as 6,430,000, and by the Chinese Michengpu census of 1910 as 6,500,000, about 14 to the square mile. But these figures are far too high. Little estimates the number at about 1,000,000, and Père Richard at from 2,000,000 to 3,000,000. Rockhill estimates the population of central Tibet during the middle of last century at 1,500,000, and this same authority regards

the present population of the entire area now known as Tibet as 3,500,000, which is no doubt near the truth. Many influences are at work to keep down the population, among which may be mentioned the absence of immigration, the prevalence of polyandry and of celibacy among the lamaists, and the great hardships of life among conditions that render the struggle for existence intense and incessant.

Religion. Bön, the indigenous religion of the country, is a kind of Shamanism (q.v.). It still has many adherents, especially in eastern Tibet; but the state religion, and the prevailing one, is the corrupt form of Buddhism called Lamaism (q.v.). There are several sects, but the most powerful is the Gelugpa, which constitutes the established church. (See TSONG-K'A-PA.) For the mass both of lamas and people religion is reduced to a system of magic in which worship has no object except to conjure the evil spirits. Followers of this sect wear yellow caps as distinct from the unreformed Nyingmepas, who wear red caps, and are the next most powerful sect. The lamas or monks are very numerous and dwell in great lamaseries, of which there are a great number. The largest is 7 miles west of Lhasa, and is known as the Dupon monastery. It is a city in itself and accommodates at present 7500 lamas. Here is the Great Oracle of State, operated by supposedly inspired lamas. Its influence is even greater than ancient Delphi. The Sera monastery at Lhasa has 5500 lamas, and the Gandan monastery about 2000. These 15,000 lamas practically control the country, and at times even the Dalai Lama and the Ambans are forced to give way to them. The power and richness of the monasteries increase yearly, and education is chiefly in their hands.

Ethnology. Judged by their language alone, Tibetans proper belong to the Tibeto-Indo-Chinese branch of Keane's *Homo Mongolicus*. Physically, however, they exhibit marked variations, there being present at least two types—one Mongoloid, the other a somewhat slender figure, thin, prominent, often aquiline nose, straight eyes, and long, sometimes wavy hair. In the permanently settled portions of the country, where centres of population have existed for centuries, the people have varied considerably from the original type, the result being a mixed race, becoming more Chinese as one goes towards China, or more Indian (Nepalese or Kashmiri) as one travels southward or westward. This mixture is in part due to the concubinage of native women with foreign traders, soldiers, pilgrims, officials, etc., and in part to the system of polyandry. Monogamy prevails among the nomads, but elsewhere polyandry is common, one woman becoming the wife of the brothers of a family, the oldest being considered the father of all the children, the others being regarded merely as uncles. There is also some polygamy among the wealthy, as in China.

History. The early history of Tibet is legendary and obscure. In the middle of the eighth century Tibet extended from Kuku Nor and Ladakh on the north into India in the south, while on the east the tribesmen came into frequent conflict with China, and it is recorded that they even entered Chang-an, the capital, in 763. In 747 the famous Indian wizard and teacher, Padma-sambhava, had arrived; he made a long missionary journey through the country, everywhere vanquishing the Shamanistic devils, and laid the foundation of Lamaism. In 749 the

first monastery was built. Muni-tsanpo came to the throne in 789. In order to better the condition of the poor he compelled the rich to share their wealth with the indigent. This leveling process was unsuccessful. Lang-dharma, who died in 899, left only minor sons; the kingdom was broken up into two, later into a number of petty principalities, and it was easy for Genghis Khan to incorporate Tibet into his empire in 1206.

Kublai Khan, the conqueror of China, actively promoted the spread of Buddhism throughout the Mongol Empire. Buddhism having entered from India and China in the first half of the seventh century, the language was reduced to writing, the translation of the sacred books was begun, and about 650 the first temple—the Labrang, at Lhasa—was erected. From this time forth the internal history of Tibet is the history of the struggle of Buddhism (already corrupt) with the indigenous Shamanism (q.v.), the rise and development of Lamaism (q.v.) and the Lamaistic hierarchy, the abolition of the kingly dignity and the establishment of the supremacy of the Grand Lama at Lhasa as the head of both church and state. In 1270 he made the chief of the Sakya sect head of the church, and conferred on him the temporal power. Near the end of the fourteenth century arose Tsong-k'a-pa (q.v.), the great reformer, through whose efforts Lamaism was purified somewhat, and a new and powerful sect, the Gelugpa, was founded. In 1642 Kushri Khan, the Mongol Prince of Kuku Nor, conquered Tibet, and in 1645 made over the sovereignty of it to the Grand Lama of the time, with the title of Dalai (or Talé) Lama. He has continued ever since to be both the head of the state and the head of the church, the Chinese Empire having confirmed him in both offices in 1650. In 1717 the Sungars invaded the country, but were driven out by Chinese armies in 1720, when eastern Tibet was placed under the direct rule of Chinese officials at Kansu and Szechwan. In 1774 Warren Hastings sent from India an envoy to negotiate friendly commercial relations between Tibet and the British East India Company. Another embassy was sent under Turner in 1783, but his efforts were made futile by the policy of the company under the administration of Lord Cornwallis, who, under treaty engagements with Nepal, assisted the Gurkhas when in 1790 they invaded Tibet and plundered Tashilunpo. They were driven out in 1792 and the passes between India and Tibet remained virtually closed until 1903.

The latter years of the Manchu dynasty saw a steady decline in Chinese control over Tibet. The inability of the Peking government to establish order and security finally led to the sending of a mission with an escort (the Young-husband expedition) by the Indian government to Lhasa in 1904, in order to arrange matters directly with the Tibetan authorities. (See above.) These direct negotiations between India and Tibet led to a protest from the Chinese government, who demanded recognition as the suzerain of Tibet. The lengthy negotiations which followed resulted in the Anglo-Chinese convention of 1906, supplemented by a trade agreement in 1908. China, as the recognized sovereign power in Tibet, paid to the British an indemnity of 2,500,000 rupees, and Great Britain began to evacuate the Chumbi valley in February, 1908.

Great Britain next made a convention with Russia, Aug. 31, 1907, in which both high contracting parties agreed not to enter into negotiations with Tibet except through the Chinese government; nor was either power to send representatives to Lhasa.

The Chinese retained their hold on Tibet until the revolution of 1911. When it broke out the Chinese garrison at Lhasa mutinied in sympathy, but their lawless excesses against the inhabitants led to a revolt. They were besieged in Lhasa until August, 1912, when they were forced to retire, minus arms and ammunition, from Tibet by way of India. An expedition was immediately organized in China for the purpose of reconquering Tibet, and it would have been successful had not Great Britain protested that such expedition was a violation of the Anglo-Chinese treaty of 1906. China claimed the right to send troops into Tibet to restore order and to pacify the borderland, also to police and administer the country according to her suzerain rights. She disclaimed all intention to convert Tibet into a Chinese province. Great Britain, however, prevented the sending of the expedition and the consequent subjugation of the country by the Chinese.

By 1913 all Chinese troops had been driven out of Tibet, and the Tibetans claimed independence. An agreement to that effect was made, Jan. 11, 1913, with Mongolia. The Dalai Lama, as Sovereign of Tibet, approved of the formation of an independent state in Mongolia (Outer), which had also revolted from Chinese authority, while the Sovereign of Mongolia (the Hutukhta of Urga) likewise approved of Tibet as an independent state. Buddhism was to be established on a firm footing, and mutual assistance and protection (against China) was promised by one new state to the other.

An attempt to end the anomalous situation in Tibet and to establish its status was made by the Simla Conference, which met in October, 1913, with representatives from China, the Indian government, and the Dalai Lama. The conference resulted, April 27, 1914, in a provisional agreement of 11 articles and a later exchange of notes of seven articles. The following provisions were adopted: (1) For administrative purposes Tibet was to be divided into Outer and Inner Tibet, Inner Tibet being the region adjacent to China. (2) Tibet was to form part of Chinese territory, under Chinese suzerainty. (3) Outer Tibet was to be autonomous. Great Britain and China were to abstain from all interference with its administration. China was to agree that Outer Tibet would not be represented in any future Chinese parliament, and was not to send troops into the country, or establish any Chinese colonies or civil or military officers in that region. (4) A Chinese official was to be maintained at Lhasa, with an escort of 300 men. (5) The British agent at Gyantse might visit Lhasa with an escort. (6) The trade regulations of 1893 and 1908 were to be cancelled. (7) Difficulties between the Chinese and Tibetan (Outer) governments arising out of this agreement were to be referred to Great Britain for adjudication.

The Chinese government at Peking repudiated the acts of its representative and refused to sign, although Great Britain and Tibet signed on July 3, 1914. China based her refusal on the fact that Chiamdo was included in Outer instead of Inner Tibet, and that Litang and Batang in

Inner Tibet were in reality parts of Szechwan Province. Great Britain notified the Chinese government that, until the convention was signed, China would be deprived of all the rights and benefits accruing to her therefrom.

TIBET, LITTLE. See **BALTI**STAN.

TIBIA (Lat., shin bone). In anatomy, the larger of the two bones forming the leg, the other being the fibula. It articulates with the femur above and with the astragalus below.

The tibia was also the name of the commonest musical instrument of the Greeks and Romans. It was a pipe or flute, originally made of bone, but later of a reed, with the opening at the top, protected by a natural knot, with a tongue beneath, partially detached by a longitudinal slit. It was used at festivals, sacrifices, and dances, as an accompaniment to

the rowing of the trireme, sometimes also to the march of troops to battle. The *tibia dextra* was the bass instrument and was held in the right hand, the *tibia sinistra*, or treble instrument, in the left. The *tibiæ pares* were both treble or both bass, and the *tibiæ impares* were one bass and one treble.

TIBULLUS, ALBIUS (c.54–c.19 B.C.). A Roman elegiac poet, born of a noble family. He inherited an estate at Pedum, between Tibur and Præneste, which had been either wholly or partially confiscated in the civil wars. Tibullus, however, recovered part of his property, and spent there the best part of his life. He was patronized by Messala, whom in 31 he accompanied to Aquitania, to help suppress a serious revolt. He was present at the battle of Atax, a final blow to the insurgents; and he celebrates in a fine strain of poetry his honorable part in the campaign. Next year Messala was sent to the East, and again Tibullus accompanied him; but, having been obliged from illness to stop at Corcyra, he returned to Rome. Henceforth he devoted himself to poetry. His *Elegies* (four books) are mainly addressed to his mistresses, Delia, Nemesis, and Glycera. The third book is now believed to be the work, not of Tibullus, but of an inferior poet; while the hexameter poem on Messala (opening the fourth book) is also supposed to be by another. The character of Tibullus was pure, amiable, and winning. During life he had the honor of being addressed in an ode and an epistle by Horace; after death, of being bewailed in an elegy of matchless beauty by Ovid. The best editions are those of Bachrens (Leipzig, 1878), Hiller (ib., 1885), Müller (ib., 1885), Postgate (1906), and, with admirable Introduction and Commentary, by K. F. Smith (New York, 1913). The poems were translated into English by Grainger (1752) and Cranstoun (1872), into English prose by Kelly (1854), and into English verse by T. C. Williams (1905). Consult: W. Y. Sellar, *Horace and the Elegiac Poets* (Oxford, 1892); J. W. Duff, *A Literary History of Rome* (New York, 1909); W. S. Teuffel, *Geschichte der römischen Litteratur*, vol. ii (6th ed., Leipzig, 1910); Martin Schanz, *Geschichte der römischen Litteratur*, vol. ii, part i (3d ed., Munich, 1911).

TIBUR. See TIVOLI.

TIBUS. See TIBBUS.

TICAO, tē-kā'ō. An island belonging to the Philippine Province of Masbate (q.v.).

TIC DOULOUREUX, tik dōō'loo'rōō', *Fr.* pron. -rē. See FACIAL NEURALGIA.

TICHBORNE TRIAL. A celebrated trial in which an impostor attempted to obtain possession of the Tichborne estates in Hampshire and Dorsetshire, England, by assuming to be the heir, Roger Charles Tichborne. The case was remarkable for the interest it aroused, for the thoroughness of the trial, and for the impostor's success in deceiving many people. The real Roger Charles Tichborne was born in 1829, and after some education in France, and at the Roman Catholic College at Stonyhurst, England, entered the British army. His accent and eccentricities made him unpopular and he resigned and went to Brazil. In 1854 he sailed from Rio de Janeiro in the ship *Bella*, which was lost at sea with all on board. His father, Sir James Tichborne, died in 1862, and as Roger was supposed to be dead, a younger son, Alfred, became heir. Lady Tichborne refused to believe

that her son Roger was dead, and advertised extensively for information regarding his whereabouts. In 1865 a butcher, Arthur Orton, who resided at Wagga Wagga, in New South Wales, under the name of Thomas Castro, conceived the idea of representing himself to be Roger Charles Tichborne and claiming the estates. He wrote a letter to Lady Tichborne claiming to be her son. The letter was illiterate and contained statements as to his identification which were wholly false and inapplicable to the true heir. He subsequently came to England, went over the Tichborne estates, gained all the information he could as to the former life and habits of Roger, and succeeded in convincing the family solicitor and others of his identity. In January, 1866, he called on Lady Tichborne in Paris and was received as her son. This was remarkable, as there was no similarity in the appearance of Orton and Roger Tichborne, and Orton had no knowledge of the French language, in which the true heir was proficient. After this recognition he had great success in gaining adherents, but the Tichborne family repudiated him, and investigated his life, discovering his true name and past career. He succeeded in raising large sums of money by issuing bonds, payable upon his obtaining possession of the property. These were widely distributed. He brought ejectment suits to recover the estates in 1871, and succeeded in inducing over 100 witnesses to swear that they recognized him or believed him to be Roger Tichborne. Despite his ignorance, he exhibited remarkable shrewdness and cunning at the trial, which lasted 103 days and ended in his being nonsuited. In 1873 he was tried for perjury, being defended by Edward Kenealy, and after a trial of 188 days was convicted, and sentenced to 14 years' penal servitude. He was released in 1884, and unsuccessfully attempted to stir up public sentiment in his favor. The cost of the two trials has been estimated at £200,000. Orton died in abject poverty in 1898. Consult *The Tichborne Romance* (Manchester, England, 1871) and *Charge of Lord Chief Justice of England in the Case of Queen vs. Thomas Castro* (London, 1874).

TICINO, tē-ch'no. A river of Switzerland and north Italy (Map: Switzerland, C 3). It rises on the south slope of the St. Gotthard, flows in a general southerly course through Lago Maggiore, and empties into the Po after passing the city of Pavia. Its length is 154 miles. Its upper course is a wild mountain torrent flowing through romantic gorges, but below the lake it is navigable and communicates with several canals.

TICINO (Ger. *Tessin*). A southern canton of Switzerland, bordering on Italy. Area, 1088 square miles (Map: Switzerland, C 2). It has a very mountainous surface intersected by the valleys of the Ticino, Maggia, Moesa, and of a few other streams. In the north rise the Lepontine Alps with the St. Gotthard, in the east are the Adula Alps, while the south around Lago Maggiore is comparatively low, and is the most fertile part of the canton. Notwithstanding its mountainous character, Ticino has two-thirds of its area under cultivation. Cereals are the chief products, but southern fruits and grapes are also cultivated on a large scale. The manufacturing industries are undeveloped and native artisans emigrate annually to other parts of Europe. The chief means of transpor-

tation is the St. Gotthard Railway. The constitution (as amended in 1892 and 1904) provides for a Legislative Assembly elected by the people on the basis of proportional representation, and an Executive Council, also elected by the people. The optional referendum prevails. Pop., 1900, 138,638; 1910, 158,556, almost exclusively Italians. Capital, Bellinzona (q.v.).

Ticino as part of Gallia Cisalpina was early joined to the Roman Republic. After the decline of the Roman power it passed successively into the hands of the Ostrogoths, Lombards, and Franks. During the later mediæval period its territory formed a portion of the Duchy of Milan, from which it was wrested in successive conquests during the fifteenth and sixteenth centuries by the members of the Swiss Confederacy, whose title was confirmed by the Eternal Peace of 1516. The attempt to establish Protestantism in the District of Locarno was rigorously stamped out by the exile of members of that faith in 1555. The rule of the Italian district by the other members of the confederacy was harsh, but only one rebellion, in 1755, marked its course. In 1798 this district, divided into the cantons of Bellinzona and Lugano, was constituted part of the Helvetic Republic; in 1803 they were united into one canton—Ticino—which received greater privileges as a full member of the confederacy. Other difficulties were removed by the constitution of 1830, but measures of a religious and commercial nature have often separated the inhabitants from the sympathy of their northern neighbors, and local struggles of Radical and Ultramontane parties have often necessitated Federal interference. Consult Motta, *Bibliografia storica ticinese* (Zurich, 1887); Samuel Butler, *Alps and Sanctuaries of Piedmont and the Canton Ticino* (New York, 1913).

TICINUM. See PAVIA (second paragraph).

TICK (AS. *ticia*, miswritten for *tiica*, *tica*, Ger. *Zecke*, tick; connected with Armen. *tiz*, tick). One of those members of the order Acarina which belong to the families Argasidæ and Ixodidæ, which have been grouped together in the superfamily Ixodoidea. The ticks or louse flies are eight-legged creatures in which the cephalothorax is coalesced with the abdomen. The newly hatched individual is flat and nearly circular and has only six legs. With the first molt it enters the second or nymphal stage, which is characterized by the presence of a fourth pair of legs. After the second molt it becomes mature. In the free-living state the body of a mature tick is flattened dorsally and is of an oval shape. The body is covered with a leathery integument which generally assumes on the dorsal surface a hardened, chitinous, more or less smooth, and darker appearance. Near the margin it is impressed by a depressed line leaving a distinct rim around the body.

All ticks, so far as known, although found upon plants in their early stages, are parasites of animals. The young seek on every possible occasion to fasten themselves to vertebrate animals, usually mammals and birds, choosing spots where the skin is soft. When the young first fasten themselves they cannot penetrate deeply enough to draw blood, but the irritation causes a suppuration on which they feed. When they have grown sufficiently to enable them to reach a blood vessel, the small, flat, semitransparent creatures soon become distended, the body becomes rounded, and the color frequently becomes

dark red. In a week or more the larva is transformed into the nymph, which at the expiration of another week is changed to a mature individual. Only the female sucks blood, so far as is known. The male retains its form and size, and although it attaches itself to warm-blooded animals, it evidently does so only to seek the female.

Several species occur in the United States. The common dog tick or wood tick (*Dermacentor electus*) is found frequently in the woods in the Northern States. The common tick occurring upon the ground squirrel in the Mississippi valley is *Ixodes ricinus*. *Argas miniatus* is destructive to chickens in parts of Texas and Florida, and *Argas reflexus*, the pigeon tick, is common in pigeon houses in Europe and the southern United States. This species is capable of living a great length of time without food. In Persia a species, the miana bug (*Argas persicus*), lives in houses and seeks human prey at night; its bite causes serious disturbance, and is said even to cause death. In South America a species known as garapate (*Amblyomma americanum*) occurs in dry, bushy places, where it clings to twigs and transfers itself to passing horses or cattle. It also lives in the United States and has been found on human beings. Eight species of ticks in the United States have been found upon cattle, one associated with the Texas cattle fever (*Boophilus annulatus*) being the most noted and most destructive. Other species of the same genus transmit the same or similar diseases of cattle in other parts of the world. *Boophilus australis* transmits what is probably the same disease in Australia, and *Boophilus decoloratus* (the so-called blue tick) acts the same way in South Africa, carrying the disease commonly known as red water. Texas cattle fever is particularly destructive to northern cattle that have been shipped south or that have been brought into contact with southern infested cattle shipped north. The dipping of cattle in vats containing cottonseed oil or any one of several mixtures, known as cattle dips, destroys the ticks.

Certain mites of the family Gamasidæ are sometimes known as ticks, although the name in this application is erroneous. The bird tick (*Dermanyssus avium*) is a familiar parasite of caged birds. The poultry tick (*Dermanyssus gallinæ*), also known as the little chicken mite, clings to fowls and sucks their blood. Certain of the true insects are also erroneously called ticks. For example, the flies of the family Hippoboscidæ are quite generally known as bird ticks. (See FOREST FLY; PUPIPARA.) The degraded wingless flies of the family Nycteribiidæ are called bat ticks.

Consult G. H. F. Nuttall and others, *Ticks: A Monograph of the Ixodoidea* (2 vols., New York, 1908-11), containing a bibliography, and W. A. Hooker and others, *Life History and Bionomics of some North American Ticks* (Washington, 1912). See also DOVE TICK; LOUSE FLY.

TICK'ELL, THOMAS (1686-1740). An English poet, born at Bridekirk, in Cumberland. He was educated at Queen's College, Oxford, of which he became fellow (1710-26). He attracted the attention of Addison by some lines praising the latter's *Rosamond*; and Addison, on becoming Secretary of State in 1717, made him Undersecretary. He was secretary to the

Lords Justices of Ireland from 1724 till his death. He published *Prospect of Peace* (1712), *The Royal Progress* (1714), and a poetical version of the first book of the *Iliad* (1715), out of which grew the famous quarrel between Pope (q.v.) and Addison (q.v.). His best-known poem is *Colin and Lucy*; the longest is *Kensington Gardens* (1722). Goldsmith calls his *Elegy on Addison* (prefixed to Addison's *Works*, 1721) one of the finest odes in our language. Consult Samuel Johnson, *Lives of the British Poets*, vol. ii (ed. by G. B. Hill, Oxford, 1905).

TICKER. See TELEGRAPH.

TICKET (OF. *estiquette*, *etiquette*, Fr. *étiquette*, ticket, label, *etiquette*, from OHG. *stehan*, Ger. *stechen*, to stick). A slip of paper containing a statement or certificate that the person to whom it is issued, or the holder, is entitled to some right or privilege therein referred to or described, as railroad tickets, theatre tickets, pawn tickets, and lottery tickets. A ticket is evidence of a contract between the holder of the ticket and the person or corporation issuing it. Usually tickets do not purport to express the entire contract between the parties, and the terms or conditions which are not expressed may be supplied by parol evidence (q.v.). Where the ticket grants the right or privilege of using the grantor's real estate, as in case of theatre tickets, the holder of the ticket acquires no title or interest in the real estate, but becomes a mere licensee (see LICENSE) entitled to use the real estate in the manner and for the purposes specified. The licensor or grantor of the ticket, however, may at will revoke the license, even though such a revocation is a breach of the contract; and upon such revocation the holder of the ticket becomes a mere trespasser and may be summarily ejected, but only necessary force can lawfully be used for that purpose. He may, however, be entitled to recover damages for breach of the contract in ejecting him. This right of the theatre proprietor, however, is not an absolute one, to be exercised under all circumstances, and if the discrimination against a patron is for reasons of race, creed, or color a severe penalty will be imposed for each ejection or revocation of license. Furthermore, a license, evidenced by a ticket, may become irrevocable when coupled with an interest, as in cases where the licensee has an interest in the property or enterprise which is involved in the transaction. The courts of New York have held that an adverse critic may be excluded, inasmuch as his exclusion is not on the ground of discrimination for reasons of race, creed, or color. See THEATRE.

This rule does not apply in the case of tickets issued by common carriers, who, by virtue of their public calling, are compelled to accept for carriage all who pay a reasonable fare and comply with their reasonable rules and regulations. Passenger tickets under ordinary circumstances are generally now held to be contracts, and not mere symbols or means of identification of the passenger, so that the holder of a ticket is deemed to assent to its terms. Such stipulations, which usually restrict the liability of the carrier, have been held to be valid and binding if reasonable and not against public policy. Common carriers may require passengers to buy tickets as a condition of their being carried; and, when reasonable

opportunity to do so is given, the carrier may charge an additional rate when the passenger has failed to buy a ticket. Common carriers may make any condition as to the time and use of tickets which is reasonable. Thus provisions contained in the ticket that it shall be used before a date named, or that it shall be stamped by the carrier before it is presented for a return trip, or that it shall not be transferable, have been held to be valid.

The carrier may require the passenger to produce the ticket or an identification check for inspection whenever requested to do so, and upon the passenger's failure to comply with the regulation may eject him. This appears to be the general rule even when the passenger's inability to comply with the regulation is due to the neglect of the carrier's agents, as when the wrong ticket is given out by the carrier's ticket agent or the wrong coupon is taken up by one conductor, so that the passenger is left without the proper coupon at a subsequent stage of his journey. The passenger's right in such a case is not to insist upon being carried without payment of the fare demanded by the conductor or other agent of the carrier, but to pay the fare demanded and to bring an action against the carrier for breach of the contract evidenced by the ticket. Purchase of a ticket entitles the holder to all the accommodations usually given by the carrier to holders of that class of tickets. If, however, they are not provided, as in case the carrier fails without excuse to provide the passenger with a seat, his right is not to refuse to pay fare or surrender his ticket, but to recover damages for the carrier's breach of contract or undertaking to carry. Where the passenger is riding on a free pass the duty of the carrier towards him is the same as that owing to a trespasser, viz., to refrain from wanton or willful injury. See CARRIER, COMMON; TRANSPORTATION; ETC.

TICKET OF LEAVE. In Great Britain and its Australian colonies, a kind of permit or license granting a prisoner his liberty for good conduct, and revocable for subsequent misconduct, under the terms of its conditions. The term was first applied to the license of liberty granted to convicts in Van Diemen's Land as a part of the reform in prison methods in 1840, and later to those who were granted a similar license in England as a partial compensation for their long term of imprisonment after transportation had been discontinued, but the terms of sentence had not been shortened. These convicts became so numerous, and the number of crimes committed by them became so serious, that a still further reform led to the system of granting the license upon the mark system, under which it was given only to convicts sentenced for terms longer than two years, who by their work and industry, as shown by their marks, became entitled to it. Under this system the ticket of leave has been found to work well, its chief defect being the drawback put upon the prisoner's chance of success in obtaining work and living among reputable people by his liability to constant surveillance by the police officials. This defect is largely removed by the existence of various private charitable institutions which look after the prisoners who place themselves under their charge in such a manner as to remove the publicity of their being watched. The prisoner is practically free to come and go as he chooses within a certain

district, under certain conditions of living an honest, industrious life among honest people, and making periodical reports.

The effectiveness of such a system of rewarding good conduct on the part of prisoners, and inducing them to live honest lives without imprisonment, but yet where their conduct is subject to control, has become so generally recognized that similar acts have been passed in many of the United States, the license being generally called a parole. Most of these acts have been passed since 1890, and under none of them can a parole be granted to a person convicted of murder in either the first or second degree; and most of them refuse it to a prisoner serving under a second conviction of crime.

Consult PENOLOGY, and works referred to there: PRISONS.

TICK FEVER. See SPOTTED FEVER.

TICKLING. See CUTANEOUS SENSATIONS; LAUGHTER.

TICK'NOR, FRANCIS ORREBY (1822-74). An American poet, born in Baldwin Co., Ga. He studied medicine in the North and practiced his profession at Columbus, Ga. A small volume of miscellaneous verses—*Poems*, with a memoir, by Paul H. Hayne—was published in 1879. Two poems of Ticknor's are well known and rank among the best lyrics produced in the South. They are the pathetic "Little Giffen" and the stirring "Virginians of the Valley." His *Poems*, edited and collected by M. C. Ticknor, appeared in New York in 1911.

TICKNOR, GEORGE (1791-1871). An American literary critic and historian, born in Boston. Educated in a scholarly home, a graduate of Dartmouth (1807), admitted to the Boston bar in 1813, he gave up the legal profession for literature, went to Europe in 1815, studied four years at Göttingen and in other continental cities, and returned in 1819 with a valuable library to a professorship of modern languages and literature in Harvard College. Here he devoted himself especially to French and Spanish, attracting many beyond the university circle. He resigned his professorship in 1835, passed three years in Europe and 11 more years in elaborating his greatest work, *History of Spanish Literature* (1849), which was translated into German and Spanish and came to be regarded as a standard work even in Spain. It was reissued in 1854, and again reedited and enlarged in 1863. A fourth edition embodies his latest revisions. He published also a *Life of William Hickling Prescott* (1864) and several minor works. His *Life, Letters, and Journals* are collected in two volumes (1876). Other letters describing his life as a German student may be found in W. P. Trent's *English Culture in Virginia* (Johns Hopkins University Studies). His library, containing one of the best collections of Spanish literature in existence, was bequeathed to the Boston Public Library. As an educator Ticknor was in advance of his generation; as a citizen he represented the best traditions of Boston; as a scholar he held his own with the erudite men of his day, but his greatest work is now losing its prestige.

TICKNOR, WILLIAM DAVIS (1810-64). An American publisher, born at Lebanon, N. H. He helped to found at Boston in 1832 the publishing firm of Allen and Ticknor, succeeding to the business of Carter and Hendee. His partner retiring the next year, Ticknor carried on the business alone for some six or seven years, and

then John Reed and James T. Fields (q.v.) the latter formerly in the employ of Carter and Hendee, joined him. For about 10 years after 1854, when Reed withdrew, the firm name read Ticknor and Fields. Ticknor and Fields became the publishers of the *Atlantic Monthly* and the *North American Review*. Their office, in the "Old Corner Book Store" building (still standing in 1916), was a gathering place for the leading literary men of the time. They were among the first American publishers to make payments for editions of English and other foreign authors, beginning with £100 to Tennyson in 1842.

TICON'DERO'GA. A village in Essex Co., N. Y., 100 miles north by east of Albany, on the creek which conveys the waters of Lake George into Lake Champlain, and on the Delaware and Hudson and the Rutland railroads (Map: New York, G 3). It is rich in reminiscences of Colonial and Revolutionary periods. The vicinity is noted for its extensive production of crystalline graphite, furnishing the greater part of the total output of the United States. The water power afforded by the falls is utilized by several industrial establishments. Paper, wood pulp, and lumber products constitute the leading manufactures. Pop., 1900, 1911, 1910, 2475; 1915 (State census), 2918.

In 1755 the French, recognizing the strategic value of the promontory, built a fort here and called it Fort Carillon (chime of bells), in allusion to the pleasing sound of the waterfalls near by. Several years later the present name was adopted. In 1757 Montcalm assembled here a force of 9000 men, with which he took Fort William Henry, on Lake George. On July 8, 1758, General Abercromby, with 15,000 men, stormed Fort Carillon, but was repulsed with a loss of 2000, Viscount George A. Howe being among the killed. In 1759 General Amherst with a force of 12,000 men invested it, and the French being too weak to withstand an attack, dismantled and abandoned both this fort and Crown Point, which were then enlarged and strengthened by the English. Being weakly garrisoned after the cession of Canada to Great Britain, Ticonderoga was surprised and captured on May 10, 1775, by Ethan Allen. On June 30, 1777, Burgoyne invested it, and on July 5, by placing a battery on Mount Defiance, a higher point, then called Sugar Loaf Hill he forced the garrison to evacuate the place. Later in the year General Lincoln attacked the British here and captured Mount Defiance, releasing 100 American prisoners and taking 29 of the English, but he failed to recover the fort itself. After Burgoyne surrendered at Saratoga, the English garrison was removed and the fort dismantled, though in 1780 another English force under General Haldimand was stationed here. The fort has gradually fallen in ruins. Consult W. C. Watson, *Military and Civil History of the County of Essex, New York* (Albany, 1869), and L. E. Chittenden, "The Capture of Ticonderoga," in *Vermont Historical Society, Proceedings* (Montpelier, 1872).

TIC-POLONGA. See DABOIA and Colores Plate under SNAKE.

TICUNA, tã-kō'ná, or TUCUNA. A wild tribe of uncertain affinity inhabiting the forest of the Upper Amazon (Marañon) about the confluence of the Javary, on the Brazil-Peru frontier. They go naked, excepting for necklaces of monkey teeth and armlets of feathers, and depend for a living upon hunting and fishing

Physically they are well formed, and rather slender, with dark complexion and mild expression. In disposition they are honest and direct. They bury their dead in great earthen jars, with their face turned towards the rising sun, and weapons and fruit placed upon the bosom. They have interesting masked dances and an operation allied to circumcision is practiced on infants at the time of assigning them names. Jesuit missions were established between 1683 and 1727. Consult K. F. P. von Martius, *Ethnographie und Sprachenkunde Brasiliens*, vol. i (Erlangen, 1863), and A. F. Chamberlain in *Journal de la Société des Américanistes de Paris*, new series, vol. vii (Paris, 1910).

TIDAL (Heb. *Tid'al*). A king of Goiim, who, according to Gen. xiv. i, accompanied Chedorlaomer of Elam, Amraphel of Shinar, and Arioch of Ellasar in an expedition against Palestine. Goiim is supposed by many scholars to be a clerical error for Gutim. Tidal would then be a ruler of Gutium (see *ARRAPACHITIS*; *AR-PACHSHAD*), like Amraphel subject to the suzerainty of Elam. Amraphel is, no doubt, identical with Hammurapi (2141-2081 B.C.), and the passage referring to Tidal in Gen. xiv may have been drawn from a cuneiform account. The name *Tudhul*, which may have been rendered *Tid'al*, occurs in a late cuneiform inscription, as the son of Gannazi; but the mutilated text does not permit any definite conclusion. See *CHEDORLAOMER*.

TIDAL WAVE. A term erroneously applied to almost any unexpected wave that inundates the seacoast or the shore of a great lake. These waves are rarely, if ever, due to the tides, since the tidal wave is a phenomenon admitting of exact calculation and prediction; on the other hand, they may usually be traced to some distant earthquake or violent storm. The Messina earthquake of 1908 which had its origin in the narrow strait between Sicily and the Italian coast set up sea waves which reached a height of 35 or 40 feet and were responsible for much damage. The Galveston floods of 1900 and 1915 were caused by the piling up of the waters driven in by West Indian hurricanes. See *EARTHQUAKE*; *INUNDATION*.

TIDE (AS. *tid*, OHG. *zit*, Ger. *Zeit*, time; connected with Skt. *a-diti*, boundless, and ultimately with Eng. *time*). The daily rising and falling of the waters of the ocean. When the water has reached the highest point it is called high water, and at its lowest point low water. The rising of the water is called flood, the falling ebb. Tides are caused by the gravitational attraction or pull of the sun and moon upon the water, and upon the earth itself. The moon, being so much nearer than the sun, is of course the principal cause. When the moon is directly over a given place it pulls the water under it, and thus tends to heap up a tidal wave just under the moon. At the same time it is pulling the earth itself; but it pulls the water more than the earth underneath, simply because the moon is nearer to the water on the surface than it is to the solid earth behind it. For we must remember that, according to Newton's law of attraction, the pull decreases rapidly when the body pulled is removed to a greater distance. But this reason also makes the attraction exerted upon the solid earth greater than that affecting the mass of water upon the side of the earth remote from the moon. This water, being still

farther away than is the solid earth, gets the least pull of all. The earth is, so to speak, pulled away from that part of the ocean. This causes another distinct heaping up of water on the farther side of the earth giving us a second tidal wave. There should be, therefore, two lunar tidal-wave crests, one directly under the moon and the other on the side of the earth diametrically opposite. At these points it will be high water, while along the circle of the earth distant 90° from the sublunar point it will be low water. In the same way, the sun gives rise to two tidal-wave crests which, however, are not so pronounced as those due to the moon, since, on account of the greater distance of the former body and notwithstanding its enormously greater mass, its tide-raising force is only about $\frac{1}{4}$ of that of the moon. The actual tide, then, will be that due to the added effects of the solar and lunar tide-raising forces, which result in a tidal wave with two crests that are at times a little in advance, at others a little behind, the positions of the crests due to the moon alone, depending on the relative positions of the sun and moon. The double tidal wave explains why there are two high tides and two low tides every 24 hours; actually the average period is 24 hours 51 minutes, since, owing to the eastward motion of the moon, it comes to the meridian later each day, the average daily retardation being 51 minutes. At new and full moon, the earth, sun, and moon are in a direct line with one another, and consequently the crests of the solar and lunar tidal waves will then coincide, and we shall have high water higher, and low water lower, than the average; these are the spring tides. On the other hand, at first and third quarters, the moon is at right angles to the sun as seen from the earth, and the crests of the lunar tide coincide with the troughs of the solar tide, with the result that high water is lower, and low water higher, than the average; these are the neap tides. The heights of spring and neap tides are very nearly in the ratio of 13 to 5. Both tides are most marked about January when the sun is nearest the earth and therefore its tide-raising force is greatest whether acting with or against that of the moon. Between new moon and first quarter, and also between full moon and last quarter, the crest of the solar tide is in advance of that of the lunar tide, and consequently high water occurs a little before the time at which it would be due were the moon the only tide-raising body concerned; and the tides are then said to prime. On the other hand, between first quarter and full moon, and between last quarter and new moon, high water is later in arriving, and the tides are said to lag. The foregoing explanation is called the equilibrium theory of the tides. It is very plausible, but unfortunately it fails to agree with observed facts, though it is nevertheless of great use in leading up to a better theory. Under the equilibrium theory we should expect high water at any place about the time when the moon, as astronomers say, passes the meridian. This time might be modified by the solar effects, as we have seen, but only to a trifling amount which can be easily calculated. Unfortunately, this theory is not in accord with observation. There are places where the high water comes as much as six hours away from the meridian passage of the moon. In other words, the equilibrium theory is at times in

error by the maximum possible amount. The trouble is that it tells us what would happen if the forces governing the tides had plenty of time to act. But the turning of the earth on its axis continually presents a new meridian to the moon, so that the tidal-wave crest is always following the moon, ever trying to be highest directly under it. Thus what should occur under the equilibrium theory is greatly modified by the theory of the motion of fluid waves. This leads then to the dynamical theory of the tides.

A consideration of the subject is much simplified by assuming a condition of things that does not really exist in nature. Let us imagine a canal full of water encircling the earth at the equator. Sir Isaac Newton was the first to investigate what would happen to a wave set in motion in such a canal. It can be shown mathematically that the speed at which such a wave would travel depends simply on the depth of the canal. The deeper the canal, the greater the speed of the wave. This is, of course, very important, and shows what a perfectly free wave would do under such simplified conditions. It can even be computed that if the canal were $13\frac{3}{4}$ miles deep, the wave would travel round the earth in exactly twenty-four hours. Now, it is the tendency of the sun and moon to set such a free wave in motion at each instant of time; and these go on traveling along more or less like the supposed simple wave in the canal. If the ocean were $13\frac{3}{4}$ miles deep, the waves would have a period of one day; and the new free waves forming all the time would reinforce the old ones, leading to an enormous tidal accumulation. Fortunately, the ocean is much less than $13\frac{3}{4}$ miles deep, and the waves travel much more slowly than once a day. It may happen, therefore, that as the waves travel around the earth, their speed may be such that we shall find a wave hollow instead of a wave crest under the moon. Thus, the modification of the equilibrium theory by the wave motion may at times completely reverse things, giving us low tide when we should expect high tide.

We may carry the canal idea a step further, with a remarkably interesting result. Suppose the whole surface of the earth were covered with a series of canals parallel to the equatorial canal. Then, as we approach the pole, the canals will be shorter, since the equatorial circumference of the earth is longer than it is in any other latitude. Thus the waves in high latitudes would not have so far to go as the waves in the low latitudes, and so might tend to reinforce each other as explained above. So we might have inverted tides in the equatorial regions and direct ones in the polar regions; and in some intermediate latitude there would be, as Darwin says, "very great tides, the nature of which cannot be specified exactly." This would occur, as we have seen, where the earth's circumference is short enough to permit a free wave to go all around in about 24 hours. These dynamical considerations of wave motion in canals lead to results bearing some sort of resemblance to the actual observed phenomena of nature. It should be noted, of course, that the foregoing considerations refer to theoretical conditions such as would exist if the earth were simply covered with a layer of water. But the actual facts of nature are so different that they modify very greatly the theoretical

tidal action of the sun and moon. So large a part of the terrestrial surface is covered by land that the free motion of tidal waves is seriously impeded. It is therefore impossible to predict the times of high water accurately from theoretical considerations alone. Fortunately, the practical prediction of the time of high water for any place can be effected by analyzing a long series of tidal observations made at the place in question. This method of procedure has been in use for many years, and we now possess tidal tables for all principal seaports accurate enough for navigation.

A modification of ordinary tides occurs in rivers. Here the tidal rise appears of course as a strong current running up-stream, where the ocean level outside the river-mouth has been raised. At times this tidal current advances with a high and dangerous wave crest (called a bore), and it may acquire velocity enough to raise the water level in the river considerably above that of the ocean outside. These phenomena, and indeed all tidal phenomena, are partly modified by the configuration of the coast line and the depth of water. (See HYDROGRAPHY.) Consult: Sir R. S. Ball, *Time and Tide* (London, 1892); G. H. Darwin, *Tides and Kindred Phenomena in the Solar System* (Boston, 1898); William Dampier, in *Voyages* (2 vols., ib., 1906); W. H. Wheeler, *Practical Manual of Tides and Waves* (ib., 1906); W. B. Dawson, *Methods of Investigation of Tides and Currents* (Ottawa, 1911); W. H. Hunter, *Rivers and Estuaries, or Streams and Tides* (New York, 1913).

TIDEMAND, tē'dā-mān, ADOLF (1814-76). A Norwegian genre painter, born at Mandal. He studied at the Academy of Copenhagen and under Hildebrandt and Schadow at Düsseldorf, whence he went to Munich and later to Rome. Afterward he usually spent the summer in Norway and the winter in Düsseldorf. Besides large historical compositions, he painted chiefly genre scenes illustrating Norwegian peasant life, which he depicted, in the manner of the Düsseldorf school, from the idyllic and romantic rather than the pictorial side. Such are: "Devotional Meeting of the Haugianers" (gold medal, 1848, Christiania and Düsseldorf galleries); a cycle of 10 pictures (1850, Château of Oscarshall, near Christiania); "Summer Evening on a Lake" (1851, National Gallery, Berlin).

TIDE WATERS. The legal term for waters subject to the ebb and flow of the tide. Formerly the term was synonymous with navigable waters. The modern development of waterways and commerce has made many nontidal waters, such as canals, lakes, and rivers, navigable, and the terms are now interchangeable. Navigable means for the ordinary modes of travel or trade. The fact that a body of water or stream is not navigable throughout, or that it is only periodically navigable, is immaterial. Nor does it mean water that is used for pleasure alone, such as shallow streams or marshes, where a row boat may be floated. The legal questions arising concern first the water, and second, the shore and land under water. Under the first heading are questions relating to navigation and fishing, and under the second, ownership of the shore, pier rights, and oystering. Because they are navigable such waters, in the same way as highways, are considered public property. In England the common law theory was that such

waters, land thereunder, and land between high and low watermark, belonged to the crown. Following that theory the separate States in the United States have ownership, but under the powers delegated to it by the Constitution the Federal government regulates foreign and interstate commerce, and exercises supervision over interstate waterways, also in regard to irrigation. (See **WATER RIGHTS**.) Before their admission as States the title to tidal waters and land within Territories is in the Federal government. The question of control over boundary waters often arises between States, both foreign and in the United States, but is usually settled by conventions. (See **TERRITORIAL WATERS**.) Navigable waters may not be obstructed in any manner which would interfere with navigation or use by the public. They may be privately owned, such as canals and small lakes, but they are subject to the supervision of the State. Any obstruction may be removed as a nuisance. Bridges may be placed over tidal or navigable waters, but they must be built in such a manner—either with draws or of sufficient height—as not to prevent ordinary transportation on the water beneath. A grant to a railroad to erect a causeway without adequate provision in this regard would be considered illegal. The right of fishing on tidal waters is a public right, on the theory that such waters belong to the State. It is usually supervised by commissions or officials.

In regard to the shore and land under water the public has no right to the use of the banks of a stream, and on the seashore no right of landing except where the shore is connected with a public highway. It has, however, the right of passage over lands between high and low watermark. The famous Cliff Walk at Newport, R. I., is an illustration of this principle—the public having the right of passage over the shore when the tide is out, the owners of the upland have found it more convenient to provide a fixed walk. Frequently grants are made by the State to municipalities, as in the case of New York City, and at times to individuals. By early statute in Maine, Massachusetts, New Hampshire, and Virginia, title to land between high and low water was granted to the owners of the upland, and in all States such grants must be authorized by special statute. In isolated instances rights have been acquired by use and prescription.

The ownership and use of the banks of a stream and of the shore involve questions of riparian rights (q.v.). Broadly it may be stated that while on nontidal waters the rights of the littoral owners to the centre of lake or streams are absolute, on navigable waters they are limited. The littoral owner has the right of access to the point of navigation, i.e., he may build a pier or wharf to the navigable part of the water, but he must not in any way interfere with navigation nor with his adjacent neighbor. Land under water belongs usually to the State, but title thereto may be given by special grant where the owner of the shore intends filling in, or for bulkheads or wharves. Special grants are in existence of the bottoms of bays or lakes independent of ownership of the upland, the right, e.g., of oystering on the bottom being absolute while the right of the public to navigation on the surface remains. Consult Gould, *Law of Waters* (Chicago, 1900). See **HIGH SEAS**; **MARE CLAUSUM**.

TIDORE, tē-dō'ra. A small island of the Molucca Archipelago, off the west coast of Gilolo, a few miles south of Ternate (q.v.). It is important as the seat of the Sultan of Tidore, who, under Dutch supervision, resides at Soa Sia and exercises authority over parts of New Guinea and neighboring islands. Pop., about 10,000, consisting mainly of Mohammedans. See **MOLUCCAS**.

TIE. In music, an arch drawn over two notes on the same degree, uniting them so that they are played or sung as one single note of the same value. See **SYNCOPE**.

TIECK, tēk, CHRISTIAN FRIEDRICH (1776–1851). A German sculptor. He was born in Berlin and studied there under Schadow, and later under David d'Angers in Paris. In 1801–05 he was employed at Weimar, where he was associated with Goethe, and modeled his bust. After a sojourn in Italy, Switzerland, and Munich, where he made numerous busts, including those of Prince Ludwig of Bavaria, Schelling, Humboldt, and his brother, Ludwig Tieck, he returned in 1819 to Berlin, and in 1820 was made professor at the academy. His chief works in Berlin are a mythological relief for the Royal Theatre, the bronze group of "Horse Tamers" on the roof of the Berlin Museum, and a statue of Schinkel in the corridor. Tieck's style remained thoroughly classical, unaffected by the naturalism of his contemporary Rauch.

TIECK, LUDWIG (1773–1853). A German romantic novelist, translator, and critic, brother of the preceding, born in Berlin. After studies at Halle, Göttingen, and Erlangen and four years of literary work in Berlin, Tieck went to Jena in 1799 and joined the Schlegels and Novalis in their romantic agitation. Leaving Jena, he went to Dresden, moved to Zübingen near Frankfort on the Oder, visited Italy (1805), England and France (1817), and in 1825 became director of the Dresden Court Theatre after having since 1819 been the centre of a literary circle there. Royal favor brought him in 1841 back to Berlin, where his dramatic talents were used in the production of several Greek plays. Tieck's significant literary career opens with *Abdallah* (1795), *Sternbalds Wanderungen* (1798), and *William Lovell* (1795–96), the last a novel of "storm and stress." His youthful imagination ran riot also in mediæval legends and fairy tales, e.g., the three volumes of *Völkermärchen* (1797), among which were versions of *Puss in Boots* and *Bluebeard*. A comedy, *The World Topsy-Turvy* (1799), *Die verkehrte Welt*, proclaimed even more emphatically his period of romantic revolt. To this year belongs also the ultraromantic work written in collaboration with Wackenroder, *Phantasien über die Kunst*, full of enthusiasm and of a mystic religiosity. His *Romantische Dichtungen* (2 vols., 1799 and 1800) were the first work to show the direct influence of association with the Schlegels. They were followed by an admirable translation of *Don Quixote* (1799–1801) and by *Kaiser Octavianus* (1804), which he published as a *Lustspiel*. This period of rapid production was succeeded by an attack of the gout. His subsequent work is less mystic, less erratic, more artistic, e.g., *Phantasia* (1812–17), but Tieck did not reach his mature style till his visit to England, the direct results of which are *Shakespeares Vorschule* (1823–29), *Dramaturgische Blätter* (1826), and the noble continuation of Schlegel's translation of Shake-

spere, of which he was the moving spirit, although his daughter, Dorothea, and Count Baudissin did the actual work. Indirectly the same influence is seen in the *Novellenkranz* (1831-35; 12 vols., 1853). Tieck's *Works* are in 28 volumes (1828-54); select works edited by Witkowski (4 vols., Leipzig, 1903) and by Bernd (2 vols., Berlin, 1908). Some tales and novels are translated by Carlyle, by Thirlwall, and others. Consult the German studies by Köpke (Leipzig, 1855) and Friesen (Vienna, 1871). Carlyle's *Essay on Tieck* was published in 1827 and introduced him to English readers.

TIEDEMANN, tē'de-mān, FRIEDRICH (1781-1861). A German anatomist and physiologist. Born and educated at Marburg, the son of the philologist Dietrich Tiedemann (1748-1803), he studied medicine at Marburg, Würzburg, and Paris, and became professor of anatomy and zoölogy at Landshut (1806) and professor of anatomy and physiology at Heidelberg (1816), resigning from the latter office in 1849. He became known as one of the leaders in his profession. Tiedemann's later years were spent at Frankfurt-on-Main and Munich. Among his many works are: *Anatomie des Fischherzens* (1809); *Anatomie der kopflosen Missgeburten* (1813); *Anatomie und Bildungsgeschichte des Gehirns* (1816); *Physiologie des Menschen* (1830-36); *Geschichte des Tabaks* (1854).

TIEDGE, tēt'ge, CHRISTOPH AUGUST (1752-1841). A German poet, born at Gardelegen, Prussian Saxony. After studying jurisprudence at Halle, he was secretary and tutor at Magdeburg, Ellrich, and Halberstadt, and in 1799 settled in Berlin. There he met the celebrated Elisa von der Recke, whom he accompanied on a journey to Italy in 1804-06, remaining afterward her faithful companion, first in Berlin and from 1819 on at Dresden, where, placed beyond material care by his friend's last will, he continued to live until death. Some lyrics, of which "Schöne Minka, ich muss scheiden" is still unforgotten, first established his reputation, and *Urania über Gott, Unsterblichkeit und Freilicht* (1800; 18th ed., 1862), a lyric-didactic poem, inspired by the ethics of Kant, enjoyed wide popularity in its day. A kind of sequel to it were the *Wanderungen durch den Markt des Lebens* (1833). Among his other poetical efforts, the *Elegien und vermischte Gedichte* (1803) met with the greatest success. After his death the Tiedge Foundation was established (1842) in Dresden for the purpose of caring for the poet's grave and of granting subventions to poets and artists or their widows and children. Administered by the Saxon Ministry of Public Instruction, its funds amounted to more than 602,000 marks, in 1901. Consult: Falkenstein, *Tiedges Leben und poetischer Nachlass* (Leipzig, 1841); Eberhard, *Blicke in Tiedges und Elisas Leben* (Berlin, 1844); and Kern, *Beiträge zu einer Charakteristik des Dichters Tiedge* (ib., 1896).

TIEFFENBRUCKER, tē'fien-bruk'ēr. See DUFFPRUGGAR, CASPAR.

TIEGHEM, PHILIPPE EDOUARD LÉON. See VAN TIEGHEM, P. E. L.

TIEL, tēl. A town in the Netherlands, Province of Gelderland, situated on the right bank of the Waal, 19 miles west of Nimeguen (Map: Netherlands, D 3). The town possesses the beautiful church of St. Mary, the church of St. Martin, dating probably from the twelfth century, and a communal college. Tiel was an

important commercial centre as early as 972, when it received municipal privileges from the Emperor Otho I. It is the principal trading place of the Neuse-Waal district. It manufactures mustard, madder, furniture, and tobacco. Pop., 1909, 10,654.

TIELE, tē'le, CORNELIS PETRUS (1830-1902). A Dutch theologian. He was born near Leyden, and studied at Leyden and Amsterdam. He then entered the ministry, being connected with the Remonstrant or Radical sect of the Evangelical church, and served churches at Moordrecht and Rotterdam (1853-72). Meanwhile he continued his theological studies and published a valuable work on Zoroastrianism, *De Godsdienst van Zarathustra* (1864). In 1866 he began with Kuenen the editing of the *Theologisch Tijdschrift* which at once became one of the leading continental reviews. In 1872 he published a *Comparative History of Egyptian and Semitic Religions*. In 1873 he became professor of theology at the Remonstrant Seminary at Leyden, and while there published a *Manual of the History of Religions* (1876), which at once took a leading place in the literature of the subject (Eng. trans., 1877). In 1877 Tiele became professor in the newly founded chair of the history and philosophy of religion at the University of Leyden, from which he retired in 1901. In 1886-88 he published *Babylonisch-assyrische Geschichte*. In 1893 he began the publication of a monumental work on *The History of Religions Down to the Days of Alexander the Great* (translated into German, *Geschichte der Religion im Alterthum*, Gotha, 1895). In 1896-97 he gave two courses of lectures at Edinburgh on the Gifford Foundation, published as *The Elements of the Science of Religion* (1897-99), and also in Holland and Germany. Consult *The Study of Religion* (New York, 1902), and L. H. Jordan, *Comparative Religion* (ib., 1905).

TIENEN, tē'nēn. A town of Belgium. See TIRLEMONT.

TIENTSIN, tyēn'tsīn'; properly T'IENTSIN (Heaven's Ford). A city and treaty port of Province of Chihli, China, situated on the eastern edge of the Great Plain, on the right bank of the Pei-ho (Map: China, L 4). It is at the junction of the Pei-ho with the Grand Canal, which, prior to the silting of the canal, afforded easy inland communication with many of the great cities of the country and bore to Tientsin the great fleets of junks engaged in the transportation from the south of the tribute-rice for the provisioning of Peking. It is 70 miles by water from the sea, and about 70 southeast of Peking. It is in rail communication with Peking, the Kaiping coal mines, Shanghai-kwan, and Manchuria, and with Paoingfu, and thence southward through Chingting with Hankow. The city, which was only a wei or military station until 1782, is comparatively small. Its walls of brick and stone are 30 feet high, nearly 4 miles in circuit, and pierced with four gates surmounted with towers. The houses are generally of brick or pressed mud, and only one story high. Like those of most Chinese cities, the streets are filthy and ill-kept. The suburbs are very large, and in them is carried on most of the trade. Pop., about 800,000. In 1860 Tientsin was opened by treaty to foreign residence and trade. The foreign settlement—known as Tsuchulin, or Red Bamboo Grove—is also situated on the right bank of the river and about 1½ miles below the city,

but within the line of circumvallation known as San-ko-lin-sin's Folly. (See SENG-KO-LIN-SIN.) It is laid out in foreign style, has a jetty or pier and a fine esplanade along the river bank, well-kept streets, fine dwellings and warehouses, gas, electric lights, and many good public buildings, such as the customhouse and the town hall, known as Gordon Hall. There are schools, hospitals, clubhouses, and the naval school established by Li Hung Chang, and within a short distance are two well-equipped arsenals. The government of the settlement is vested in a municipal council elected by and composed of the land renters.

Tientsin has no factories. Its principal manufactures are straw braid and samshu, and cured skins and tobacco. There is an immense trade in salt.

The customs collections at Tientsin for 1913 were second highest of all Chinese ports and amounted to \$3,253,966. Direct foreign imports in 1913 equaled \$38,053,534, and foreign imports from Chinese ports to Tientsin, \$15,018,693, a total of \$53,072,227. The net value of native Chinese goods imported into Tientsin in 1913 was \$18,424,399. Exports reached a total of \$28,031,010. Foreign goods sent inland from Tientsin amounted to \$27,700,000. Shipping consisted of 1001 steamers entering with total tonnage of 1,247,767, and clearances of 998 steamers with tonnage of 1,244,188. The principal imports are woolens, drills, sheetings, shirtings, jeans, twills, seaweed, sugar, rice, grain, kerosene oil, tea, opium, cigarettes, paper, munitions of war, steel, and salt (the last is a government monopoly). The articles of export are samshu, straw braid, furs, goatskins, camels' wool, coal, wood, tobacco, fruit, and rhubarb. A very large proportion of the tea consumed in Asiatic Russia is shipped from the south to Tientsin, from which point it is taken overland by caravans to Kalgan and thence to Siberian ports.

In 1853 Tientsin was besieged by a strong force of Taiping rebels on their way to Peking, but they were defeated by the Mongol general San-ko-lin-sin and driven off. In 1860 it was taken by the Anglo-French punitive expedition on its way to Peking. While Li Hung Chang was Viceroy of Chihli, from 1870 to 1895, he made his headquarters at Tientsin, and in consequence the city was the centre of much political interest. Its importance in this respect greatly declined when Li was removed from office after the disastrous war with Japan in 1894-95. During the Boxer uprising in 1900 the foreign settlement suffered from the besieging Boxers, and the city from the relieving forces of the allies. The city held out until the severe fighting of July 13-14, during which the allies lost in killed and wounded between 800 and 900, the United States contingent, in proportion to its number, suffering most. The city is connected with the rest of the world by cable. Owing to the importance of the foreign business interests centred here, and the proximity of the town to Peking, the Viceroy of the province, whose seat is at Paoingfu, spends a large portion of the year here. As the river freezes over in winter, Tientsin is cut off from the outer world from about November to April, but the foreign admirals always agree to have at least one gunboat stationed off the bund during that period. The foreign concessions are favorite places of residence for the native

Chinese merchants and business men, because of the settled and orderly conditions.

TIEPOLO, tē-a'pō-lō, GIOVANNI BATTISTA (1696-1770). The last great master of the Venetian school of painting. He was born April 5, 1696, but was not a member of the celebrated family of Tiepolo, as has been supposed. At an early age he was placed with the painter Lazzarini, a mannerist, and perhaps studied with Piazzetta. He was, however, more influenced by Veronese. It is impossible to fix the dates for his pictures before 1737. We know that he was famous long before that, and was patronized by the Doge Cornaro and noble Venetian families, and by many cities and churches in northern Italy. The first of his principal works that can with certainty be dated are the beautiful decorations of the Villa Valmerana at Vicenza, executed in 1737. The subjects are taken from Homer, Vergil, Ariosto, and Tasso. In freshness and charm, in conception and technique, they bear favorable comparison with Veronese's masterpieces in the Villa Maser. In 1739 followed the three ceiling decorations in Santa Maria del Rosario (Venice), including the "Institution of the Rosary," and in 1743-44 those of the church of the Scalzi, the chief of which represents "Angels Bearing the Casa Santa from Nazareth to Loreto" (these were ruined by an Austrian bomb in 1915). To the same period belong the ceiling paintings of the Palazzo Rezzonico, and about 1745 he decorated the grand hall of the Palazzo Labia. The ceiling is highly fantastic, and the illusive architectural decorations of the walls form an admirable framing for two of his best frescoes, "Cleopatra's Banquet" and the "Embarkment of Cleopatra and Antony." The date of his decorations in the archiepiscopal palace at Udine, one of his best works, is not known.

Under the patronage of Karl Philipp of Greifenklau, Bishop of Würzburg, Tiepolo passed the years 1750-53 in that city, engaged in decorating the episcopal (now the royal) palace. On the lofty ceiling over the grand staircase he painted frescoes of "Olympus" and of the "Four Quarters of the Earth"; in the Kaisersaal, three scenes from the life of Frederick Barbarossa; in the chapel, two large altarpieces, the "Ascension of the Virgin" and the "Fall of the Angels." Returning to Venice in 1754, he became director of the Venetian Academy. Between this time and his departure for Spain he painted another grand ceiling decoration, the "Triumph of Faith," in the Chiesa della Pietà, and perhaps most of his easel pictures. In 1763 he was summoned by King Charles III to Spain to decorate the royal palace. In the guard room he painted the "Smithy of Vulcan," in the ante-room an "Apotheosis of Spain," and in the throne room magnificent ceiling frescoes of "Spain and her Provinces." At Madrid he executed most of his etchings, about 50 plates, the most important, showing the influence of Goya, being the series *Scherzi di Fantasia*. He died at Madrid, March 22, 1770.

In the classical reaction immediately following Tiepolo's death, scant justice was done him, and not until comparatively recent times has he been accorded his place. His art is essentially decorative, and harmonizes perfectly with the rococo architecture of the day. The color is light and flaky, and exquisitely delicate, and the treatment of light is above reproach. To a wonderfully rich fantasy and invention he

joined an equal facility of execution. Sometimes he degenerates into extravagances, and what prevents him from ranking with the greatest artists of all time is the frivolity of his conceptions and the artificiality consequent upon the lack of a more direct contact with nature.

Tiepolo's easel pictures show the same grace of form and charm of color as his frescoes, and are more carefully composed and executed. Among the best known are "Christ in the Garden of Olives" and "Calchas and Iphigenia," in the Lichtenstein Gallery at Vienna; "St. Catharine of Siena" and an "Adoration of the Kings," in the Imperial Gallery (ib.); "Martyrdom of St. Agatha" and "After the Bath," in the Berlin Museum; the "Immaculate Conception" at Vicenza and Madrid; and a "Holy Family with St. Gaetano," in the Venetian Academy. In the Venetian churches are several altarpieces, like "Madonna in Glory" in the church of the Jesuits, and "Christ Bearing the Cross" in Sant' Aluise. He is represented in the Metropolitan Museum, New York, by five canvases, including two sketches for ceiling decoration. Of his two sons, who assisted in most of his works, DOMENICO (1727-1804) etched several of his father's paintings and painted inferior frescoes in his style, while of LORENZO, the younger son, almost nothing is known.

Meissner, "Tiepolo," in *Künstler-Monographien*, vol. xxii (Bielefeld, 1897); *Masters in Art*, vol. vi (Boston, 1907); P. G. Malmonti, *G. B. Tiepolo, la sua vita e le sue opere* (Milan, 1909), the most complete monograph on the subject.

TIERCE (OF, Fr. *tiers*, third part, from Lat. *tertius*, third, from *tres*, three). In music, an interval (q.v.) synonymous with a third. In the organ, a mutation stop pitched $2\frac{1}{3}$ octaves above the diapason.

TIERCE. In heraldry (q.v.), a term of blazon used to indicate that the field is divided by lines into three equal parts of different tinctures.

TIER/CEROON. See QUADROON.

TIERGARTEN, *tär'gür-ten* (Ger., Zoölogical Garden). The largest park of Berlin, on the south side of the Spree and west of the Brandenburg Gate. It contains 600 acres and is about 2 miles long. It contains a number of fine statues and the column of victory from which the Siegesallee, the most fashionable drive of the city, leads south.

TIER/NEY, GEORGE (1761-1830). An English politician. He was born at Gibraltar, Spain, was educated at Eton and Cambridge, and in 1778 entered Parliament as a Whig. There he soon acquired a high reputation as a debater, and, after Fox's withdrawal, became a prominent, if not the leading opponent of Pitt's policy. For several years it was his custom to bring forward a series of resolutions opposed to those of the Chancellor of the Exchequer. He was finally accused by the latter of deliberately impeding public business, and as a consequence fought a bloodless duel with him. In 1803 he

became Treasurer of the Navy and a Privy Councillor, and after acting as Secretary of State for Ireland (1806) was President of the Board of Control (1806-07) and Master of the Mint in Canning's ministry (1827-28). After 1817 he was the recognized leader of the Opposition.

TIERRA DEL FUEGO, *tê-ër'rá del fwá'gô* (Sp., Land of Fire; formerly often written in the corrupted form *TERRA DEL FUEGO*). An archipelago between lat. 52° 40' and 55° 59' S., off the extreme south end of South America, from which it is separated by the Strait of Magellan (Map: America, South, C 8). It consists of a large main island sometimes called King Charles South Land, and a number of smaller islands, lying to the west and south of it, the southern group being separated from the main island by Beagle Channel. The total area of the archipelago is estimated at over 27,000 square miles, of which the main island occupies more than four-fifths. The principal of the smaller islands are, beginning at the northwest, Desolación, Santa Inez, Clarence, Hoste, Navarin, Wollaston, and at the extreme south, Horn Island, ending in Cape Horn. At the extreme east lies the isolated Staten Island or *Isla de los Estados*. All these islands are separated from each other and from the mainland by narrow, deep, and tortuous channels, and are, together with the west coast of the main island, deeply indented by narrow fiords. The east coast is more regular. The Andean mountain system is continued in several ranges through the western part of the archipelago, covering all the smaller islands and the western half of the main island. They are mostly of Mesozoic formation with considerable granitic and volcanic intrusions, though there are no volcanoes. Their height averages 3500 feet, and Mount Sarmiento, an imposing snow-clad peak on the southwestern peninsula of the main island, has an altitude of 7200 feet. The eastern half of the main island is a continuation of the Patagonian plateau.

The climate of Tierra del Fuego is not so rigorous as it was formerly supposed to be. It is an equable oceanic climate with no extreme heat or cold. A meteorological station established since 1896 at Ushuaia on Beagle Channel shows a mean temperature for January to be 52.7° and for July 31°. The rainfall is greater than on the Patagonian plateau, and the country is more favorable for settlement than the more northern regions. The eastern region has good soil and pasture land, and along the base of the mountains there are extensive forests of beech (*Fagus antarctica*) and pine. The western islands, not yet thoroughly explored, are less favorable as regards climate and soil, but in the east and along Beagle Channel hardy cereals will ripen, and considerable areas of land have already been brought under cultivation by white settlers. Agriculture and cattle raising are the main occupations, though gold has been found in paying quantities, and seams of lignite have also been discovered. The native Fuegians are rapidly disappearing, and now number probably less than 1000. They belong to three distinct tribes—the Aliculfis in the central regions, the Onas in the west, and the Yaghans in the south. Politically the portion of the main island lying east of a line running from the eastern entrance of the Strait of Magellan to the middle of Beagle Channel, together with the *Isla de los Estados*, constitutes the Argentine Territory of Tierra

del Fuego (q.v.). (See also ARGENTINA, *History*.) The remaining portions belong to the Chilean Territory of Magallanes. The civilized population of the Argentine Territory, which contains practically all the inhabitants, was 2500 in 1912. The archipelago was discovered by Magellan in 1520, but not systematically explored until late in the nineteenth century.

Bibliography. Bove, *Patagonia, Terra del Fuoco* (Genoa, 1883); Hyades and Deniker, *Anthropologie et ethnographie* (Paris, 1891); W. Conway, *Aconcagua and Tierra del Fuego* (London, 1902); R. Crawshaw, *The Birds of Tierra del Fuego* (ib., 1907); Wilhelm Rünz, *Das Feuerland nach seiner Geschichte, seiner Natur, und seiner Bewoohner* (Ahrweiler, 1910).

TIERRA DEL FUEGO. A territory of Argentina, formed of a portion of the main island of the Archipelago of Tierra del Fuego (q.v.) and of the Isla de los Estados (Map: Argentina, F 8). Its area is about 8299 square miles. The territory of the island was in dispute until 1881, when by arbitration of the United States it was divided between Chile and Argentina. The territorial government of the Argentine portion was organized in 1884. The principal river is the Popper. The chief industries are lumbering, seal fishing, and sheep raising. Pop. (est.), 2500, not including the Indians of the Ona tribes. The capital is Ushuaia (q.v.).

TIERS ÉTAT, tē-ār' zā'tā'. See STATES-GENERAL.

TIES, RAILWAY. See RAILWAYS.

TIETJENS, tē'tyēns, or **TITIENS**, TERESA (1831-77). An operatic singer, born at Hamburg, of Hungarian parents. She made her debut in that city in the character of Lucrezia Borgia in 1849, taking at once a very high position on the lyric stage; at Frankfort and Vienna she was even more warmly received; and her first appearance in London in 1858 was a complete triumph. After this she remained permanently in London, making only two more tours, one to Paris (1863) and one to the United States (1875). She died in London. The great volume and purity of her voice and her sympathetic and dignified acting combined to make her famous in strong dramatic parts.

TIFFANY, CHARLES COMFORT (1829-1907). An American Protestant Episcopal clergyman. He was born in Baltimore; studied at Dickinson College, at Andover Theological Seminary, and at Halle, Heidelberg, and Berlin; and was ordained priest in 1866. He was rector at Fordham, N. Y. (1867-70), assistant rector at Trinity Church, Boston (1871-74), rector in New York (1874-90), and Archdeacon of New York (1893-1902). His publications include *History of the Protestant Episcopal Church* (1895) and *The Prayer Book and Christian Life* (1897).

TIFFANY, CHARLES LEWIS (1812-1902). An American merchant. He was born at Killingly, Conn., and after receiving an academic education at Plainfield Academy, and serving an apprenticeship in a cotton manufactory, he removed to New York City in 1837. There in partnership with a fellow townsman, John B. Young, on a borrowed capital of \$1000, he established at 259 Broadway, next door to A. T. Stewart's, a stationery and fancy-goods store. The venture prospered, and gradually the jewelry part of the business became the most important. In 1847 the firm began the manufacture of gold jewelry. In 1848, when as a result of widespread revolutionary movements in Europe the

price of diamonds fell one-half, Mr. Tiffany sent word to his partner, who was then in Paris, to buy all the diamonds he could. This was done; the house reaped a large fortune and became one of the principal firms of diamond merchants in the world. Several times rapidly increasing business necessitated moving farther up town and the firm name was changed somewhat, finally becoming Tiffany & Co. in 1851. At that time a branch house was established in Paris. During the Civil War Mr. Tiffany placed his store and resources at the disposal of the government, and it became for a time one of the principal depots of military supplies. During the draft riots (q.v.) in 1863 the store was barricaded and the clerks were armed in preparation for a threatened attack of the mob. In 1868 the firm was incorporated and in 1870 removed to a specially constructed building on Union Square. At that time, in addition to the Paris branch, a branch house was maintained in London, and an office and watch factory in Geneva, Switzerland, and the house took rank as the leading importers of gems and works of art as well as the chief manufacturing jewelers in America. In 1905 the firm removed to a splendid new building at Fifth Avenue and Thirty-seventh Street. Mr. Tiffany was the first to adopt the department-store plan for the jewelry business and was the originator of many ideas and methods in the jewelry trade since generally adopted. The sterling silver standard 0.925 fine, adopted by him in 1851, became the recognized standard throughout the country. Mr. Tiffany was made a member of the French Legion of Honor in 1878 and received at various times decorations from other foreign rulers. He was a liberal patron of the fine arts, and did much to encourage and promote the study and knowledge of art in America. For his son, see TIFFANY, LOUIS COMFORT.

TIFFANY, LOUIS COMFORT (1848-). An American decorative designer and painter. He was born in New York City, a son of Charles Lewis Tiffany (q.v.), and studied under George Inness and Samuel Coleman, and in Paris with Léon Bailly, making a special study of the decorative arts in their relation to architecture. After his return to the United States he devoted himself to stained glasses, enamels, and other decorative work in connection with the Allied Arts Company and the Tiffany Studios, New York, of which he became director. He introduced the art of mosaic in America, producing designs of strength and fine decorative quality. His best-known invention is the Tiffany favrile glass, which possesses delicate refracting powers capable of iridescent effects. Louis Tiffany made paintings on glass to serve as windows in the old Columbia University Library; in Memorial Hall, Harvard; and in Chittenden Library, Yale; and for numerous churches, including the church of the Pilgrims, Brooklyn, and All Angels Church, New York. His principal mosaics are in the crypt of St. John's Cathedral, New York. Good examples of his easel paintings, principally Oriental scenes, are: "Algerian Shops" (1895) and "The Pool" (1896). He was elected a member of the National Academy in 1880, and Chevalier of the Legion of Honor (1900). His numerous prizes include gold medals at Paris (1900), Buffalo (1901), Dresden (1901), St. Louis (1904), Jamestown (1907), and San Francisco (1915). Consult *The Art Work of Louis C. Tiffany* (Garden City, N. Y., 1914).

TIFFIN. A city and the county seat of Seneca Co., Ohio, 42 miles southeast of Toledo, on the Sandusky River, here spanned by several bridges, and on the Baltimore and Ohio, the Pennsylvania, and the Cleveland, Cincinnati, Chicago, and St. Louis railroads (Map: Ohio, D 3). It is the seat of Heidelberg University (Reformed), opened in 1850, and of the College of the Ursuline Sisters, and has the National Home of the Junior O. U. A. M. and a public library. Other prominent features are the courthouse and Riverview Park. Among its manufactures are tools, pottery, glass, emery wheels, elevating and hoisting machinery, church furniture, agricultural implements, wagons, well-drilling machines, nail, bolt, and nut machines, underwear, gloves, and woolen goods. Pop., 1900, 10,989; 1910, 11,894; 1915, 12,370; 1920, 14,375.

TIFFIN, EDWARD (1766-1829). An American physician, preacher, and political leader. He was born at Carlisle, England, removed to Charlestown, Va., about 1786, and graduated in medicine at the University of Pennsylvania in 1789. In 1792 he became a local preacher in the Methodist church, and also studied law. About 1798 he removed to Chillicothe, in the Northwest Territory, and in 1799 was Speaker of the Territorial Legislature. In 1802 he presided over the convention to frame a State constitution of Ohio, and was the first Governor of the State (1803-07). During his second term he arrested the Burr-Blennerhasset expedition. In 1807-09 he was a member of the United States Senate, but resigned, and in 1809 was Speaker of the Ohio Legislature. When the General Land Office was established in 1812, President Madison appointed Tiffin the first Commissioner, and by his foresight the latter saved all the papers when the Capitol was burned by the British troops in 1814. From 1815 until just before his death he was Surveyor-General of the Northwest Territory.

TIFLIS, *Russ. pron. tyéf-lyēs'*. A government in the centre of Transcaucasia, Russia. Area, 23,146 square miles (Map: Russia, F 6). It belongs to the region of the Caucasus (q.v.) and contains numerous snow-clad peaks, including Kazbek, over 16,000 feet in height. Between the mountain chains are deep and narrow valleys, which make Tiflis one of the most picturesque and striking parts of the Caucasus. The principal river is the Kur. The climate is very severe in the mountainous region. About one-third of the total area is covered with forests. Agriculture is the principal occupation in the valleys and stock raising in the mountain regions. Besides cereals, of which wheat is the most important, fruits, especially grapes, are extensively raised. Various metals occur and copper is mined to some extent. The chief manufactures are flour, cotton goods, tobacco, spirits, etc. The natives produce various woolen articles, such as felt, rough cloth, etc., copper and silver articles, silver thread, fligree work, etc. Pop., 1912, 1,202,500, of whom the Georgians and the Armenians constituted 45 and 24 per cent, respectively, and the Russians less than 5 per cent.

TIFLIS. The former Georgian capital, the administrative centre of the Caucasus, and the capital of the Government of Tiflis, situated on the Kur, about 340 miles by rail northwest of the seaport of Baku (Map: Russia, G 6). The town presents a very mixed appearance. The Russian quarter is well built, with handsome churches and public buildings and European

shops, while the native quarter is built in Oriental fashion. The most noteworthy ecclesiastical structures are the ancient cathedral of Zion, containing interesting icons and manuscripts; the monastery of St. David; and the old church in the fortress, supposed to date from the fifth century. There are a natural-history museum with a library, a sericultural station with a museum, and extensive botanical gardens. Agriculture is its chief occupation. Lying at the intersection of the trading routes from the Caspian to the Black Sea and from the Armenian uplands across the Caucasus, Tiflis enjoys considerable prosperity. The principal manufactures are felt, cotton goods, woolens, carpets, leather products, oil, wine, and tobacco. The trade, mostly in Armenian hands, is very extensive, Tiflis, in virtue of its railway connection with the two main seaports of the Caucasus, as well as with European Russia, being the distributing centre for Transcaucasia. Pop., 1913, 350,000, principally Armenians, Georgians, and Russians. The environs abound in sulphurous springs. The city is very hot in summer, when its mean temperature is 74° F.

TIGER (Lat. *tigris*, from Gk. *tylops*, tiger; probably connected with Av. *tygra*, arrow, *tygra*, sharp). The largest and most powerful of cats, *Felis tigris*, and the most specialized and efficient of the Carnivora, comparable only with the lion, and very similar in size and structure, but different in appearance and habits. It is more slender and catlike than the lion, with a rounder head, no trace of a mane, but with hair of the cheeks rather long and spreading. Its skull may be distinguished from that of the lion by the fact that the nasal bones reach backward beyond the frontal processes of the maxillae. The males are larger than the females, and make a more square, less oval footprint or "pug." The pupil of the eye is round, however much contracted. The average size of an adult male is 9½ feet from nose to tip of tail. Authentic measurements exceeding 11 feet are very rare, and stories of 15 to 18 feet entirely erroneous. Its height at the shoulder is proportionately less than that of the lion, a large male measuring from 3½ to 3¾ feet. A 10-foot tiger will weigh about 500 pounds. The hair is thick, fine, and shining; in the colder countries thicker and longer than in tropical regions. The color is a bright tawny yellow, beautifully marked with dark transverse bands, passing into pure white on the underparts; the dark bands are continued as rings on the tail, which is long and tapering and has no terminal tuft. These colors and stripes so blend with the gloom and slender shadows of the bamboo jungle or long grass as to make a lurking animal practically invisible.

The tiger inhabits Asia, where it has an extensive but rather localized distribution. Westwardly its range extends to the lower Euphrates and the southern shores of the Caspian; but it does not occur in Persia south of the Elburz Mountains, nor in Beluchistan or Afghanistan. Northward, it is to be found throughout southern Siberia and Mongolia, eastward in the Amur valley to the Sea of Okhotsk, in Sakhalin and Japan. The elevated Tibetan plateau has no tigers. Southward the species ranges throughout China, Siam, Burma, the Malay Peninsula, Sumatra, Java, and Bali, and all of India, but is unknown in Ceylon. This is an evidence leading naturalists to conclude that the tiger is a

comparatively recent immigrant into the south, and not naturally a tropical species.

In general the tiger is an inhabitant of woods and thickets and although able to leap into or climb trees (except smooth, perfectly upright ones), it does so only for some special purpose. Usually it hides in dense cover by day and roams for prey at night. It is most numerous in the swampy shore jungles around the Bay of Bengal and on the Malayan coasts and marshy estuaries, where it swims miles from island to island or across rivers and inlets.

Its prey consists of almost anything in the way of flesh, from a bison or crocodile to any small creature which it may strike down. Carnion may be eaten under stress of famine, but as a rule the animal devours only what it has itself killed, and ordinarily does not even return to a carcass from which it has taken one full meal. It stalks its prey, or lies in ambush and leaps upon it like other cats; and its method of killing large animals is to seize the shoulders with one paw, grasp the forehead with the other, and break the neck by a twisting pull. A band of bison or wild oxen, guarded by bulls (see BISON), will beat it off and often kill it; even a single bull in favorable circumstances is a match for it. The elephant and rhinoceros have little to fear, and a bear will make a stout resistance, but such encounters rarely occur; nor do fights between male tigers seem to be common, as this cat is not, like the lion, polygamous. In India and eastward the tiger subsists largely upon domestic cattle and hogs, and upon human beings. Man-eaters, when they do not wholly depend upon human victims, apparently prefer them; many, but not all, of these victims are old and feeble. The destruction of human life in India and eastward is great, and there seems little diminution in spite of improved arms, number of sportsmen, and government rewards. In 1902 about 1300 lives were so lost in British India alone. The prey when struck down is usually carried away by the tiger to be eaten elsewhere, and many stories of the tiger's strength have been related. A tiger will lift from the ground and partly carry, partly drag, an animal of 200 or 300 pounds' weight, with considerable ease.

Tigers are solitary beasts, rarely hunting even in pairs, and much less noisy than the lion. Their usual call is a prolonged, moaning, thrilling sound, repeated twice or thrice and becoming louder or quicker. In the cooler season they wander widely, but in the hot weather remain in some narrow district near water—a single one in each beat. Tigresses breed irregularly, once in two or three years only, regardless of season, and produce usually two cubs, almost invariably one male and the other female. The cubs require three years to reach maturity and stay with their mother most of this time. When caught young tigers may easily be tamed, but are more difficult to rear and less tractable than lions. Captive and tamed tigers have been kept by the East Indian rulers from the days of antiquity, and a favorite amusement was to pit them in the arena against lions, in which combats they were usually victorious. The royal Bengal tiger has been a part of the showman's stock in trade ever since, and is to be seen in every menagerie, where these animals breed, but less readily than do the lions. Some have been trained to go through certain performances.

See TIGER HUNTING; HUNTING BIG GAME; Colored Plate of FELIDÆ accompanying article LION.

TIGER BEETLE. One of the active, predatory beetles of the family Cicindelidae. Of carnivorous beetles they are among the most active, voracious, and fierce, whence their name. They frequent sandy places and earthen paths, and when approached run rapidly for some distance, occasionally turning suddenly back, and often taking to flight. While variously colored, and sometimes even bright green spotted with yellowish, they harmonize as a rule with the general color of their environment. Their larvae live in deep, straight vertical burrows in the ground, and station themselves near the burrow's mouth, holding themselves in position by means of a pair of strong hooks on the fifth segment of the abdomen. The head and thorax are broad, and are used to block the mouth of the burrow while waiting for prey. The food consists of insects which alight on the spot or run over it. Some 1500 species are known, the majority inhabiting the tropics. Some species are wingless, others very active; some are found only on the mounds of termites; some frequent the trunks of trees, which they ascend in a spiral manner. Less than 100 species are known in the United States, but tiger beetles are abundant and are seen everywhere. The largest American form is *Amblychila cylindriciformis*, found in sandy regions in the mid-Western States. *Tetracha carolina* and *Tetracha virginica* are large greenish species occurring in the Atlantic and Southern States. The genus *Cicindela* contains more than half the species in the entire family, and a great majority of the forms which are found in North America. A typical American species, the spotted tiger beetle (*Cicindela sex-guttata*), is depicted upon the Colored Plate of INSECTS.

A TIGER BEETLE.

TIGER CAT. Any wild cat of medium size which resembles the tiger in form or markings. The ocelot, serval (qq.v.), and especially the chati (*Felis mitis*) of South America, and clouded tiger of India, are frequently so called. See WILDCAT.

TIGER EYE. See CROCIDOLITE.

TIGER FLOWER (so called from the coloring), *Tigridia pavonia*. A plant of the family Iridaceæ, distinguished by the three large outer segments of the perianth and by the filaments being united into a long cylinder. It is a native of Mexico, but hardy enough to endure the climate of the United States, and it is often cultivated in flower gardens for the singularity

and great beauty of its ephemeral flowers. The root is a scaly bulb.

TIGER HUNTING. A sport which probably taxes man's skill and courage in a higher degree than the pursuit of any other sort of game, and may justly be placed first in the lists of the chase. The enormous strength of the beast, coupled with savage cunning, renders it the most formidable of brute foes. Nothing is more patent in the voluminous history of the sport (see **TIGER** for outline of pertinent literature) than that no two tigers behave in the same way when encountered; the same animal may act differently at different times. Tigers learn by experience, have no fear of man as man, and rarely make tactical mistakes. In some parts of India hunters in parties go after them on foot, but this is regarded as extremely rash; the hunter's handicap is far too great, and few men dare its risks. Methods usually chosen are: (1) lying in wait for the animal at night (when there is moonlight) on an elevated platform, or (2) seeking him upon the back of a trained elephant. The former is the choice in cases where a tiger is known to haunt a particular locality. The hunter then chooses a likely spot and builds a platform or machan (usually in a small tree), which must be raised not less than 12 feet above the ground, and be large enough to hold two persons. On the ground near by is placed the carcass of a deer or cow; an even better bait is a tethered live goat. An hour before sunset the hunter, with a native assistant, climbs upon the platform and awaits the coming of the tiger. Sometimes the animal steals out of the shadows and seizes and carries off the prey too quickly for a shot. Again it will stalk boldly out and stand in full view. Sometimes when fired at, but not killed, it darts back into the jungle and disappears, but it may also attack and tear down the machan, or lurk near by to seize the men when they descend.

The most effective method of hunting the tiger is by means of elephants, and with the aid of native shikaries and beaters. Frequently the preparations are upon a scale of royal magnificence, for so kings and princes are accustomed to entertain one another in the East, especially when a native ruler desires to honor or gratify some European guest or ally. On such occasions the game has been surrounded and watched for days by an army of natives. King Edward VII was thus entertained when visiting India as the Prince of Wales. The method is to surround the tiger by a sufficient number of beaters, who by noise of drums drive it towards the favorable spot where the sportsmen are waiting upon the backs of elephants, which are furnished with open, boxlike howdahs. As the circle narrows the drivers become more cautious, for the animal knows the country perfectly, and will make use of every means of escape or attack. Men are stationed in trees to try to trace his movements and warn by cries and signs. Meanwhile the sportsmen press forward on their elephants, depending largely upon the sagacity of these animals for a warning of the terrific and usually unforeseen charge of the animal, which may by a bold leap tear the hunter from the howdah, or stampede the elephant, or get through the barrier alive. Nine out of ten elephants, even if stanch before, will become panic-stricken and bolt, when the danger of their riders being dashed against a tree and killed is imminent. Unforeseen casualties are numerous,

and the reward is only a hide, which may often be of inferior beauty and value.

TIGER LAKE. See **NAHUEL-HUAPI**.

TIGER LILY. See **LILY**.

TIGER MOTH. A name applied on account of their coloration to certain moths of the family *Arctiidae*, as *Arctia nans*, and especially to the *Isabella* tiger moth (*Isia isabella*), an American species, grayish yellow with black markings. The caterpillar is known as the woolly bear, and is densely clothed with reddish brown and black hairs. It feeds upon a great variety of low-growing herbage. See Colored Plate of **AMERICAN MOTHS**, under **MOTH**.

TIGER SHARK. The largest, fiercest, and most formidable of West Indian sharks (*Galeocerdo tigrinus*), brown in color, with numerous small dark spots which give the fish its name, but grow indistinct with age.

TIGER SNAKE. An elapine, poisonous snake (*Hoplocephalus curtus*) of Australia. See **DEATH ADDER**.

TIGERT, JOHN JAMES (1856-1906). An American Methodist bishop, born in Louisville, Ky. He graduated from Vanderbilt University in 1877 and later studied at the Southern Baptist Theological Seminary. Between 1881 and 1890 he was tutor and professor of moral philosophy in Vanderbilt University. He entered the ministry of the Methodist Episcopal Church South in 1890. From 1894 to 1906 he was the editor of the *Methodist Quarterly Review* of Nashville and the book editor of the Methodist Episcopal Church South. In 1906 he was elected bishop. He edited several works, among them *The Doctrines of the Methodist Episcopal Church in America* (2 vols., 1902), and wrote: *A Constitutional History of American Episcopal Methodism* (1894; 2d ed., revised and enlarged, 1904); *The Making of Methodism* (1898); *Theism* (1901); *The Christianity of Christ and his Apostles* (1905).

TIGER WOLF. See **DASYURE**.

TIGHE, MRS. MARY (BLACHFORD) (1772-1810). An Irish poet. Her father, a clergyman, was a librarian in Dublin. In 1793 she married her cousin, Henry Tighe, a member of the Irish Parliament. Mrs. Tighe was greatly admired for her beauty, and for her poem, in Spenserian stanzas, *Psyche, or the Legend of Love* (privately printed in 1805). The poem was a version of the story of Cupid and Psyche in the *Golden Ass* of *Apuleius*. This and other poems were published in 1811, with a portrait after a painting by Romney.

TIGLATH-PILESER (Heb.; Ass. *Tukulti-apal-E-sharra*, My confidence is the son of Esharra, i.e., Ninib). The name of several Assyrian kings: 1. Tiglath-pileser I (c.1140-1105 B.C.) was the son of Asurnisii II. Under him the dominion of Assyria was considerably enlarged by conquests in northern Syria, Comagene, Melitene, Cappadocia, Armenia, and Kurdistan. He claimed to have conquered no less than 42 countries, and in his days Babylon was forced to acknowledge Assyrian supremacy. He placed his statue on the Supnat, a tributary of the Tigris. Twice he invaded the south and entered the city of Babylon itself. His activity in rearing temples and palaces was no less remarkable, and he devoted himself especially to the embellishment of the old city of Assur (q.v.) on the Tigris, which he once more made the seat of government in place of Calah. Although he was able to hand over the succes-

sion to his son Asurbelkala, his great empire was not maintained, and shortly afterward a period of decay set in. 2. Tiglath-pileser II (c.1050 B.C.) is little known. 3. Tiglath-pileser III (c.950 B.C.) apparently belonged to the same dynasty, but no inscriptions by him throw any light upon his reign. 4. Tiglath-pileser IV (745-728 B.C.) was a usurper. Rising from obscurity, he either set on foot a rebellion against Asurnirari IV, or availed himself of an opposition that had sprung up against this King to seize the throne for himself. He assumed the name of Tiglath-pileser as King, his original name having been Pulu or Pul, by which he continued to be known in Babylonia and which is given to him likewise in the Old Testament (2 Kings xv. 19). To reinforce his position he proceeded to the south and brought to submission the Aramæan tribes, who had been causing the Babylonians considerable trouble. Securing in this way the good will of the Babylonians, by whom he was hailed as a deliverer, he could devote himself to the troublesome neighbors in Media to the east of Assyria. Two expeditions were required before the pacification of the country was secured. Tiglath-pileser IV appears to have introduced the policy of planting Assyrian colonies in hostile districts with a view of thus making Assyrian influence a more permanent factor than could be accomplished merely by military invasions. Successful also in breaking up a combination that had been formed against him in Ararat under the leadership of Sarduris II, aided by a group of allies in Asia Minor, he secured a large booty in a battle in which he claims to have captured no fewer than 72,950 soldiers of the enemy. He encountered more difficulty in quelling a revolt in northern Syria in 742-740 B.C. As early as 739 B.C. there was a conflict between the Assyrians and Azariah of Jaudi. The King overthrew Azariah and his allies and again showed his administrative abilities by placing the hostile district, divided into small principalities, under Assyrian governors. He enumerates in his inscriptions a long list of rulers of petty states in Asia Minor and Syria who brought him tribute, and among these we find Menahem of Samaria, the notice thus confirming the statement in 2 Kings xv. 19-21.

In 734 B.C. Tiglath-pileser IV again proceeded to the west, being appealed to by Ahaz, King of Judah (2 Kings xvi. 7), to assist him against the combination formed by Pekah, King of Israel, and Rezin of Damascus. Rezin was defeated and fled to his capital, and while a portion of the Assyrian army laid siege to it, another section was sent to ravage and plunder the Syrian, Israelitish, and Philistine towns. In 732 B.C. Damascus fell and an Assyrian official was appointed governor. Among those who hastened to pay homage to Tiglath-pileser, we find his vassal King Ahaz of Judah. This visit is the one referred to in 2 Kings xvi. 10. Tiglath-pileser IV also claims to have deposed Pekah of Israel and to have put Hoshea in his place. According to the biblical statement (2 Kings xv. 30) Pekah was murdered in the course of a revolt instigated by Hoshea, who no doubt was abetted by the Assyrian King. Shortly after his successful campaign in Syria and Palestine, Tiglath-pileser IV was obliged to proceed once more against Babylonia, where trouble had broken out. Two years elapsed before he could take the decisive step of having himself

crowned King of Babylonia. The ceremony took place on the Babylonian New Year's festival of the year 728 B.C. As King of Babylonia he assumed his original name of Pulu (identical with Parus in the Ptolemaic canon). Not long afterward, in 728 B.C., he died, leaving his policy of political centralization to be carried on by his son Shalmaneser V. Consult the Babylonian-Assyrian histories of Winckler, Tiele, Hommel, Rogers, Johns, and other works quoted in the article on ASSYRIA.

TIGLIUM, OIL OF. See CROTON OIL.

TIGRANES (Lat., from Gk. *Τυγράνης*, Armen., *Tigran*). The name of several kings of ancient Armenia. The most famous was Tigranes the Great, who was born about 121 B.C. He was for many years a hostage at the Parthian court, but was exchanged for 70 districts about 95 B.C., when he succeeded to the throne. He made an alliance with his father-in-law, Mithridates (q.v.), King of Pontus, against the Romans. About 83 B.C. he conquered Syria, later extending his power over much of Asia Minor, besides taking from the Parthians Mesopotamia and other provinces. In 71 B.C. Mithridates fled to him for refuge from the Roman general Lucullus (q.v.). In 69 B.C. Tigranes was defeated by the Romans at Tigranocerta, his newly founded capital, although a mutiny prevented Lucullus from following up his advantage. Three years later Pompeius (q.v.) took the field against the Armenians, and in 64 B.C. after a long siege compelled Tigranes to surrender at Artaxata. He remained in possession of Armenia Major, and died about 56 B.C., being succeeded by his son Artavasdes. Consult Théodore Reinach, *Mithridate Eupator roi de Pont* (Paris, 1890).

TIGRÉ, *tê-grâ'*. The northernmost of the three divisions of Abyssinia proper, lying north of the Bahr el Aswad (Map: Egypt, D 5). The capital is Adowa (q.v.). Tigré contains the town of Axum (q.v.), which is noted for its antiquities and which was the capital of the old Ethiopic empire. The language of the country is Tigrina, a Semitic dialect which more nearly resembles the ancient Geez than does the Amharic (q.v.). Tigré is administered by a ras and is variously called a division, a province, or a kingdom of the Abyssinian Empire.

TIGRIS (Greek, from the old Persian *tigra*, an arrow). One of the two large rivers which inclose the historic region of Mesopotamia, in Asiatic Turkey (Map: Turkey in Asia, E 3). Its origin is usually traced to the southern flank of the eastern Tauric Mountains south of Kharpur, but the Bitlis and Botan springs, on the south slope of the Van Mountains, supply the greater head of water. Thence it flows in a winding southeast course of about 950 miles till it joins the Euphrates at Korra to form the Shat el Arab, which after a short course flows into the Persian Gulf. The Tigris is a rapid and turbid stream. In its upper course it receives numerous tributaries from both sides. Below Mosul, the tributaries come nearly all from the east, the region between the Tigris and the Euphrates being here a desert overgrown with wormwood and similar scrub. Farther down the Tigris communicates across the desert with the Euphrates by a number of bayous or canals, some of which are dry the greater part of the year. At the confluence the Tigris, though shorter than the Euphrates, is more voluminous, and it is navigable for steamers to

Bagdad, above which foreign steamers are not allowed. Thence smaller vessels proceed to Mosul, and above that city rafts descend (they are broken up and transported back by camel) from Diarbekir, almost at the source of the river. The main tributary of the Tigris is the Diyala, which joins it from the east, a short distance below Bagdad, and which is navigable for some distance by small vessels. Next to the Diyala, the largest affluent is the Greater Zab. Outside of the three cities mentioned the banks of the Tigris are very thinly populated. Among the remains of ancient cities on the banks of the Tigris are those of Nineveh, Seleucia, and Ctesiphon.

TIGUA, tē'gwā. A group of pueblos in New Mexico speaking a Tanoan language. See **TANOAN** SROCK.

TIKUS. See **BULAU**.

TILANUS, tē-lā'nus, CHRISTIAN BERNARD (1796-1883). A Dutch surgeon, born at Harderwijk. He studied medicine at Utrecht (M.D., 1819) and became, in 1828, professor of surgery and gynecology at Amsterdam. Before his time the teachers of surgery in the Netherlands, who were also anatomists, had taught the subject from the theoretical standpoint only, while practice was left to a less highly educated clan of surgeons. Tilanus was a practical surgeon as well as a professor. In 1848, at his instance, a chair of gynecology, separate from surgery, was founded. He retired in 1872, but his influence upon surgical education in Holland continued to be of great importance.

TILBURG, til'berg. A manufacturing town in the Netherlands, Province of North Brabant, 36 miles southeast of Rotterdam, and 19 miles east of Breda (Map: Netherlands, D 3). The town has a new church in the Gothic style, and a cloth hall, and is besides an important manufacturing centre, with more than 300 factories, most of them woolen and cloth mills, and tanneries, and iron foundries. Pop., 1910, 50,326.

TILBURY, GERVASE OF. See **GERVASE OF TILBURY**.

TILBURY FORT. A fortification in Essex, England, on the north bank of the Thames, opposite Gravesend, 30 miles below London (Map: England, G 5). Originally erected in the time of Henry VIII as a blockhouse, it was converted (1667) into a regular fortification after the bold expedition of De Ruyter into the Thames and Medway, and has been greatly strengthened since 1861. The large docks, comprising 588 acres, are important, as the passenger traffic with London by steamship centres here.

TILDEN, DOUGLAS (1860-). An American sculptor. He was born at Chico, Cal., and studied at the National Academy of Design, New York, with Ward, Flagg, and Mowbray, and for several years under Paul Chopin in Paris. Afterward he was professor of sculpture at the Mark Hopkins Art Institute, University of California (1894-1900). Good examples of his work, which is modern in spirit and treats typically American subjects in a robust, realistic manner, are: "Baseball Player" (1889, Golden Gate Park, San Francisco); "Tired Boxer" (1890, Olympic Club, San Francisco); "Indian Bear Hunt" (1892); "Foot-Ball Players" (1893, University of California); the "Native Sons' Fountain" (1894) and the overexuberant "Mechanics' Fountain," both in San Francisco. Im-

portant among his various public monuments are: the "Commemoration of the Admission of California into the Union"; "California Volunteers of the Spanish-American War"; the memorial to Junipero Serra (San Francisco); and Senator Stephen M. White (Los Angeles). He became a member of the National Sculpture Society. Totally deaf from the age of five, he originated and was vice president of the first International Congress of the Deaf, held in Paris in 1889.

TILDEN, SAMUEL JONES (1814-86). An American lawyer and statesman, born at New Lebanon, N. Y. He attended Yale College and the University of the City of New York, where he graduated in 1837; studied law, and in 1841 was admitted to the bar of New York City. As a lawyer he rose to the first rank. In 1846 he was a member of the State Legislature, in which he devoted his attention particularly to the subject of the State canals, and in the same year served as member of the State Constitutional Convention. In 1867 he once more sat as a delegate to the Constitutional Convention. Having been elected again to a seat in the Legislature, he took the lead in 1872 in impeachment proceedings against Barnard and Cardozo, two of Tweed's corrupt and subservient judges. He helped expose the frauds of the Tweed Ring, having the leading part in the prosecution of its guilty members. By 1868 he had become acknowledged leader of the Democratic party in New York, and his activity in overthrowing the Tweed Ring led to his election in 1874 as Governor of the State. His administration (1875-76) was marked by economy in the management of the State canals. In June, 1876, he was nominated by the Democratic National Convention at St. Louis for President of the United States, and in the ensuing presidential election received a majority of the popular vote, and according to the final count came within one vote of receiving a majority of the electoral vote. Because of alleged frauds in the elections of Louisiana, South Carolina, and Florida, the votes of those States, which were nominally given for the Democratic party and which would have turned the election in Tilden's favor, were claimed by the Republicans, and the excitement which followed threatened to disturb the peace of the country. Finally Congress created an Electoral Commission (q.v.), consisting of five justices of the Supreme Court, five Senators, and five Representatives, to settle the dispute, and by a strict party vote of 8 to 7 it gave its decision in favor of Tilden's opponent, Rutherford B. Hayes (q.v.). Tilden thereupon promptly requested his friends to accept the decision, though many continued to believe and to assert that he had rightfully been elected president. He lived his remaining years in retirement near Yonkers, N. Y. He bequeathed the greater portion of his fortune of about \$5,000,000 to philanthropic purposes, chiefly for the establishment and endowment of a public library in the city of New York. The will was contested and only about \$2,000,000 went to the establishment of the Tilden Foundation of the New York Public Library (q.v.). Consult: John Bigelow, *Life of Samuel J. Tilden* (2 vols., New York, 1895); id., *Letters and Literary Memorials*, edited by John Bigelow (2 vols., ib., 1908); id., *Writings and Speeches*, edited by John Bigelow (2 vols., ib., 1885); also Haworth, *The Disputed Election of 1876* (Cleveland, 1906).

TILDEN, SIR WILLIAM AUGUSTUS (1842–). An English chemist, born in London. He was educated at the Royal College of Chemistry, and served successively as science master, Clifton College (1872–80); professor of chemistry, Mason College (1880–94); and professor of chemistry, Royal College of Science, London (1894–1909). He was president of the Institute of Chemistry in 1899–1903 and of the Chemical Society of London in 1903–05, and in 1908 he received the Davy medal from the Royal Society. In 1909 he was knighted. He published: *Introduction to Chemical Philosophy* (1876); *Practical Chemistry* (1880); *Hints on Teaching Chemistry* (1895); *A Manual of Chemistry* (1896); *A Short History of the Progress of Scientific Chemistry* (1889); *The Elements* (1910).

TILE (AS. *tigol*, *tigele*, from Lat. *tegula*, tile, from *tegere*, to cover). Properly a piece of material for covering a roof, but limited to harder materials than wood. Slate, marble, and other stones which can be cut into thin slabs and resist ordinary breakage have been used for tiles. Ordinary roof tiles are of earthenware and these may be perfectly flat and used to shed the water by being laid over one another on a sloping surface, exactly as shingles are laid. There is also a kind of tile which has a flat and a raised ridgelike convexity cast or molded in the same piece which is known as the pan, or Belgic tile. From the use of the term to cover various kinds of clay products it has come to have two different meanings. First, any flat slab, if small and forming one of many pieces used to cover a large surface, is a tile; second, the different ceramic wares used in building and in all kinds of engineering work, drainage, and the like are called tiles.

The tile floors of the Middle Ages were composed of earthenware tiles, each of which is complete and of one color, or incised with a pattern in such a way that a different-colored clay may be inlaid. In the south of Europe tiles were much used according to a fashion prevalent in the East. In Spain tiles with intaglio patterns filled in with colored glazes were made extensively in the sixteenth and seventeenth centuries. These tiles, unfit for floors, are very decorative when used for the linings of walls. They are known as Cuenca tiles. The Gothic revival in England between 1840 and 1870 brought with it a strong movement to restore these appliances of decorative buildings; and many tile floors were designed and made in medieval taste. In consequence of this the earthenware tile industry became an extensive one in Great Britain and for many years the greater number of tiles imported into the United States came from England. Other tiles have been made with heads, human figures, and groups in slight relief, the ornamentation being obtained by sculpture rather than color.

Clay tiles may be divided broadly into solid and hollow, the former being thin and, except for some roofing tiles, generally flat, while hollow tiles have a great variety of thickness and shape. In the preparation of the clay for molding some one or more of the processes described under CLAY, *Clay Mining and Working*, are employed, varying with the class of clay and the final product. For tile burning, see KILN; TERRA COTTA.

Encaustic Tiles, for floors, walls, and other purposes, are decorative tiles in which the main

body is of one color of clay and a pattern is inlaid in a contrasting color of clay. The term is a mere trade name, without special significance. Unglazed floor tiles in plain colors, the design being made by the combination of tiles of different colors and shapes, are commonly called mosaic tiles. Tiles bearing fixed designs in vitrifiable colors are also sometimes called encaustic tiles. The famous Dutch tiles are simply enameled earthenware, usually in blue, but sometimes in colors, and generally with Scriptural subjects for the design.

Floor Tiles are now made by machinery in metal dies, in which they are subjected to heavy pressure by what is known as the Prosser process. The clay is first prepared as for ordinary ceramic work and then dried again and ground to powder. Wall tiles are made with the back surface broken by undercutting, so the cement may have a better hold. They usually have a highly glazed surface. Floor tiles are generally preferred unglazed. The pattern is produced by the use of brass plates, $\frac{1}{8}$ of an inch thick, or paper stencils, a separate one being used for each color. Thus, for an ornament in red and white on a blue ground, one plate is perforated so as to enable the red portion of the clay powder to be filled in, another is cut for the white portion, and a third for the blue ground, etc. When all are filled up the tile is subjected to great pressure in a screw press and fired as in the ordinary plain tile.

Fireproofing, Structural, or Hollow Tiles are rapidly growing in use (see FIREPROOF CONSTRUCTION), particularly for fitting around steel columns and girders forming partitions, floor arches, and ceilings. Their lightness is greatly in their favor. They are divided into three classes: dense, porous, or terra-cotta lumber, and semiporous. Dense tiles are prepared for molding much like terra cotta. They are given heavy pressure and a long burning, and are sometimes made from fire clay. Porous tiles are made by mixing one part by bulk of soft wood sawdust or finely cut straw with two parts of clay, passing the mixture through a disintegrator or cutter, and then between two sets of corrugated rolls, one below the other. From the rolls conveyors take the mixture to the tile machines described below. The subsequent burning destroys the sawdust or straw, leaving a very porous tile into which nails may be driven, or which may be cut with a saw; hence the name terra-cotta lumber. Semiporous tiles are made of good fire clay containing 60 per cent of silica, calcined fire clay, and coarsely ground bituminous coal. These materials are mixed, molded, and burned much like porous tiles.

Hollow Tile Machines are of various forms according to the character of the clay. The tempered clay is forced through forms and around plugs. The forms give the outer and the plugs the inner shape to the tiles. The plugs are of metal, with their front ends just inside the form. Plungers force the clay over or around the plugs, then through the forms. The continuous shapes are separated by wires or knives. Some of the special forms require partial hand shaping.

Roofing Tiles, when of clay, are something like terra cotta (q.v.) in their composition and manufacture. They are made in various colors and shapes, the shapes being governed largely by the kind of vertical joints employed. In Pennsylvania flat, or Germanic, tiles of un-

glazed red clay, about 15 inches in length with a nib at the back for hanging on a rafter, were made extensively through most of the eighteenth century.

TILEFISH (name coined from penultimate syllable of generic name). A deep-sea fish (*Lopholatilus chamaeleonticeps*) chiefly remarkable for its strange history. It was accidentally discovered in large numbers in 1879 by fishermen trawling for cod south of Nantucket, and was

TILEFISH.

found again in 1880 and 1881. In the spring of 1882 shipmasters reported that an immense area of ocean surface about 300 miles south of Long Island was covered with many millions of floating fish, dead or dying, chiefly tilefish, which showed no marks of injury or disease. Verrill and other ichthyologists, judging by various circumstances, explained this as the result of an incursion of cold water, forced by the heavy northerly gales of that spring, into the warm area of the Gulf Stream.

This fish represents a genus of the family Malacanthidae, which includes several edible fishes of the seas of both sides of tropical America, one of which, the bluntnose or whitefish (*Caulolatilus princeps*), is a well-known food fish of southern California. The tilefish is a large, big-headed, brilliantly colored, active fish, sometimes 40 pounds in weight, but ordinarily from 10 to 20 pounds. It is characterized by a high adipose protuberance upon the nape in advance of the long dorsal fin, and by a short barbel at the angle of the lips on each side. Its flesh was found to be excellent, and the United States Fish Commission made great efforts to learn where it might be found, but the disaster of 1882 seemed to have wholly exterminated the

species. Some 10 years later an occasional one was captured, and investigation of the edge of the continental plateau was resumed by the Fish Commission. It was finally determined that the area of their distribution extends along a band of sea bottom from about 39° N. lat. southward between 69° and 73° W. long. to an unknown distance, in water from 60 to 80 fathoms deep, wherever the water has a temperature not colder than 50° F. Increasing catches were made in 1902 and in succeeding years.

Lucas, in *Annual Report of the United States National Museum for 1889* (ib., 1891); H. C. Bumpus, "The Reappearance of the Tilefish," in *Bulletin of the United States Fish Commission* (ib., 1899).

TILE KOLUP. See HOLZSCHUH.

TILGHMAN, til'mān, MATTHEW (1718-90). An American patriot, born in Queen Anne Co., Md. He was early engaged in the Indian wars, and in 1751 was elected a delegate to the Maryland Assembly, where he sat continuously until the formation of the State government, Feb. 5, 1777, and was Speaker of the House in 1773-75. From 1774 until the establishment of the State government he was president of the convention which exercised the chief authority. He was also head of the Committee of Correspondence of the Council of Safety, and of the delegation to the Continental Congress. He was a strong advocate of independence, but was prevented from signing the Declaration of Independence by being called home to preside over the convention to frame a State constitution. He was an earnest, enthusiastic patriot and did much for the American cause in Maryland.

TILGHMAN, TENCH (1744-86). An American soldier, born near Easton, Md. Prior to the Revolution he was engaged in mercantile pursuits at Philadelphia, but early in 1775 entered the American army as lieutenant in an infantry company, and in July was sent as a special commissioner to treat with the Iroquois. From August, 1776, until the close of the war, he was an aide and military secretary of General Washington, participating in all the battles of the main army during this period; and in October, 1781, carried to Congress the news of Cornwallis' surrender, covering the distance from Yorktown to Philadelphia in four days. In May, 1781, he was made a lieutenant colonel, to take rank from April 1, 1777, and in October, 1781, Congress voted him "a horse properly caparisoned and an elegant sword, in testimony of their high opinion of his merit and ability." After the war he removed to Baltimore, where he died. Consult *Memoir of Tench Tilghman* (Albany, 1876).

TILGNER, tīl'k'nēr, VIKTOR (1844-96). An Austrian sculptor. He was born in Pressburg, and studied under Franz Bauer and Joseph Gasser at the Vienna Academy. He was later influenced in favor of the baroque and rococo styles by the French sculptor Deloye, and at the Exposition of 1873 attracted much attention with his bust of the actress Charlotte Wolter. This was the first of a series of remarkably spontaneous and individual portraits, which include the statue of Emperor Francis Joseph and the busts of Crown Prince Rudolf, Hans Makart,

Liszt, and Rubens (Künstlerhaus, Vienna). His strong sense of the decorative later found expression in such vital and attractive works as fountain groups for the Imperial villas at Ischl and in the Volksgarten and the Tiergarten near Vienna, the heroic-sized figure of "Falstaff" (Burgtheater, Vienna), and a number of successful polychrome busts and genre statuettes. In his monuments, such as those to Hummel at Pressburg, to Wernle at Steyr, and to Mozart (1896) at Vienna, he combined baroque extravagance with a thoroughly naturalistic treatment.

TILIA/CEÆ (Neo-Lat. nom. pl., from Lat. *tiliaceus*, relating to the linden, from *tilia*, linden tree, Gk. *πτελέα*, *ptelea*, Arm. *tehi*, elm). **THE LINDEN FAMILY.** A family of dicotyledonous trees, shrubs, and rarely herbs, including about 35 genera and 275 species, widely distributed in warm and tropical regions, a few occurring in the temperate zones. The representative of the family in the north temperate zone is *Tilia*, with about 20 species, which are trees variously known as linden and basswood. The Tiliaceæ yield valuable light timber (see GREWIA), jute or corchorus (q.v.), and other fibres.

TILL. The unstratified deposit of clay, boulders, and more or less sand that lies upon bed rock in the region covered by the Pleistocene ice sheet. It is also called boulder clay. See GLACIAL PERIOD.

TILLAGE (from *till*, AS. *tilian*, *teolian*, OHG. *zilon*, *zilen*, Ger. *zielen*, to aim, strive for). The process of stirring and mixing the soil for the purpose of increasing its productiveness. The operations of plowing, harrowing, spading, hoeing, etc., constitute tillage. There are three distinct classes of tillage: (1) surface tillage brought about by such implements as plows, harrows, cultivators, and weeders; (2) sub-tillage, such as is secured by use of subsoil plows and other deep-tillage implements; and (3) intertillage, such as is carried on while the soil is occupied by a crop. Pulverizing the soil by tillage not only favors the root growth of plants but improves the moisture and other physical conditions of the soil, checks evaporation, promotes weathering and disintegration, which set plant food free, supplies conditions favorable to the activity of beneficial organisms in the soil (nitrification, q.v.), and destroys weeds (and in many cases injurious insects). Deep tilth of soil is generally desirable, but should as a rule be brought about gradually. See PLOW, PLOWING.

TILLAMOOK. See SALISHAN STOCK.

TILLEMONT, tɛl'mɔ̃n', SÉBASTIEN LE NAIN DE (1637-98). A French ecclesiastical historian, born in Paris. He was educated at Port Royal, under the Jansenist influence, and was ordained a priest in 1676. In 1681 Tillemont made a visit to Holland and Flanders, for the purpose of seeing Arnould and other Jansenist refugees. He had worked meanwhile on his Church history. To avoid the opposition of the censor, he separated from the Church history the history of the emperors, which he was enabled to print as a distinct work, without referring it to the censorship, under the title *Histoire des empereurs*, etc. (1691-1738). In 1693 the first volume of the Church history appeared under the title *Mémoires pour servir à l'histoire ecclésiastique des six premiers siècles*, complete in 16 volumes (1693-1712). The *Histoire des empereurs* com-

prises all the reigns from Augustus to Anastasius (518); the *Histoire ecclésiastique* comes down to about the same period. Both are laborious compilations from the original writers. He was also author of *Vie de Saint-Louis* (new ed., 1847-51).

TIL/LETT, BEN (JAMIN) (1859-). An English labor leader and Socialist, born at Lower Easton, Bristol. As a boy he worked in coal pits and brickyards until he was 14 years old, and then went to sea, spending three years in the merchant service and two in the navy. While working as a tea cooper he came in contact with the dock and wharf work, and in 1887 was active in organizing the Tea Coopers' and General Laborers' Association. Later he succeeded in forming the Dock, Wharf, and General Workers' Union of Great Britain and Ireland, of which he was thereafter general secretary, and with Tom Mann (q.v.) he led the Great Dock Strike of 1888. For many years he was an alderman in the London County Council, and he contested seats for Parliament in 1892, 1895, 1906, and 1910. In 1915 he visited the British battle front in France, and upon his return urged the working class to increased efforts to supply the needs of the soldiers. He wrote *Trades Unions and Socialism* (1894) and *History of the London Transport Workers' Strike, 1911* (1912).

TILLET, WILBUR FISK (1854-). An American Methodist clergyman and educator, born at Henderson, N. C. He graduated from Randolph Macon College in 1877 and from Princeton Theological Seminary in 1880. He entered the ministry of the Methodist Episcopal Church South in 1881. In Vanderbilt University he was professor of systematic theology and dean of the theological faculty after 1884 and vice chancellor after 1886. He published *Personal Salvation* (1902; Span. trans.); *A Statement of the Faith: World Wide Methodism* (1906); *Hymns and Hymnwriters of the Church* (1911), with C. S. Nutter.

TILL/MAN, BENJAMIN RYAN (1847-1918). An American politician, born in Edgefield Co., S. C. He was educated at Bethany Academy, became a planter, and interested himself in the development of industrial and technical education in South Carolina. He became the recognized leader of the farming element in the Democratic party in South Carolina, received the support of the Farmers' Alliance, and in 1890, as the Democratic candidate, was elected Governor of the State. He was reelected in 1892, and secured the passage of a law providing for the dispensary system of selling liquor under State control. In 1894 he was elected United States Senator, being reelected to that office in 1900, 1906, and 1912. His speeches against President Cleveland in 1895-96 in the Senate won him the name of "Pitchfork" Tillman. He was active in both free-silver campaigns, in 1896 and 1900, as one of the most radical supporters of the candidacy of W. J. Bryan. An assault which he made on his colleague, J. L. McLaurin, in the Senate, Feb. 22, 1902, led to the censure of both by that body. From 1912 he was a member of the Democratic National Committee.

TIL/LO, ALEXEI ANDREYEVITCH (1839-1900). A Russian general and scientist, distinguished for his work in geodesy, meteorology, terrestrial magnetism, hypsometry. He was born at Kiev and was a student, then an officer, in Russian

military schools. He studied at the Astronomical Observatory at Pulkova, receiving a thorough training in geodesy under Struve and Doellen, and it was chiefly through his efforts that the Imperial Department of Agriculture organized expeditions to study the sources of the principal Russian rivers. His elaborate investigations and careful computations of isobaric, magnetic, and locational elements won him a European reputation, and his works include atlases of isobars of Russia and Asia, of distribution of magnetic lines and catalogues of latitudes and longitudes.

TILLODONTIA, til'lo-dôn'shî-à (Neo-Lat. nom. pl., from Gk. *τίλλειν*, *tilleîn*, to pluck, tear + *ὀδούς*, *odous*, tooth). An extinct sub-order of early Tertiary fossil mammals supposed to be ancestral to the modern rodents. The principal genera, *Esthonyx*, *Tillotherium*, *Stylinodon*, *Dryptodon*, and *Anchippodus*, are found in the Eocene and Miocene beds of the western United States. See **RODENTIA**.

TILLOTSON, JOHN (1630-94). Archbishop of Canterbury. He was born in Sowerby, in Yorkshire, in 1630, the son of a clothier, who was a zealous Independent. He was educated at Clare Hall, Cambridge. He was a preacher in 1661—attached apparently to the Presbyterian party in the Church of England, for at the Savoy conference (q.v.) he was present as an auditor on the Presbyterian side; but he submitted at once to the Act of Uniformity (1662), and in 1663 he was appointed to the rectory of Kedington in Suffolk, and almost immediately after was chosen preacher at Lincoln's Inn. In 1666 he published *The Rule of Faith*, in reply to a work by an English clergyman named Sargeant, who had gone over to the Roman Catholic church. He was made a prebendary of Canterbury in 1670 and dean in 1672. With Burnet he attended Lord Russell during his imprisonment for complicity in the Rye House Plot, and on the accession of William III rose high into favor. In March, 1689, he was appointed clerk of the closet to the King; in November, made dean of St. Paul's; and in April, 1691, was raised to the see of Canterbury, vacant by the deposition of Sancroft (q.v.), after vainly imploring William to spare him an honor which he foreboded would bring him no peace. Nor was he mistaken in his painful presentiment. The nonjuring party pursued him to the end of his life; but he bore their animosity without complaint or attempt at retaliation. A collected edition of his *Sermons*, in 14 volumes, was published after his death by his chaplain, Dr. Barker (London, 1694), and has been frequently reprinted. The best edition of his sermons and other works is by Dr. T. Birch, who also wrote his *Life* (London, 1752).

TILLY, JOHANN TSERKLAES, COUNT OF (1559-1632). A Catholic general in the Thirty Years' War, born at the Castle of Tilly, in Brabant. He received his military training in the Spanish armies, fought against the Turks in Hungary, and in 1610 was selected by Duke Maximilian of Bavaria to reorganize his army. At the outbreak of the Thirty Years' War (q.v.) he was placed in command of the forces of the Catholic League and on Nov. 8, 1620, won the battle of the White Hill, near Prague, which put an end to the short reign of Frederick of the Palatinate in Bohemia. He then carried on the struggle in the Palatinate, was defeated by Mansfeld and the Margrave of Baden-Durlach at

Wiesloch (April 27, 1622), but gained a decisive victory over the latter at Wimpfen (May 6), and defeated Christian of Brunswick at Höchst (1622) and Stadtlohn (1623). For these services he was created Count of the Empire. He defeated Christian IV of Denmark at Lutter (Aug. 27, 1626), and cooperated with Wallenstein in bringing about the complete triumph of the Catholics in this second phase of the Thirty Years' War. When the influence of the League secured Wallenstein's retirement (1630), Tilly succeeded to the command of the Imperial forces, and took by storm the town of Magdeburg (May 20, 1631). The atrocities which the Croats and Walloons of his army perpetrated on this occasion form a stain upon a character that was remarkable in that age for honesty and loyalty to conviction. The capture of Magdeburg was Tilly's last triumph. Gustavus Adolphus completely routed him at Breitenfeld (Sept. 17, 1631). In April, 1632, the Swedish King forced the passage of the river Lech in Tilly's front after a desperate conflict, in which Tilly was mortally wounded. He was removed to Ingolstadt, where he died. Consult: Villermont, *Tilly* (Tournay, 1859); Klopp, *Tilly im Dreissigjährigen Kriege* (Stuttgart, 1861), both written from the Catholic point of view; and Wittich, *Magdeburg, Gustav Adolf und Tilly* (Berlin, 1874).

TIL'SIT. A town of Prussia, in the Province of east Prussia, on the left bank of the Memel or Niemen, 61 miles northeast of Königsberg (Map: Germany, J 1). It stands in a fruitful district, has broad streets, a cleanly appearance, and has paper, sugar, and oil mills, iron foundries, machine shops, distilleries, chemical establishments, breweries, and shoddy mills. It also gives its name to a pungent and popular cheese. Pop., 1900, 34,539; 1910, 39,013.

At Tilsit, on a raft in the middle of the Niemen, occurred, June 25, 1807, the celebrated meeting between Napoleon and Alexander I of Russia, following the defeat of the Russian forces at Friedland (q.v.). On July 7 peace was concluded at Tilsit between France and Russia and on the ninth between France and Prussia. The latter was stripped of her possessions west of the Elbe and of the Polish territories acquired in 1793-95, out of which Napoleon created the Duchy of Warsaw. Danzig was made a free city. Prussia joined the Continental System and closed its ports to English vessels. Its army was reduced to 42,000 men, and until the payment of a heavy indemnity a number of the chief strongholds were to remain in the hands of the French. A secret agreement between France and Russia provided for the imposition by force of the Continental System on Portugal, Austria, and the Scandinavian countries. Practically at Tilsit the French and Russian monarchs divided between them the mastery in Europe, France remaining the arbiter in west and central Europe, while Russia was given a free hand in Sweden and Turkey. Tilsit was occupied but later evacuated by the Russians in the Great War which began in 1914. See **WAR IN EUROPE**.

TIL'TON, JAMES (1745-1822). An American physician and army surgeon, born in Kent Co., Del. He studied at the University of Pennsylvania (M.D., 1771). He entered the Colonial army in 1775 as first lieutenant, becoming surgeon in 1776 and resigning in 1782 as senior hospital physician and surgeon. In 1780 Doctor

Tilton introduced with the best results a system of log hospital huts admitting free ventilation, and each accommodating only six patients. From 1783 to 1785 he was a delegate to the Continental Congress. As surgeon-general in the War of 1812, Tilton greatly improved the government medical service. He practiced first at Dover and later at Wilmington, Del.

TILTON, THEODORE (1835-1907). An American journalist, poet, and novelist, born in New York. He graduated at the College of the City of New York in 1855, and was an editor of *The Independent* for most of the years between 1856 and 1871, and of *The Golden Age* (1871-74). In 1874 he brought criminal charges against the Rev. Henry Ward Beecher (q.v.), whom he accused of improper relations with his wife. Afterward he attracted attention as a platform speaker, chiefly in behalf of woman's rights. After 1888 he lived in Paris. His books include: *The Seaton's Tale and Other Poems* (1867); *Sancta Sanctorum, or Proof Sheets from an Editor's Table* (1869); *Tempest-Tossed*, a romance (1873); *Thou and I*, verses (1880); *Swabian Stories*, ballads (1882); *The Chameleon's Dish* (1883) and *Heart's Ease* (1894), volumes of verse; and *The Fading of the Mayflower: A Poem* (1906). His *Complete Poetical Works* appeared in 1897.

TIL WOOD. See OREODAPHNE.

TIMÆ'US (Lat., from Gk. *Tīmaios*, *Timaïos*) (c.352-256 B.C.). A Greek historian, son of Andromachus, tyrant of Tauromenium, in Sicily. He was banished from Sicily by Agathocles, and passed most of his life in Athens. His chief work, a *History of Sicily* in 68, or, according to others, 38 books, embraced the period from the earliest times to 264 B.C. Polybius and others, notably Diodorus Siculus, pronounce him unfit for writing history on account of his "lack of critical acumen, malignity, and tendency to superstition." But, although most of these charges are founded on truth, Timæus's deficiencies have probably been exaggerated, since modern critics and most of the ancients praise his general knowledge and his accuracy in indicating the chronology of the events which he describes. He is said to have introduced the practice of recording events by Olympiads. Consult: Müller, *Fragmenta Historicorum Græcorum* (Paris, 1841); F. Susemihl, *Geschichte der griechischen Literatur in der Alexandrinerzeit*, vol. i (Munich, 1891); J. B. Bury, *The Ancient Greek Historians* (New York, 1909); Christ-Schmid, *Geschichte der griechischen Literatur*, vol. ii, part i (5th ed., Munich, 1911).

TIMARU, tē'mā-rōō; *collog.* tim'a-rōō. A seaport and agricultural port of entry on the main railway line between Christchurch and Dunedin, South Island of New Zealand (Map: New Zealand, S. I., C 5). It is the junction of the branch line by which tourists proceed to the alpine regions around Mount Cook. Flour and woolen mills and frozen-meat works are the chief industries. A concrete breakwater has made an efficient harbor at Timaru. Pop., 1911, 7927.

TIMBER (AS. *timber*, OHG. *zimbar*, timber work, room, Ger. *Zimmer*, room). In law, such trees as are suitable for building purposes. Timber trees belong to the owner of the land, both when standing and fallen, unless converted into lumber in a convenient form for transportation. Therefore timber will pass with the land under a conveyance, and is included in a

mortgage on the land without being specifically mentioned. A sale of standing timber, the terms of which indicate an intention to pass title thereto at once, is considered a sale of realty, and must consequently be in writing to satisfy the Statute of Frauds; but if the title is not to pass until severance, the transaction is viewed as the sale of a chattel merely. A tenant is not legally entitled to cut more timber than is necessary for the purposes for which he hired the land, unless under special agreement. The term "timber" is also applied to large pieces of lumber suitable for the framework of buildings, bridges, etc., as distinguished from shingles, lath, etc. See REAL ESTATE.

TIMBER. See LUMBER INDUSTRY.

TIMBER AND TIMBER SUPPLY. See LUMBER INDUSTRY.

TIMBERING. See MINING.

TIMBER PRESERVATION. See FORESTRY.

TIMBRE, tim'bēr. See CLANG TINT, EXPLANATION OF.

TIMBREL (derivation uncertain). An ancient musical instrument like a tambourine (q.v.), a tabor. In architecture, the same as tympanum (q.v.), but this use of the term is very rare.

TIMBUKTU, tim-buk'tōō, or **TIMBUCTOO**.

A town in the Timbuktu District of the Military Territory of the Niger, French West Africa, 9 miles north of the Niger (Map: Africa, D 3). The climate is unhealthy. The town, near the southern borders of the Sahara Desert, lies between a rolling table-land on the north and the swamps of the Niger. It has flat, windowless clay houses. It was largely in ruins when taken by the French. They have, however, introduced improvements, and new streets and European churches and schools have been constructed. Timbuktu is fortified. There is also a fortress at Kabara on the Niger. There are two important and handsome mosques. Timbuktu is notable for its commerce, and is the focus of the caravan trade in West-Central Africa. The annual value of the transit trade alone is put at \$4,000,000. Gums and rubber are perhaps the leading articles. Gold, ivory, wax, salt, hardware, beads, and cheap cloth are also prominent items. The trade is chiefly by barter. The few local manufactures include cottons, leather articles, and pottery. French goods and money are replacing those of other countries. Timbuktu is a centre of Mohammedan learning and has a large Moslem library. The population, which has greatly diminished in recent times, is 5107. The town was founded in 1077 by the Tuareg tribe. It passed through different hands, began to be a place of commercial importance in the sixteenth century, and was seized by an army from Morocco in 1591. The Fulahs drove out the Moors early in the nineteenth century. Timbuktu was first visited by a European in 1826—Major Laing, an Englishman. From 1844 to 1846 it was again in the hands of the Tuaregs. In 1863 Ahmed el-Bathai drove out the Fulahs for the last time. The town passed into the possession of the French in 1894. Consult: Oskar Lenz, *Timbuktu* (2 vols., Leipzig, 1892); Félix Dubois, *Timbuctoo the Mysterious* (London, 1896); Toutée, *Du Dahomé au Sahara* (Paris, 1899); Lugard, *A Tropical Dependency* (London, 1905).

TIM'BY, THEODORE RUGGLES (1822-1909). An American inventor, born in Dover, N. Y. In 1841 he prepared a model of a revolving battery

which he submitted to the military authorities in Washington, and from which he subsequently developed a metallic revolving fort to be used on land and water, and for this in 1862 he obtained a patent for a revolving tower for defensive and offensive warfare. In consequence of this patent he received a royalty of \$5000 in 1862 for each turret constructed by the builders of the *Monitor*. His other inventions include a method for firing heavy guns by electricity (1861); a cordon of revolving towers across a channel (1862); a mole and tower system of defense (1880); a subterranean system of defense (1881); and a revolving tower and shield system (1884), for all of which he obtained patents.

TIME (AS. *tima*; connected with *tīd*, OHG. *zit*, Ger. *Zeit*, time, Eng. *tide*, Skt. *a-diti*, boundless). In philosophy there has been even more difference of opinion as to the nature of time than of space (q.v.). In addition to the views of time which parallel those of space, there are still others about time on the part of thinkers who regard time as more fundamental than space in the constitution of the world. This way of regarding time as more real than space is almost inevitable in idealism (q.v.), and was taken by the first great idealist in modern philosophy, Bishop Berkeley. If the whole material world is nothing but ideas in minds, and if minds are conceived as immaterial and as not having spatial extension, it seems to follow that the apparent space in which the material world exists, being in a spaceless mind, cannot itself be what it seems. Thus Berkeley came to the conclusion, reinforced by considerations drawn from an associational psychology, that "neither distance nor things placed at a distance are themselves, or their ideas, truly perceived by sight . . . what he (any one) sees only suggests to his understanding that, after having passed a certain distance, to be measured by the motion of his body, which is perceivable by touch, he shall come to perceive such and such tangible ideas, which have been usually connected with such and such visible ideas." "As we see distance so we see magnitude. And we see both in the same way that we see shame or anger in the looks of a man. Those passions are themselves invisible." In the last analysis space is resolved into time with its suggestions. Ideas being in the mind are indeed in time, but not in space. But this time is not an independent entity; it is "*nothing*, abstracted from the succession of ideas in our minds," and it follows "that the duration of any finite spirit must be estimated by the number of ideas or actions succeeding each other in that same spirit or mind." When we say, then, that ideas are in time, we should not mean that they are contained in some medium which has an independent existence, but that they follow each other, and that the fact of this sequence is itself time. This position taken by Berkeley was one of unstable equilibrium, and subsequent idealists have endeavored in various ways to maintain a more secure poise. Some, like T. H. Green, have practically denied the ultimate reality of time altogether; consciousness, for which alone there is reality, is "an agent for the neutralization of time." This is the most common way of dealing with the difficulty, and results in the doctrine of the timeless Absolute. Another way out of the difficulty is taken by Josiah Royce, who makes time a fundamental character of the real world as experienced by the

Absolute; the difference of before and after for the Absolute is just the same as that of before and after for us within the small span of the specious present. Just as we can hear at the same time several successive taps and experience their successive within the same moment, so the Absolute within his all-comprehensive span experiences immediately all the past and all the future at once, without, however, failing to experience their relative priority and posteriority. There is nothing future or past to his experience, but things are future or past to *one another* for his experience. Time is thus ultimately real. Royce claims that this is a justifiable extension to the Absolute Experience of what is an empirical fact in our finite experience; he has been criticized for failing to note that what makes temporal priority or posteriority in our experience is the order in which events *enter into* this experience: as into the Absolute Experience nothing *enters*, it is claimed that nothing can be experienced therein as temporal. For the Absolute the time order would not be essentially different from the space order or some other type of static order. This is a serious objection to any attempt to combine the reality of time with an idealistic absolutism.

Apart from idealistic interpretations, recent discussions of time have taken their departure from James's or Bergson's views. In his *Principles of Psychology*, James developed the thesis that "the sensible present has duration." "In short, the practically cognized present is no knife-edge, but a saddleback, with a certain breadth of its own on which we sit perched, and from which we look in two directions into time. The unit of composition of our perception of time is a duration, with a bow and a stern, as it were—a rearward and a forward looking end. It is only as parts of this duration block that the relation of succession of one end to the other is perceived. We do not first feel one end and then feel the other after it, and from the perception of the succession infer an interval of time between, but we seem to feel the interval of time as a whole, with its two ends embedded in it. The experience is from the outset a synthetic datum, not a simple one; and to sensible perception its elements are inseparable, although attention looking back may easily decompose the experience, and distinguish its beginning from its end. As we have seen, Royce infinitizes this specious present and gets the absolute experience, for which the whole future is as real as the whole past. James, on the contrary, insists on the *growth* of time; the future is not yet, not even for an absolute. Time "grows by finite buds or drops, either nothing coming at all, or certain units of amount bursting into being 'at a stroke.'" Real processes of change are not continuous but take place "by finite not infinitesimal steps, like the successive drops by which a cask of water is filled, when whole drops fall into it at once or nothing." This view, like Berkeley's, is in unstable equilibrium. If one emphasizes the durational character of the specious present with past and future included in it, one moves in one direction; if one emphasizes the discontinuous accretions of finite amounts of time, one moves in another. The former direction leads to the view of time as a continuum: the latter to time as a discrete somewhat. This latter view has been developed by Lovejoy.

James leaves no doubt as to his belief that

the future is not yet real; but he is not equally clear about the past, although it would seem that the past also is on his view no longer real. Here Bergson parts company with James. The past is not left behind; it is not differentiated from the present by its status, but by its lesser efficacy. Time is likened to a snowball which, as it rolls onward, carries the snow over which it has traveled along with it. In reality the past is preserved by itself, automatically. In its entirety, probably, it follows us at every instant; all that we have felt, thought, and willed from our earliest infancy is there, leaning over the present which is about to join it, pressing against the portals of consciousness that would fain leave it outside.

While both the Bergsonian and the Jamesian doctrines of time claim to be purely empirical, and not based upon dialectical considerations, it is also claimed for them by their authors that they obviate the dialectical difficulties that have been raised against the reality of time. These difficulties are the Zenonian paradoxes. Zeno (q.v.) himself was probably arguing against the view of the discontinuity of time, but the recent philosophers who have made use of his arguments have turned them against the doctrine of the continuity of time. It is urged that if time is continuous in the sense that it is infinitely divisible, as there must be an infinity of points on a line of any length, it would take a correspondingly infinite number of moments to traverse all these points. But an infinite number of moments would be infinite time; but if it would take an infinite time to accomplish any result, the result could never be accomplished. As James states the argument, "That Achilles should occupy in succession all the points in a single continuous inch of space, is as inadmissible a conception as that he should count the series of whole numbers 1, 2, 3, 4, etc., to infinity and reach an end." Bergson returns again and again to the difficulties involved in such a view of time, and alleged to be insurmountable. But it would seem that the difficulty is factitious. One way of meeting the difficulty has been to say that if an inch of space be conceived as containing an infinite number of points, a minute of time can by a similar treatment be conceived as containing an infinite number of instants; and whatever instant be taken as correlated with any point, a last instant can be conceived as correlated with the last point, and when this instant is reached the line is traversed. Against this reply it is urged that the difficulty is not met by doubling it. An infinite number of instants of time cannot elapse any more than an infinite number of points can be traversed. Or as James puts it, the puzzle is not so much one involved in motion as in the flight of time itself. Unless time is composed of a finite number of indivisible moments, no smallest length of time can run its course until the infinite number of its constituent instants has been summated, i.e., it can never happen.

Argument upon such a basis is sophistical. The continuity of time does not mean that it is composed or aggregated out of an infinity of moments, but that any length of time is capable of being divided into any number you please of smaller lengths. Any division you make is a finite division; to say that the divisibility of time is infinite is not to say that time is actually infinitely divided, but that it *may* be divided

as much as you please. But however much divided, the division actually made is always finite; the parts are of finite length, and a definite number of these definite parts makes up the total length you started to divide up. Any part of time you choose is always some length of time, and time is not composed of lengthless elements. In other words, if instant be defined as the temporal correlate of the spatial point, which has no length, breadth, or thickness, and thus is conceived as having no durational length, it is not a part of time. It is the termination of a length of time. It is the boundary between two adjacent lengths, but is a lengthless boundary. A length of time, then, say a minute, is not made up of an infinite number of lengthless instants, but is divisible into any number of correspondingly smaller lengths of duration, each terminating at the lengthless instant at which the next begins. If the passage of time be represented by spatial analogies, it may be illustrated, not by a *point* traversing a line composed of an infinite number of points, but by a short *line* traversing a longer line—a process which does not involve the perplexity in question. Such an illustration is more in keeping with James's own description of the "specious present" previously quoted; but this description must be amended in one point. Instead of saying that we "do not first feel one end and then feel the other after it, and from the perception infer an interval of time between," we should say that while both the prior and the posterior parts of the contents included in the span of the present are both felt together, we came first to feel the prior and then the posterior, just as, when a short line is traversing a longer, the part of the longer which is towards the rear of the moving line is as much spanned by the latter as is the part which is towards its front, and yet the former part entered into that span before the latter part. It was this failure to reckon both with the *entrance* of elements into the span of the present and with their *inclusion* within this span, that has led both James and Royce to their vagarious treatment of time, one in the case of the finite experience and the other in the case of the assumed Eternal Experience.

In its legal aspect, the meridian of the sun is the generally recognized standard of time; but where persons enter into legal relations expressly with reference to some arbitrary system, as that adopted by railroads for their convenience, the courts will apply the standard contemplated by the parties in case of a controversy. In computing a period of time from a certain day, the general rule is to exclude the first day and include the last day of the count. This rule may be disregarded if it will best effectuate the intention of the parties to an agreement. It is generally held that a policy of insurance includes the last day of the period named therein. In many States Sunday, or other dies non, is included in the computation of a number of days if they exceed a week, i.e., seven days, but excluded if less than seven days. In some States a dies non is included unless it would be the last day of a period. See DIES NON; MONTH; DAY.

In music, time is the division of a measure into the fractional parts of a whole note. The sign which indicates the character of the subdivision, and which consequently regulates the rhythm of the movement, is called the time

signature. This is generally a fraction ($\frac{2}{4}$, $\frac{3}{8}$, $\frac{4}{8}$, etc.) placed after the clef at the beginning of a movement. In the fraction the lower figures represent the kind of notes to be used as time standards, while the upper figure shows how many of them are to be given in a bar. There are two general classes of time, duple and triple; in the former, the number of beats in a bar is divisible by two; in the latter, by three. Common time, so called, is $\frac{4}{4}$ and is represented by the sign C. Compound duple time and compound triple time differ only from their originals in that each beat (containing a dotted note or its equivalent) is divisible by three. See RHYTHM; TEMPO.

Boodin, *Time and Reality* (ib., 1904); James Arthur, *Time and its Measurements* (Chicago, 1909); Henri Bergson, *Time and Free Will*, Eng. trans. by F. L. Pogson (ib., 1910); Lovejoy, "The Problem of Time in Recent French Philosophy," in *The Philosophical Review* (Boston, 1912); McGilvary, "Time and the Experience of Time," in *The Philosophical Review* (ib., 1914); and the bibliography in the article SPACE.

TIME, EQUATION OF. See EQUATION OF TIME; NAVIGATION.

TIME, RECKONING OF. See DAY; HOUR; INTERNATIONAL DATE LINE; MONTH; TIME, STANDARD; YEAR.

TIME, STANDARD. The time in common use

of no consequence for our present purpose, when that celestial body is on the meridian of any place we call the time at that place noon, or 12 o'clock. (See EQUATION OF TIME.) It follows that when it is noon at any given place it is similarly noon at all other places having the same meridian, and at places having different meridian it is either forenoon or afternoon. In fact, as the sun rises in the east and sets in the west, it is evident that when it is crossing the meridian of any place it must have already passed that of neighboring places to the eastward, and not yet have reached that of neighboring places to the westward. In other words, when it is noon in the given place it is already afternoon in places to the eastward, and still forenoon in places to the westward. The farther east one travels, the later is the local time; and this gives rise to the rather perplexing time differences so familiar to travelers.

In the case of railroads this matter of time differences has caused especially confusing complications. It was formerly customary for a road to use throughout large sections of its territory the local time of one of the principal cities through which it passed. The result was that when two railroads met in some smaller town, it happened not infrequently that they were running under widely different time systems. As many as five different kinds of time have been thus simultaneously in use in a single town.

TABLE OF THE WORLD'S TIME STANDARDS

COUNTRIES	Central meridian	Fast or slow on Greenwich
Great Britain, Faroe Islands, France, Belgium, Spain, Portugal, Gibraltar, Algeria, Morocco, Upper Senegal-Niger, Ivory Coast, Dahomey, Togoland, São Thome and Príncipe Islands	0°	0 h.
Norway, Sweden, Denmark, Luxemburg, Germany, Austria-Hungary, Switzerland, Italy, Malta, Montenegro, Bosnia, Tunis, French Equatorial Africa, Cameroons, Belgian Congo, Angola, German Southwest Africa	15° E.	1 h. fast
Rumania, Bulgaria, Turkey (railways), Egypt, German East Africa, Mozambique, British South Africa	30° E.	2 h. fast
Uganda, British East Africa	37½° E.	2½ h. fast
Aden, Somaliland, Madagascar	45° E.	3 h. fast
Mauritius, Seychelles, Réunion	60° E.	4 h. fast
Chagos Archipelago, Portuguese India	75° E.	5 h. fast
India (Bombay, Madras), Ceylon, French India	82½° E.	5½ h. fast
India (Calcutta)	90° E.	6 h. fast
Burma	97½° E.	6½ h. fast
Straits Settlements, Indo-China	105° E.	7 h. fast
Hongkong, Macao, Eastern China, Formosa, Philippines, British Borneo, Labuan, Portuguese Timor, West Australia	120° E.	8 h. fast
Japan, Korea	135° E.	9 h. fast
Guam, Northern Territory, South Australia	142½° E.	9½ h. fast
Queensland, New South Wales, Victoria, Tasmania, German New Guinea	150° E.	10 h. fast
New Caledonia, New Hebrides	165° E.	11 h. fast
New Zealand	172½° E.	11½ h. fast
Iceland, Madeira, Senegal, Portuguese Guinea, French Guinea, Sierra Leone	15° W.	1 h. slow
Cape Verde Islands, Azores, Fernando da Noronha, Trinidad (Brazilian)	30° W.	2 h. slow
Eastern Brazil	45° W.	3 h. slow
Prince Edward Island, Nova Scotia, Sainte-Pierre and Miquelon, Porto Rico, Lesser Antilles, French Guiana, British Guiana, Amazonas (Brazil)	60° W.	4 h. slow
New Brunswick, Quebec, Eastern Ontario, Eastern United States, Bahamas, Jamaica, Canal Zone, Peru, Acre (Brazil), Chile	75° W.	5 h. slow
Western Ontario, Manitoba, Central United States, Honduras, British Honduras	90° W.	6 h. slow
Saskatchewan, Alberta, Mountain United States	105° W.	7 h. slow
British Columbia, Pacific United States	120° W.	8 h. slow
Alaska, Yukon	135° W.	9 h. slow
Tahiti	150° W.	10 h. slow
Hawaii	167½° W.	10½ h. slow
Samoa	172½° W.	11½ h. slow

for regulating the ordinary affairs of life. It is derived from the sun. Leaving out of account small irregularities of the solar motion that are

The establishment of an international standard of time appears to have been first suggested by Charles Dowd, of Saratoga Springs, in 1870.

In 1879 the question was raised anew by Mr. (afterward Sir) Sandford Fleming (q.v.), chief engineer of the Canadian Pacific Railway, and through his efforts was brought to the attention of the leading governments of the world, with the result that in 1882 the United States Congress passed a joint resolution authorizing the President to call an international conference to fix and recommend for universal adoption a common prime meridian to be used in reckoning longitude, and in the regulation of time throughout the world. The conference assembled in Washington, Oct. 1, 1884. Delegates representing 26 countries were present, but they were not able to agree unanimously upon a prime meridian. However, most of them favored the adoption of Greenwich, England, as the origin of longitudes. The French delegates represented the only important nation that would not agree, and it was not until March 10, 1911, that France abandoned the use of the meridian of Paris and adopted that of Greenwich as its prime meridian.

When the Prime Meridian Conference met, the United States and Canada had already selected a series of standard meridians, differing in longitude from that of Greenwich, England, by exact multiples of 15°. On Oct. 18, 1883, a convention was called by W. F. Allen, Secretary of the General Railway Time Convention, which decided on the introduction of standard time to take effect at noon on Nov. 18, 1883, and the change was made without difficulty. Now 15° of longitude corresponds exactly to one hour of time difference, and therefore the local times of the several standard meridians differ from Greenwich by an even number of hours without fractional minutes and seconds. In the United States the standard time meridians are those whose longitudes are west of Greenwich 60°, 75°, 90°, 105°, and 120°. The times of these meridians are respectively 4 hours, 5 hours, 6 hours, 7 hours, and 8 hours slow on Greenwich time. The time of the 60th meridian is called Colonial, that of the 75th meridian Eastern, that of the 90th Central, that of the 105th Mountain, and that of the 120th Pacific time. The limiting lines of the time zones have been so drawn arbitrarily that they never divide any town. Where such a division is theoretically unavoidable, the dividing line for actual use is drawn on the map with a crook in it, so as to put the whole town on one side of the line.

Most of the countries throughout the world now use standard time based on one of the even hour meridians as reckoned from Greenwich. In a few cases, however, it is found more convenient to use the even half-hour meridians. Belgium and Holland were the first continental nations to follow the example of the United States in introducing the zone system, and other countries fell rapidly into line. (Brazil established four time zones in 1913.) Of the countries of Europe, only Ireland, Holland, Russia, and Greece hold aloof, and base their time systems on the meridians of their respective capitals (except in the case of Russia, where Pulkowa time is used on the railways), Holland having abandoned the meridian of Greenwich for that of Amsterdam on May 1, 1909.

Consult: Harold Jacoby, *Practical Talks by an Astronomer* (New York, 1902); W. F. Allen, *Short History of Standard Time* (Philadelphia, 1904); H. H. S. Cunynghame, *Time Clocks* (New York, 1906). See CLOCK; DAY; HOROLOGY; INTERNATIONAL DATE LINE; MONTH; TIME SIGNALS.

TIM'ELI'DÆ (Neo-Lat. nom. pl., from *Timelia*, from the East Indian name). An assemblage of passerine birds resembling thrushes in a general way, which has been formed as a sort of catch-all to contain many genera difficult of definite assignment elsewhere. All are birds of the Old World, and most of them belong to the

A TIMELINE TYPE.

The slaty-headed babbling thrush (*Pomatorhinus schisticeps*) of the Himalaya Mountains.

Oriental and Ethiopian regions, and are denizens of woods, jungles, and rough mountains. The most distinctive timelines, perhaps, are the babbling thrushes of the genera *Timelia*, *Pomatorhinus*, *Orthonyx*, and their allies, and the hill robins of the genus *Liothrix*.

TIME OF ADVENT. See ADVENT.

TIMES, THE. A famous daily newspaper of London, England. Its publication really began Jan. 1, 1785, with the first number of the *London Daily Universal Register*, the present name being first applied to the issue of Jan. 1, 1788, by its founder, John Walter (1735-1812). The paper was, up to 1908, managed and controlled by the descendants of the first John Walter, his successors being John Walter (1776-1847), John Walter (1818-04), and Arthur Fraser Walter (1846-1910). Under their skillful management, with the assistance of some of the ablest journalists the world has known, the *Times* has achieved a reputation for unequalled journalistic enterprise and unusual political influence. It has also been a pioneer in the adoption of new inventions in printing and publishing. Among improvements of the latter sort, one of the greatest was the introduction of steam printing presses, the use of which was begun with the issue of Nov. 29, 1814, in spite of strong opposition from the employees. Subsequently experiments in the *Times* office led to the perfection of stereotyping, to the introduction of the Walter press, from which by the use of stereotype plates the paper was printed on both sides by a single operation, and to important improvements in folding, stitching, and typesetting machines. A farther improvement was the introduction of the Wicks Rotary Type-casting Machine in 1899.

For the first few years of its existence the *Times* was edited and managed solely by the two Walters—father and son. Its outspoken crit-

icism of the King and his Ministers during this period drew down on the proprietors the wrath of the government, and as a result they were several times fined and imprisoned in Newgate. Several attempts were likewise made to hamper or suppress their foreign news service, but this department of the paper had been carefully and systematically developed with the result that the news of Trafalgar and Waterloo and other notable victories of the British arms were published in London before the arrival of the official dispatches.

For some time prior to 1816 the *Times* was edited by Sir John Stoddart. In the latter year the editorial control was intrusted to Thomas Barnes. He was assisted as a leader writer by Edward Sterling, whose virile articles earned for it the name of "The Thunderer." For a period of 36 years—from 1841 to 1877—the editor was John Thaddeus Delane (q.v.), one of the greatest of English journalists. He was succeeded in turn by Thomas Chenery, upon whose death in 1884 George Earle Buckle became editor. The influence and position of the *Times* rank it as having been for nearly a century unquestionably the leading paper of the British Empire. It has remained independent of party and has consistently favored a strong foreign policy and a constant strengthening of the ties between the mother country and the colonies. It supported in turn Beaconsfield's stand on the Eastern question and Gladstone's Egyptian policy. When, however, the latter adopted the idea of Home Rule for Ireland, the *Times* withdrew its support, was an active factor in the promotion of the Liberal-Unionist party, and contributed largely to the defeat of the Home Rule bills. It was in the course of this campaign that it made one of its few great blunders in the publication of the famous Pigott forgeries, known as "The Parnell Letters." It supported Salisbury's ministry in its South African policy in 1899-1902, although it vigorously criticized the conduct of the war after it had begun. In addition to its daily issue the *Times* publishes a tri-weekly, known as the *Mail*, a weekly edition (1877-), a weekly *Literary Supplement* (1901-), and other periodical supplements concerned with law, commerce, engineering, education, and finance. Supplements on Russia, South America, etc., have been republished in volumes. It has published also an *Atlas* (first edition, 1895) and a *Gazetteer*, and in 1898 undertook a reprint of the *Encyclopædia Britannica*, which, with the subsequently published supplementary volumes, constitutes the tenth edition of that work.

Two other notable invasions of the book field were represented by M. Busch, *Bismarck: Some Secret Pages of His History* (published for the *Times* by Macmillan, London, 1898), and *The Times History of the War in South Africa* (completed in 6 vols., ib., 1909). In 1908 an epoch in the history of the *Times* was made when the paper passed into the hands of a stock company financially controlled by Lord Northcliffe (Alfred Charles William Harmsworth). Mr. A. F. Walter (1846-1910), who had been chief owner since 1891, then became chairman of the board of directors and Mr. C. Moberly Bell (1847-1911) became managing director. In 1910 Mr. A. F. Walter's son, John Walter (1873-), took his father's place. In 1912 Mr. Geoffrey Robinson became editor of the *Times* and director of the Times

Publishing Company. In the period before the Great War, the *Times* steadily urged a larger army, and more complete preparations for defense, and pointed out the grave danger of an attack on the British Empire by Germany. It criticized the conduct of the war, and did much to bring about the coalition ministry, May, 1915. In common with other newspapers, the *Times* was unable under a rigid censorship to anticipate the official publication of war news. Consult: *Progress of British Newspapers in the 19th Century* (London, 1901); S. V. Makower, *Some Notes Upon the History of the Times, 1785-1904* (Edinburgh, 1904); A. I. Dasent, *John Thaddeus Delane* (2 vols., ib., 1908); and Sir E. T. Cook, *John Delane, in "Makers of the Nineteenth Century Series"* (New York, 1915). See also NEWSPAPER.

TIMES, THE (NEW YORK). See NEWSPAPER.

TIME SIGNALS. Signals used for the accurate regulation of clocks and watches. In the United States time signals are based on astronomical observations made at the United States Naval Observatory in Washington. These observations enable the astronomers there to keep their standard clock regulated; and from this clock a daily noon signal is sent out by electric telegraph to the Western Union Telegraph Company. This company in turn uses the observatory signal to regulate its standard clock, from which accurate time is distributed telegraphically to the public. Various persons, jewelers, and others, who are subscribers to the Western Union time service, receive signals electrically, and are thus able to keep their own standard clocks correct. In certain places a time ball is let fall exactly at noon by means of an automatic electric signal from the telegraph company, and the public are enabled to regulate watches and clocks. In England an analogous time service is furnished from the Royal Observatory at Greenwich; and other European countries, such as France and Germany, have similar arrangements in successful operation. Thus the direct determination of time by actual astronomical observation has been rendered unnecessary on the part of jewelers and nautical instrument makers. These latter were formerly compelled to observe time stars themselves with small transit instruments (q.v.), in order to regulate the chronometers of vessels about to put to sea.

In the most recent development of time signaling wireless telegraphy is used. In 1908 the Bureau des Longitudes suggested the advantages to be derived from a series of hourly wireless signals from the Eiffel Tower for the determination of longitudes. The service was first put into operation in 1910. Soon afterward other stations began to send out signals by wireless telegraphy, and the possibility of confusion arising from the overlapping of signals from different stations led the French government to call an International Conference for the regulation of the whole question. The conference met in 1912, and formulated a scheme whereby wireless signals would be sent out on the even hours of Greenwich time, the entire work being shared by 10 or 12 stations situated in widely scattered parts of the globe. The scheme went into effect on July 1, 1913, but, on account of the European war, was suspended.

TIME STUDY. A process of analytical determination and record of manual, mechanical, or other operations, used by the practitioners

of Scientific Management (q.v.) to fix standards of performance and remuneration. Its successful prosecution demands specially-trained observers, the coöperation of the workers under observation, and the use of the stop-watch. By resolving the operation into its elements and measuring them separately, those parts of the cycle which are variable in time requirement may be identified and separated from those which are fixed; delays may be detected and measured, their extent determined, and their causes discovered; units may be isolated for reassembly in other combinations, and a definite and exact knowledge may be put in the place of the general intuition or experience which, under the older fashion of management, formed the basis of an estimate, or a more or less assured guess at the total time in a lump.

TIME-TABLE. See RAILWAYS.

TIM'GAD. The site of *Colonia Marciana Trajana Thamugas*, a town founded by Trajan 100 A.D. and named from his sister. It was a fortified post on the road between Theveste and Lambaesis or Lambaesa (see LAMBESSA). It is in the department of Constantine, Algeria. It preserves the military plan of the outpost which it replaced, in its two main streets, *Decumanus Maximus* and *Cardo Maximus*. Originally laid out as a rectangle, 357 m. by 324 m., with eleven streets intersecting at right angles, as the town expanded in the second and third centuries, the new streets gave up this regularity. Monotony was avoided by colonnades along the main streets and fountains at many corners. The main entrance to the town was from the northern end of the *Cardo Maximus*. Inside the gate, on the left, was a bath, and, one block from the Forum, a library erected by a citizen at a cost of 400,000 sesterces. The Forum, which was entered from the *Cardo*, through a monumental gate, is a rectangle, 50 m. by 43 m., surrounded by porticoes. On its western side are the Curia and a temple. Much of the eastern side is occupied by the basilica, to the north of which was the public toilet. South of the Forum is the theatre, dating from the second century. It accommodated 3500 people. While the simple dwellings recall those of Pompeii by their plain exteriors, they differ from them internally. Instead of an atrium there is often a court, much like a patio, paved and supplied with a fountain. Sometimes one house occupied a whole block. The majority were supplied with water, and, when more luxurious, with baths. Except the public and private baths the buildings were not heated, which is astonishing when one recalls that in Italy such comforts were common. Of the public baths the most imposing, 80 m. long by 66 m. wide, was located just outside the northern gate of the city; it contained over 30 halls. Besides the public or city baths were those established by individuals or societies, such as those called *Filadelfes*. The capitol, situated to the southwest of the original limits of Timgad, is almost entirely destroyed; but its dimensions, 53 m. by 23 m., indicate that the structure was imposing in appearance. The building was of the Corinthian order, with six columns along the front and colonnades along the side. Around it was a great court with porticoes. Throughout the town many inscriptions and statues have been found.

In the third century the town had become Christianized, and in the fourth it was an

important centre for the Donatists. From the time of its foundation the city apparently prospered, but, as the Roman Empire declined in the fourth century, Timgad too declined. The city suffered also through the invasions of Vandals, Byzantines, and Arabs. The life of the city in fact terminated with the appearance of the Arabs. From then until the nineteenth century—except for stray visitors—the town was unnoticed. In 1881 the *Service des Monuments historiques* undertook to clear the site. After some interruption the work was resumed in 1892 and then carried on regularly with the result that Timgad may justly be called the African Pompeii. Besides the structures named above there are two triumphal arches, one in honor of Trajan. Consult: Albert Ballu, *Guide illustré de Timgad* (2d ed., Paris, 1911); id., *Les ruines de Timgad: sept années de découvertes*, 1903-10 (ib., 1911); and W. Cart, "Timgad, la Pompeii Algérienne," in *Bibliothèque universelle* (ib., Nov. and Dec., 1915).

TIM'OCLES (Lat., from Gk. Τιμοκλῆς, *Timoklēs*) (4th cent. B.C.). An Athenian comic poet, belonging to the Middle Comedy, noted for his pungent style and for his attacks on Demosthenes. Consult T. Kock, *Comicorum Atticorum Fragmenta*, vol. ii (Leipzig, 1886).

TIMO'CREON (Lat., from Gk. Τιμοκρέων, *Timokreōn*). A Greek lyric poet of the early fifth century B.C., born at Ialysus, in Rhodes. His works are lost, but his name has survived through his hatred for Themistocles, whom he bitterly attacked. The statesman was defended, however, by his friend Simonides, whose sarcastic epigram on Timocreon's gluttony and bibulous habits has been preserved by Athenæus. He excelled in drinking songs, to which he gave a satiric tone. Fragments are in Bergk, *Poetæ Lyrici Græci*, vol. iii (5th ed., Leipzig, 1914).

TIMOFEYEFF, YERMAK. See YERMAK TIMOFEYEFF.

TIMO'LEON (Lat., from Gk. Τιμόλεων, *Timoleōn*) (c.394-337 B.C.). A Greek general, the liberator of Sicily from the dominion of Dionysius the Younger. He was born at Corinth, of a noble and illustrious family. In battle he saved his brother Timophanes' life at the risk of his own, but, when Timophanes attempted to overthrow the democratic form of government at Corinth and make himself sole tyrant, Timoleon brought about his brother's death and the re-establishment of the old constitution. Just after this event, and while the Corinthians were still deliberating with regard to the act, in 344 B.C., an embassy arrived at Corinth from Syracuse in Sicily, a colony of Corinth, requesting the aid of the Corinthians in the civil dissensions in the island. A force was sent to assist the Syracusans, with Timoleon at the head. In Sicily at this time Hicetas and Dionysius the Younger were both striving to obtain the supremacy in Syracuse (q.v.). The force commanded by Timoleon was small, but in a short time he drove both of the would-be tyrants from the city. After repeopling the almost desolate city by recalling the exiles, and inviting new colonists from Greece, Italy, and Sicily, he spent the next two years in enacting laws and organizing a constitution, which he put on a completely democratic footing. The Carthaginians, alarmed at the reviving power of Syracuse, and the prospect of union among the Sicilian Greeks, now sent an army of 80,000 men under Hasdrubal and Hamilcar to subdue the whole is-

land. Timoleon, with only 12,000 men, encountered them (330 B.C.) on the Crimissus, and gained one of the greatest victories ever won by Greeks over barbarians. He now proceeded to free the other Greek cities from the rule of the tyrants, and made a treaty with the Carthaginians, whereby the Halycus River was fixed as the boundary between the Greek and the Carthaginian dominions in Sicily. Hicetas was driven from Leontini, and Mamercus from Catana, and free constitutions were conferred upon all the Greek cities in Sicily. After his great work was accomplished Timoleon lived as a private citizen at Syracuse, respected and honored, until his death. He was buried in the market place of Syracuse, where a Gymnasium, called the Timoleonteum, was afterward erected over his tomb. Consult Plutarch's *Life of Timoleon*, the standard histories of Greece, and E. A. Freeman, *History of Sicily* (Oxford, 1891-94).

TIMON (Lat., from Gk. *Τίμων*), called **THE MISANTHROPE**. A native of Athens, who lived at the time of the Peloponnesian War. The little that is known concerning him is learned chiefly from Aristophanes and the other comic poets of the period, and from Lucian, who made him the subject of one of his best-known dialogues. Disgusted with mankind, on account of the ingratitude of his early friends and companions, he lived a life of almost total seclusion from society, the only visitor whom he would receive being Alcibiades. Shakespeare's *Timon of Athens* has as its ultimate source Lucian's dialogue.

TIMON OF ATHENS. A tragedy produced in 1607 or 1608, printed in 1623, of which Shakespeare wrote only the chief scenes, and which another, possibly Wilkins, finished; or perhaps Shakespeare's remodeling of an old play. The sources are the story of Timon told in the life of Antony in North's *Plutarch* and in Painter's *Palace of Pleasure*, and used by Boiardo in his comedy *Il Timone*.

TIMON OF PHLIUS. A Greek poet and skeptic, who lived at Athens about 275 B.C. He wrote numerous works in both prose and verse. The most celebrated of his poems were the three books of *Σάλας*, in which, in the form of a parody of Homer's epic poetry, he ridicules the tenets of all dogmatic philosophers, living or dead, from the skeptic's point of view. Like the classic satire of Rome, these pieces were written in hexameter verse and, according to the testimony of the ancients (Diog. Laërt. ix. 12, 109-115; Euseb. Praep. Ev. xiv. p. 761), were excellent productions of their kind. The fragments are published in Wölke, *De Græcorum Syllis* (Warsaw, 1820); Paul, *Dissertatio de Syllis* (Berlin, 1821); and Wachsmuth, *De Timone Phlasiō Ceterisque Sillographis Græcis* (Leipzig, 1885).

TIMOR, *tê-môr'*. The largest and most southeasterly of the Lesser Sunda Islands, situated 330 miles southeast of Celebes and 700 miles east of Java, between which and Timor the main chain of Lesser Sunda Islands intervenes (Map: Australasia, E 3). It has an extreme length from northeast to southwest of about 280 miles, with an average breadth of 55 miles, and an area estimated at 12,593 square miles. The coasts are for the most part steep, lined with coral reefs, and difficult of approach. The interior is not well known. It is traversed by a forest-covered mountain range, and the geological formation seems to be a core of slate, di-

rite, and serpentine flanked by beds of carboniferous limestone, Triassic sandstone, and some Tertiary formations. The mineral wealth is considerable, but unexploited. The climate is hot and unhealthful on the coast, and the rainfall is very slight, especially in the south. The flora and fauna are less varied than in the other East Indian islands, and the island forms a transition region between these and Australia. The resources of the island are not developed; agriculture is primitive, and the exports are few and small in quantity, coffee, wax, and a little sandalwood being the chief staples. Politically the island is divided nearly equally between Holland and Portugal, the latter possessing the northeastern half, with the seat of government at the small town of Deli or Dilli. The Dutch portion forms the principal member of the Residency of Timor, which includes also the islands of Rotti, Savu, and Sumba, eastern Flores, and the Solar and Allor groups. The capital of the Residency is Kupang, a town of about 8500 inhabitants at the southern extremity of the island. The inhabitants of the island are mainly Papuans with some intermixture of Malays and Chinese. The Portuguese estimate the population of the part of the island controlled by them at 300,000, and the Dutch estimate the population of their part at 308,500. The number of Europeans in the entire Dutch Residency was only 372 in 1905. Consult: Wichmann, *Sammlungen des Geologischen Reichsmuseum* (Leyden, 1881-84); A. Bastian, *Indonesien* (Berlin, 1885); H. O. Forbes, *A Naturalist's Wanderings in the Eastern Archipelago* (London, 1885).

TIMORLAUT, *tê-môr'lout*, or **TENIMBER**. A group of coralline islands in the East Indian Archipelago belonging to the Dutch Residency of Amboina, and situated between the Banda and Arafura seas, 240 miles southeast of the island of Ceram in the Moluccas and about midway between New Guinea and the Lesser Sunda Islands (Map: Australasia, F 3). It consists of the large islands of Yamdena (1151 square miles), Larat, a volcanic island, and Selaru, and a number of smaller islands, with a total area of about 2096 square miles. The large islands are hilly and forested, rising to a height of about 1000 feet, while the others are low and flat, and of coral formation. The inhabitants, a mixture of Malays and Negritos, are engaged in primitive agriculture, cattle raising, and trepang fishery. Pop., about 25,000.

TIMOTE, *tê-mô'tâ*. A group of small tribes apparently constituting a distinct linguistic stock, whose modern representatives still occupy the mountainous district of Mérida, southward from Lake Maracaibo, in western Venezuela. In former times they usually went naked, with their bodies painted red, and were agricultural, cultivating corn, chile, and various edible roots. They buried their dead in caves or in underground vaults, depositing with the corpse sacred figurines of clay. Consult: Ernst, in *Zeitschrift für Ethnologie* (Berlin, 1885); José Ignacio Lares, *Resumen de las Actas de la Academia Venezolana*, 1886 (Caracas, 1886); D. G. Brin-ton, *The American Race* (New York, 1891).

TIMOTHEUS, *ti-mô'thê-üs* (Lat., from Gk. *Τίμβθεος*), or **MILETUS** (c.450-c.357 B.C.). A Greek poet and musician, son of Thersander. He was first of all a citharodes—one who, while singing, played his accompaniment on the cithara. The form of lyric poetry used for these performances was the *Nomos*, whose name Ter-

pander was said to have established. Originally this was a musical performance of hexameters from the epic, but Timotheus gave definite form to novelties already attempted, and greatly increased artistic display by introducing a free metrical structure, giving full scope for elaborate composition and vocal execution. He enlarged his opportunities by increasing the number of cithara strings to 11. His innovations met with strong opposition, and were distasteful to the Spartans, against whom he defends himself in his "Persians." His works have till recently been known only through scanty fragments and allusions, but in 1902 a papyrus manuscript of his nomos, the "Persians," was discovered by the German Oriental Society in a Greek sarcophagus at Abusir, near Memphis, in Egypt. About 116 lines of considerable length are preserved, and 80 of these are practically complete. It is the oldest Greek manuscript yet found and was copied but a few years after the death of the author, and the fact that it is the only specimen of this branch of the Greek lyric lends special value to the poem. The subject is the defeat of the Persians at Salamis, and it seems to belong to the early years of the fourth century, when Athens was humbled and Sparta supreme, for in the vivid description of the battle there is no mention of Athens. The dialect, however, is the Attic of the poets. Timotheus seems to have been less a poet than a musician, and with only his libretto it is scarcely possible to estimate properly his real position in Greek literary art. Consult: U. von Wilamowitz-Möllendorf, *Timotheos, Die Perser* (Leipzig, 1903), text, a Greek paraphrase, and explanatory essay; *Der Timotheos Papyrus* (ib., 1903), photographic facsimile; Reinach and Croiset, in *Revue des études grecques*, vol. xvi (Paris, 1903), an essay and translation into French; W. C. Wright, *A Short History of Greek Literature* (New York, 1907); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i (6th ed., Munich, 1912). For the nomos or nome, see H. W. Smyth, *Greek Melic Poets* (New York, 1900).

TIMOTHY (Gk. *Τιμόθεος*, *Timotheos*, honoring God). One of the assistants of the Apostle Paul. Our most reliable information regarding Timothy is that contained in the undoubted Epistles of Paul and in Acts. The credibility of what is said or implied about him in the Epistles to Timothy depends on the character of those Epistles (q.v.). He was a native of Lystra, in Lycaonia, the son of a Gentile father and a Jewish mother (Acts xvi. 1). The circumstances of his conversion are unknown. On Paul's second visit to Lystra Timothy was already favorably known in the neighborhood as an active Christian. Paul persuaded him to go with him as an assistant. To avoid unnecessary offense to the Jews, he was circumcised (Acts xvi. 2-3). These statements of Acts may be supplemented by those in 2 Tim. iii. 15, i. 5; 1 Tim. i. 8, iv. 14. From this time until the close of Paul's life Timothy was one of his most faithful, trusted, and intimate disciples. He was intrusted several times with important missions to the churches founded by the Apostle. At Berea (Acts xvii. 14), Athens, and Thessalonica (1 Thess. iii. 1-6), at Corinth, and later at Ephesus (1 Cor. iv. 17, xvi. 10), and again in Macedonia (Acts xix. 21-22) he rendered important services, and is joined with himself by Paul in the addresses of several of his epistles.

His important and delicate mission to Corinth, however, seems to have resulted unfavorably (see CORINTHIANS, EPISTLES OF PAUL TO THE). Though he went to Jerusalem with Paul (Acts xx. 4), he was probably engaged in labors elsewhere when the Apostle embarked on his voyage to Rome. He visited his master at Rome (see the opening words of Philippians, Colossians, and Philemon), and was probably sent by Paul, shortly before his release, with a message to Philippi (Phil. ii. 19). According to the usual interpretation of 1 and 2 Timothy, after the Apostle's release he joined Timothy in the East, and later left him in charge at Ephesus in a position full of great responsibility. In his anxiety Paul wrote him the letter of advice and warning known as 1 Timothy. When Paul was imprisoned the second time, and probably not long before his death, he wrote 2 Timothy, summoning his beloved disciple to come to him as quickly as possible. At some later date Timothy himself was arrested, but afterward released (Heb. xiii. 23). According to tradition he passed the remainder of his days as Bishop of Ephesus.

TIMOTHY AND TITUS, EPISTLES TO. Three New Testament letters, often designated the Pastoral Epistles. These three epistles form a group by themselves, in that they are very similar to each other in general character, style, and vocabulary, and seem to have been occasioned by the same general situation and written by the same author.

1 Timothy, purporting to be from Paul to his younger disciple and associate Timothy, opens by Paul reminding Timothy that he had left him in Ephesus to combat teachings that were opposed to the gospel as Paul taught it (i. 1-17). Specific directions on various points of church order follow. Timothy is to see that these are obeyed (i. 18-iii. 16). Reverting to the subject of heretical teachers, Timothy is urged to exercise the most careful watch over his own conduct that it may be exemplary in every respect (iv. 1-v. 2). Special instructions follow as to how to deal with certain specified classes in the Church (v. 3-vi. 2). Turning once more to the subject of the false teachers, especially those who are actuated by the love of money, Paul urges Timothy to courageous and loyal devotion to his Master Jesus Christ (vi. 3-21). Only a brief benediction (in which "you" is plural), with no salutations, closes the letter.

The Epistle to Titus is briefer but quite similar to 1 Timothy. After a rather long introduction (i. 1-4) the letter explains that Titus had been left in Crete to complete the organization of the Church there (i. 5), in particular, to install elders or bishops, whose qualifications are stated (i. 6-9; cf. 1 Tim. iii. 1-8). The generally low-minded character of the Cretans and the presence of false teachers make this more necessary (i. 10-16). Titus is next advised as to how he should conduct himself towards different classes (cf. 1 Tim. v. 3-vi. 2) as is required by the nature of the Christian salvation (ii. 1-15). Titus is next urged to teach his people to practice the principles of morality in all their relations in life (iii. 1-8), avoiding heretical opinions and persons (iii. 9-11). Personal directions to Titus, salutations, and a benediction close the letter (iii. 12-15).

2 Timothy has more decidedly the appearance of a private letter. The first section, full of exhortation to Timothy to be faithful to his

trust, closes with a reference to the Apostle's own suffering for the faith, his treatment by enemies, and his gratitude for the kindness shown by Onesiphorus (i. 1-14). Timothy is urged to be courageous, earnest, and faithful in administering his charge (ii. 1-13). Against all false teaching and teachers he is to take a firm stand (ii. 14-19), insisting by word and example that the test of true doctrine is sound morality (ii. 20-26). The last times, full of hardship and wickedness, are at hand (iii. 1-9); but, like Paul himself, Timothy must remain loyal and manfully endure persecution (iii. 10-iv. 5). Paul expecting his end to come soon, and deserted by many, summons Timothy to come to him (at Rome?), adding certain minor requests (iv. 9-15) and a reference to his trial and prospect of martyrdom (iv. 16-18). Salutations, information, greetings, and a benediction close the letter.

The Pauline authorship of the Pastoral Epistles is questioned by many scholars, and for reasons that cannot be called arbitrary. It is generally admitted that the problem is a serious one, even by those who still hold the traditional opinion. No one who has made a close study of the remaining 10 Pauline Epistles, has become fairly familiar with their thought and style, and has gained from them to some extent a familiarity with the Apostle's mind, can read the Pastorals without being conscious that here he has something different—a different habit of thought, vocabulary, point of view, and set of interests, which even the presence of the name of Paul in the letters and the many personal allusions do not avail to offset. Briefly, these differences between the Pastorals and the Epistles accepted as Paul's (and our knowledge of Paul derived from Acts) may be specified as follows: (a) the character of the church organization; (b) the nature of the heresies combated; (c) the situation (or situations) in which Paul and those addressed are placed; (d) the literary character of the Pastorals, especially their vocabulary; (e) the general character of the Christianity of the Pastoral Epistles. In the earlier stages of criticism it was on the first two of these points that the chief emphasis was laid. But to-day it is quite freely admitted, on the one hand, that we know very little about the details of the church organization of the apostolic age or of the nature of early heresies, and, on the other, that on these matters the statements of the Pastorals, interpreted fairly, do not necessarily imply a post-Pauline date. It is otherwise, however, with the last three points. No known period of the Apostle's life presents the situation required by these Epistles. Usually it has been held that 2 Timothy implied a second imprisonment of Paul at Rome, and consequently 1 Timothy and Titus belonged to a period of missionary activity between the first imprisonment (where the record of Acts ends) and a second one, known only from vague tradition. This is possible, but cannot be proved. But even on this supposition the movements of Paul and his companions are anything but clearly discerned from these letters, and it is most difficult to construct a consistent picture of the situation. To say the least, this creates a suspicion that the letters may not be genuine letters of Paul. The last two points (d) and (e) are, however, the ones that seem most decisive against the Pauline authorship. The vocabulary of the Pastorals is

strikingly un-Pauline, containing a remarkably large number of words not used in the other Pauline Epistles and omitting many characteristically Pauline words or expressions where such would be expected to occur. This feature of an un-Pauline character of the language is so deeply stamped upon these letters that the supposition of Pauline authorship (even on the hypothesis of a different amanuensis) is almost impossible. The general character of the Christianity of these letters differs considerably from the well-known Pauline type. The distinctively Pauline characteristics are absent or are appreciably modified. The Christianity of the Pastorals can easily be explained as that of the next succeeding age when the general positions of the Christian faith had become fixed and the distinctively Pauline type had become somewhat obscured and matters had settled more nearly to the level we reach in the Christianity of the first half of the second century. For these reasons the most natural date for the Pastorals seems to be somewhere between the period of Paul's own activity and the age of the so-called Apostolic Fathers, or about 90 A.D.

The most serious objections to the argument sketched above are (a) the large number of personal allusions, the use of personal names, etc., which seem to make so strongly for genuineness (especially in the case of 2 Timothy), and (b) the difficulty of accounting for the acceptance and circulation of spurious Pauline Epistles in a period so soon after the time of Paul himself (it is generally acknowledged that the Pastorals cannot be dated much later than 100 A.D.). In regard to (a), some have thought that use was made (especially in 2 Timothy) of fragments of Pauline correspondence, but this hypothesis is difficult to work out successfully. In regard to (b), it must be remembered that literary habits and standards were somewhat different in ancient times from those we are familiar with. Spurious writings could circulate more easily and the practice of pseudonymity was not viewed as reprehensible, if done to promote the cause of truth or sound doctrine.

The general purpose of the Pastorals may be said to have been to furnish the Church with a convenient set of instructions regarding the administration of church affairs and the necessity of combating the insidious and corrupting forms of error that threatened to work the moral undoing of the Church.

Hence though apparently private letters, in the words of the Muratorian Canon (c.175 A.D.), —*in honore tamen ecclesie catholice in ordinationem ecclesiastica disciplina sanctificata sunt*, which may be rendered—"nevertheless they have been sanctified in honor of the Church universal and in the regulation of ecclesiastical discipline."

Bibliography. The article by W. Lock in James Hastings, *Dictionary of the Bible* (new ed. in 1 vol., New York, 1909), and the one by James Moffatt in the *Encyclopædia Biblica* (4 vols., ib., 1899-1903) are comprehensive and present respectively the traditional and the more liberal views. Consult also: Theodor Zahn, *Introduction to the New Testament* (Edinburgh, 1909); James Moffatt, *Introduction to the Literature of the New Testament* (New York, 1911); and the commentaries of R. F. Horton in *The Century Bible* (ib., 1901); N. J. D. White in *The Expositor's Greek Testament* (ib., 1910); M. Dibelius in Leitzmann, *Handbuch zum neuen Testament* (Tübingen, 1913).

TIMOTHY GRASS (so called from Timothy Hanson, who, it is said, introduced its cultivation into the Carolinas about 1720), *Phleum pratense*, the most valuable species of the genus for hay and pasturage. It is the herd's grass of New England and New York, and along with the other species of the genus, is in England often called cat's-tail grass. It has a long cylindrical panicle so compact as to resemble a close spike, strong culms, becoming 4 to 5 feet high, but tender and nutritious, and much relished by cattle. It is perennial, but springs up rapidly, even in the year in which it is sown. The seed is very small. The plant varies in size according to soil and situation. In the United States timothy hay is considered one of the most valuable hays made wholly from grass and is commonly used as the standard with which to compare other hays. (For its feeding value, see GRASSES; HAY.) It may be sown alone, or (more commonly) mixed with clover, generally with red clover. It succeeds best on moist, rich soils. Upon dry soils it is often bulbous at base, and this form, which is due to the conditions of growth, was once described as a distinct species (*Phleum nodosum*). A smaller species, *Phleum alpinum*, is a common grass in alpine regions throughout the Northern Hemisphere. See Plate of GRASSES.

TIM'PERLEY, CHARLES H. (1794–c.1846). An English printer and author, born in Manchester, and educated at the free grammar school there. He served in the Napoleonic wars and was wounded at Waterloo. Returning to England, he worked under an engraver and copperplate printer, and in 1821 he became a letterpress printer. Late in life he settled in London, where he died. His valuable publications connected with printing comprise *The Printer's Manual* (1838); *A Dictionary of Printers and Printing* (1839); and *Songs of the Press*, original and selected, the best collection of printers' songs in English (1833). The first two books were issued in 1842 as an *Encyclopædia of Literary and Typographical Anecdotes*. Timperley also published *Annals of Manchester* (1839).

TIM'ROD, HENRY (1829–67). An American poet, born in Charleston, S. C. He was educated at the University of Georgia and studied law with the well-known jurist James Louis Petigru, but finally became a private tutor in families, which gave him more leisure for verse writing. During the years before the Civil War he formed one of the coterie presided over by William Gilmore Simms (q.v.), and contributed poems to *Russell's Magazine* and the *Southern Literary Messenger*. In 1860 he published a volume of poems which was favorably noticed. He was war correspondent of the *Charleston Mercury* and in 1864 removed to Columbia, S. C. His later years were passed in poverty and physical pain. His friend Paul H. Hayne superintended an edition of his poems (1873), which was well received by competent judges. In 1899 a memorial edition of his works was undertaken. His fame as the best of southern lyrists, after Poe, and probably Sidney Lanier, is now well established. One of his best poems is an admirable ode on the Confederate dead buried in Magnolia Cemetery, Charleston. Consult J. A. B. Scherer, *Holy Grail: Six Addresses* (Philadelphia, 1905).

TIMSAH, tim'sä, LAKE. A lake traversed by the Suez Canal (q.v.).

TIMUCUA, tē-mōō'kwā, or TIMUQUANAN (ruler, master). A group of tribes, constituting

a distinct linguistic stock, formerly occupying central and northern Florida from about Tampa Bay and Cape Canaveral northward to St. Mary's River. When first known to the Spaniards they had about 40 settlements, principally along the lower St. John's River. Narváez (1527) and De Soto (1539) both passed through their territory, each meeting determined resistance. The Huguenots, under Laudonnière, landing on the east coast in 1564, were received with friendship, continued during the brief existence of the French colony. At this time there seem to have been at least five cognate tribes, with differing dialects. On the expulsion of the French the Timucua came under the dominion of the Spaniards, by whom they were compelled to work upon the fortifications of St. Augustine. In 1687, greatly diminished, they made an unsuccessful attempt to revolt. In 1702–06 inroads of the English of Carolina, with their hundreds of Indian allies, wiped out the mission villages of the Timucua, who fled to the upper waters of the St. John's, where Tomoco River in the present Volusia County preserves their name. The Seminole (q.v.) took their abandoned territory. Consult Pareja, *Arte de la lengua timuquana* (new ed. by Adam and Vinson, Paris, 1886).

TIMUR, tē-moor', TIMUR-BEG, TAMERLANE, or TIMUR-LENG (Timur the Lame) (1336–1405). A Mongol conqueror, born at Kesh or Sebz, about 40 miles south of Samarkand. His father Tera-gai was head of the clan of Berlas. Among the Mongol chiefs who were then in control of Turkistan was Haji Berlas, uncle of Timur, who had established himself at Kesh, and here the future conqueror passed his youth under the careful guidance of his studious father. In 1360 the Kalmucks of Jettah, led by Tughlak Timur, subjugated Turkistan. Declining to accompany his uncle in flight, Timur met Tughlak, who made him governor of Kesh. The Kalmucks were ultimately expelled in 1365, and Turkistan was divided between its two liberators, Hussain and Timur. In 1369 war broke out between them, Hussain was defeated and slain, and Timur became lord of Turkistan. He then proceeded to take vengeance on the Kalmucks and turned westward to punish the predatory tribes of Khwarizm, who had plundered Bokhara. He spent the interval between these campaigns in supporting Toktemesh Khan, one of the claimants to the throne of Kiptchak, whom he placed in 1376 in undisputed possession. In 1383 the people of Herat, whom he had subdued a short time before, rebelled and murdered his envoys. In punishment for this 2000 of the garrison, built up with alternate layers of brick and mortar into the form of a pyramid, were left by Timur as a reminder of the consequences of rebellion. In the following year he invaded Mazanderan, and by the close of 1387 the whole of the country east of the Tigris, from Tiflis to Shiraz, was subdued.

Meanwhile, Toktemesh Khan invaded Timur's territories on the Amu. Timur brought him to bay on the banks of the Bielaya (a tributary of the Kama), June 18, 1391, where he almost annihilated his forces. In 1392 Timur subdued the warlike principalities to the east of the Euphrates, then advanced northward, through the gates of Derbend, to the Volga; and after again routing Toktemesh at the Terek in 1395, he extended his conquests as far as Moscow, returning by Astrakhan and the Caucasus. In 1398 Timur entered India by the passes of the Hindu Kush,

near Kabul, and routed the opposing armies till the number of prisoners became so great that four days before the great battle at Delhi he ordered the murder of all the males (said to be 100,000 in number), and then took the capital. After advancing to the Ganges, Timur returned to Samarkand, where he expended the spoils of the expedition in the adornment of his city. In the following year he attacked the Egyptian Empire in Syria, and was as usual successful. Timur's aid was then invoked by the Emperor of the East and other princes to help them defeat the Turks led by Bajazet I (q.v.). The two hosts met at Angora on July 20, 1402, and Bajazet was defeated and captured. The conquest of the whole of Asia Minor speedily followed. The Byzantine Emperor as well as the Turkish ruler of Thrace did homage to the victor. On his return Timur conquered Georgia, where he passed the winter, and, resuming his march in the following year, he reached Samarkand in 1404. Here he resumed preparations for his long projected invasion of China, and was marching along the Sihun when he was attacked by ague, and died after a week's illness, Feb. 17, 1405.

Timur did much to promote the arts and sciences throughout his dominions, and, despite his cruelty in war, was an able and kindly ruler in time of peace, although the speedy dissolution of his Empire deprived his labors of any permanent utility. Two works are attributed to him, entitled *Malfūzāt*, or Annals, translated by Stewart (London, 1830), and *Tukūzāt*, or Ordinances, translated by Davy-White (Oxford, 1783) and Langlès (Paris, 1878). Their authenticity is neither proved nor disproved. In literature Timur is best known through Marlowe's (q.v.) drama *Tamburlaine the Great*. Consult: Sharaf ud din Ali Yazdi, *Zafarnamah*, translated by Petis de la Croix, *Histoire de Timur-Bec, connu sur le nom du grand Tamerlan* (4 vols., Paris, 1722); Manger, *Vita Timuri*, a translation of the Arabic biography by Ibn Arabshah (Leeuwarden, 1767-72); Stanley Lane-Poole, *Medieval India* (London, 1903); Horn, "Geschichte Irans in islamitischer Zeit," in Geiger and Kuhn, *Grundriss der iranischen Philologie*, vol. ii (Strassburg, 1904); "Cour-Emir," in *Les mosquées de Samarcande*, part i, published by the Commission Impériale Archéologique (St. Petersburg, 1905).

TIN (AS. *tin*, OHG. *zin*, Ger. *Zinn*, tin; connected with Goth. *tains*, AS. *tān*, OHG. *zein*, twig, thin leaf of metal). One of the elements, a metal known since times of great antiquity. Relics of Assyrian civilization include implements made of alloyed copper and tin, a form of what is now known as bronze. The tin used in making the alloy was obtained by the Phœnicians from the Cassiterides, islands probably situated somewhere off the west coast of Europe. The location of this source of supply has given its name to the principal ore of tin—cassiterite. It is known that after the Roman conquest of Britain, tin was carried from the Cornish mines through Gaul by way of Marseilles to Italy. Pliny distinguished tin as *plumbum album* or *candidum* from *plumbum nigrum* (lead), and about the fourth century the name "stannum" was given to tin. Because of its qualities, among which is the property of forming brittle alloys, the alchemists called it *diabolus metallorum*; by others it was called jupiter. It is sometimes found native in irregu-

lar, rounded, crystalline grains, or aggregations of grains. It occurs with platinum, iridosmine, gold, copper, cassiterite, and corundum in washings from the Aberfoil and San rivers (headwaters of the Clarence River) near Obau, New South Wales. Other occurrences of native tin have been reported, but all of them are doubtful. The principal tin ore is cassiterite, tin oxide (SnO_2), in which tin forms 78.6 per cent and oxygen 21.4 per cent. Sometimes a little Ta_2O_5 enters into association with it. Cassiterite is often referred to as tinstone. It occurs in crystals and massive, and has specific gravity varying from 6.7 to 7.02, the ordinary variety being about 6.96. Tin is also found as the sulphide, with copper and zinc, the mineral being known as stannite, or tin pyrites. Small quantities of tin are found in other minerals, but not in such quantities as to be of commercial value as tin ores.

Tin (symbol, Sn, stannum; atomic weight, 118.7) is a silver-white, lustrous metal that has a specific gravity of about 7.3, and melts at 235°C . (455°F). It can be easily rolled or hammered out to thin foil and at 100°C . (212°F) it may be drawn into wire, which has but little tenacity. At moderately low temperatures (-48°C) it transforms itself into a modification known as gray tin, which is brittle and useless. This form is sometimes called the tin disease. White tin, which has a fibrous, crystalline structure, is used in the manufacture of tin plate, which is so largely used in the making of cans for preserving foods, and the articles usually referred to as tinware. It is also used for making tinfoil, for making noncorrosible pipe, and for alloys, including amalgam for silvering mirrors, bell metal, Britannia metal, bronze, gun metal, pewter, type metal, etc. A large amount of tin is used for making roofing plates, but the tin is usually, in such uses, alloyed with lead, the resulting plates being known technically as terne sheets. Tin does not oxidize in the air at ordinary temperatures, but is easily oxidized on heating in the air or in oxygen. It forms two oxides. Stannous oxide, or monoxide, is an olive-brown powder obtained when stannous oxalate is heated out of contact with air. It combines with basic radicals to form stannates, of which the sodium stannate is used in calico dyeing and printing. The stannic oxide, or dioxide, which is found native as cassiterite, is obtained as a white powder when tin is heated until it burns in air. In the form of putty powder it is used for polishing plate glass, and for giving a white color to glass and enamels. Stannous chloride, SnCl_2 , and stannic chloride, SnCl_4 , are both used as mordants in dyeing and calico printing under the name of tin salts or tin crystals, and are readily prepared by dissolving the metal in hydrochloric acid. Stannic sulphide, which is prepared by heating tin with mercury, sulphur, and ammonium chloride, is known commercially as mosaic gold, and was formerly used for gilding, imitating bronze, etc. The purple colored precipitate obtained by the reaction of gold chloride on stannous salts has been described under CASSIUS, PURPLE OF. Hot, strong hydrochloric acid dissolves tin readily, forming stannous chloride and evolving hydrogen. Warm, dilute sulphuric acid gives stannous or stannic sulphate, according as the tin or acid is in excess, and hydrogen is evolved; but with hot, concentrated acid sulphur dioxide, sulphureted hydro-

gen and sulphur are obtained in place of hydrogen. The strongest nitric acid has no action; when sufficiently diluted it forms metastannic acid, $H_{10}Sn_2O_{15}$, probably owing to the hydrolysis of previously formed stannic nitrate. The dilute acid forms stannous and ammonium nitrates. Aqua regia forms stannic chloride. Hot, strong, caustic soda or potash forms sodium or potassium stannate with evolution of hydrogen.

Occurrence and Production. Tin ore, or cassiterite, has been found in many parts of the world, but from a commercial standpoint its deposits are limited. Its sources are veins in the older rocks, particularly a variety of granite called greisen, and alluvial deposits, the latter having been formed by the erosion of rocks carrying the veins. The ores obtained from veins are known as lode tin, while those found in stream deposits are known variously, according to locality, as black tin, tin sand, stream tin, and barilla. The principal supplies of ore are obtained from the East Indies, in the islands of Banca, Billiton, and Sumatra, the Malay Peninsula, Australia, Bolivia, and Cornwall, England. Most of the ore from the East Indies and the Malay Peninsula is obtained by washing alluvial gravels. There are also mines in Saxony, Bohemia, Russia, Spain, Portugal, and Japan, but the total output of these countries is insignificant. The presence of tin deposits in California, Texas, South Dakota, and North Carolina has been known for a long time, but up to this time there has been no mining on a commercial scale. A discovery of tin ore in the York District of Alaska has induced exploration in that region, and Bolivia is an important source of tin production. The exports from Bolivia in 1915 were estimated to be about 42,000 tons of tin concentrates, all of which was smelted abroad, since there were no facilities for tin smelting in Bolivia. In the United States the most promising district is along the border of North and South Carolina, extending from Cherokee County, in the latter State, over into Lincoln Co., N. C. These deposits have been worked in a desultory way only, but they may become commercially important if they can be exploited as a unit and in a modern, systematic way. Some ore is produced from the Alaska deposits, but the amount is insignificant as compared with the domestic tin requirements. A smelter for tin ores and an electrolytic plant for the refining of the tin bullion was built at Perth Amboy, N. J., in 1915. This plant was expected to bring South American ores to the United States for smelting, practically all the smelting having been done in Europe heretofore. The accompanying table from the *Engineering and Mining Journal* shows the tin production and consumption for 1915.

In addition to the localities already mentioned, tin is mined in the Belgian Congo, and also at Briseis, Tasmania; at Yunnan, China; Siamese Malaya; and in South Africa.

Metallurgy. The only ore of tin extensively used for the extraction of the metal is tinstone, or cassiterite. The preliminary processes are essentially concentration, and the result is a high-grade product containing 60 per cent or more of tin. See ORE DRESSING.

The tin ore thus provided has next to be deprived of its sulphur and arsenic, if these substances are present. This is usually done in a reverberatory furnace, although one of the forms of roasting machines may be used. The fumes

of the roasting device, whatever its type, are connected with condensing chambers in which the arsenic is deposited in crystalline form. The sulphur, present in the form of iron sulphide,

TIN PRODUCTION AND CONSUMPTION

IN LONG TONS

LOCALITY	1913	1914	1915
Exports, Straits and Malay Pen.	62,242	61,986	66,760

Visible stocks, Dec. 1.	16,045	13,432	14,535

is decomposed by the heat into sulphurous acid gas, and the remaining oxide of iron is removed by subsequent washing. Copper sulphide, when present, is converted into copper sulphate by roasting and oxidation, when it is easily removed by leaching.

After this final washing the ore is ready for smelting, which is usually performed in a reverberatory furnace. The charge consists of from 20 to 25 cwt. of ore mixed with about $\frac{1}{4}$ its weight of powdered anthracite or charcoal, and a small quantity of lime or fluorspar to serve as a flux for the siliceous matter. Before being put into the furnace the mixture is moistened with water to prevent the finely powdered ore from being carried away by the draft. When the charge is placed on the hearth of the furnace, the doors are closed and the heat gradually raised for about six hours. The oxide is then reduced by the carbon. Then the furnace door is opened and the mass worked with a paddle to separate the slag, which is raked off, and the richer portion of it smelted over again. The reduced tin sinks to the bottom, and is run off into a cast-iron pan, from which it is ladled or run into molds to produce ingots of convenient size.

The tin has still to be purified, or refined, and a process of liquation is followed. This consists of moderately heating the tin ingots in a reverberatory furnace until the tin, owing to its low melting point, melts and flows into the refining basin, leaving on the hearth a residuary alloy of tin and other metals. When the refining basin contains its full charge, it is ready for boiling. In this operation billets of green wood are plunged into the melted metal, the disengagement of gas from which gives rise to a constant boiling, and causes a scum, chiefly tin oxide, to rise to the surface. It is then removed, while at the same time the impure and dense particles fall to the bottom. When the agitation has continued long enough the bath is allowed to settle and cool. The tin then separates into zones—the upper consisting of the purest part, the middle being more mixed with other metals, and the lower so impure that it has to go through the refining process again.

The residuary alloy of the liquation process also has its tin extracted and is again refined. While the process described is one that is followed to a great extent, and is the standard one of former practice, modern improvements are making changes that are coming more and more into use. Recent experiments have shown that the electric furnace is probably more adaptable to tin smelting than to most of the other metals. Electrolytic refining is also successful, and has already been incorporated into operating plants.

In former times in Cornwall tin was smelted in a blast furnace, but through the use of this process there is a great deal of waste because of the applications of high temperatures and, besides, the conditions of the blast furnace are such that a great deal of iron is also reduced, a condition that is prejudicial to good smelting practice.

Tin ores that contain the mineral wolframite (tungstate of iron and manganese) are treated by a process patented by Oxland, and known by his name. This mineral cannot be separated successfully because its specific gravity is so nearly that of tin ore. In Oxland's process the tin ore is roasted with sodium sulphate, the insoluble iron tungstate converted into soluble sodium tungstate, which is then leached out. Oxides of iron and manganese are left finely divided, and because of their lower specific gravity they can be washed away from the tin compounds. The tungstate of soda thus obtained has been used for fireproofing cotton cloth.

Tin Plate. A great part of the tin produced is used for making tin plate, which is iron or steel in sheet form, covered on both sides with tin. The sheets are cleaned with acid, after which they are plunged into baths of molten tallow and tin. The tallow prevents oxidation of the tin during the process, which must be carried out at a temperature at which tin would oxidize if allowed to come into contact with the air. After the sheets have taken on a plating of the required thickness they are cleaned with bran.

TINAMOU, tin'a-mōō. The native, and now the popular, name for birds of the family Tinamidae, inhabiting the tropical portions of South America, having many remarkable features in their internal organization, and the striking external character that the tail is exceedingly short or entirely absent. Like partridges in general appearance, and varying in size from that of a quail to the bigness of a large grouse, and prevailing brown in color, they are classed as game birds in South America, and are frequently called partridges. Their flight is strong and swift, but of short duration and very direct, yet they haunt the undergrowth of dense forests or bushy and grassy flats, run with amazing rapidity, and conceal themselves with great skill, rather than take to flight. Their food is miscellaneous, like that of game birds generally, and their voice a mellow whistle. The flesh is delicious. They make very simple

nests on the ground, and lay eggs varying from reddish chocolate, wine purple or liver color, to dark blue or green, and furnished to a metallic sheen. See Plate of CASSOWARIES, ETC.

The tinamous have been regarded by many systematists as within the Ratitæ, but more recently are considered as a separate group of ordinal rank at the foot of the Carinatæ, just preceding the Galliformes. Consult: Hans Gadow, "Aves," in *Bronn's Klassen und Ordnungen des Thier-Reichs* (Leipzig, 1893); Alfred Newton, *Dictionary of Birds* (New York, 1896); Sclater and Hudson, *Argentine Ornithology* (London, 1889); A. H. Evans, "Birds," in *Cambridge Natural History*, vol. ix (New York, 1900); F. H. Knowlton, *Birds of the World* (ib., 1909).

TINAVELLY. See TINNEVELLI.

TINAYRE, tē'nār', MARCELLE (née CHASTEAU) (1877-). A French novelist, born at Tulle and married in 1889 to Julien Tinayre, an engraver. Her first novels attracted little attention, but the third, *Hallé*, was crowned by the French Academy in 1896. Later notable fiction comprises: *L'Oiseau d'Orafe* (1901); *La maison du péché* (1902); *La rebelle* (1906); *L'Amour qui pleure* (1908); *L'Ombre de l'amour* (1910; Eng. trans., *The Shadow of Love*, 1911); *La douceur de vivre* (1911); *Madeleine au miroir* (1912; Eng. trans., *Madeleine at her Mirror*, 1913); *Le départ* (1915). Consult Winifred Stephens, *French Novelists of To-day*, (2d series, New York, 1915). Her novels are didactic, the enfranchisement of woman constituting an important theme; they are marked by rare delicacy and a graceful wit and are strikingly objective and intellectual.

TINCTURA GIOBERTINA. See GIOBERTINE TINCTURE.

TINCTURE (from Lat. *tinctura*, a dyeing, from *tingere*, to dye, Gk. *réryein*, *tengenin*, to moisten, dye). A medicinal preparation of a drug by maceration or by dissolving nonvolatile principles in strong or dilute alcohol. In almost all cases the resulting liquid is of a decided color; hence the name. Obviously tinctures must be kept in tightly closed bottles to prevent evaporation. There are over 70 official tinctures in the *United States Pharmacopœia*. Among these are the tincture of aconite, the once popular tincture of arnica, used for bruises and sprains; the bitter tincture; compound tincture of cinchona; tincture of the chloride of iron; tincture of digitalis; tincture of iodine; tincture of ipecac and opium; compound tincture of lavender; tincture of myrrh, largely employed in mouth washes and dentifrices; tincture of opium, or laudanum; camphorated tincture of opium, or paregoric; tincture of rhubarb; tincture of squill; tincture of valerian; and tincture of ginger, frequently known as essence of ginger.

TINCTURE. The general designation for colors, metals, and furs in heraldry (q.v.).

TINCTURE OF OPIUM. See LAUDANUM.

TINDAL, MATTHEW (c.1653-1733). An English deistical writer. He was the son of a clergyman at Beer-Ferris, in Devonshire, was educated at Oxford, and elected fellow of All Souls College in 1678. After a brief lapse into Romanism during the reign of James II he reverted to Protestantism, or rather, as events showed, into rationalism. It was not till 1706 that he attracted particular notice, when the publication of his treatise on *The*

Rights of the Christian Church Asserted Against the Romish and All Other Priests Who Claim an Independent Power Over It raised a storm of opposition in England, but in Protestant circles on the Continent was highly praised. In 1730 he published his most celebrated treatise, entitled *Christianity as Old as the Creation, or The Gospel a Republication of the Religion of Nature*. The design of the work is to strip religion of the miraculous element, and to prove that its morality is its true and only claim to the reverence of mankind. Tindal's book is in excellent English and commanded much attention. Bishop Butler's *Analogy* was largely written as an answer to it. Consult Leslie Stephen, *History of English Thought in the Eighteenth Century* (3d ed., 2 vols., New York, 1902). See DESM.

TINDER. An inflammable material, usually made of half-burned linen. It was formerly one of the chief means of procuring fire before the introduction of friction matches. The tinder was made to catch the sparks caused by striking a piece of steel with a flint; and the ignited tinder enabled the operator to light a match dipped in sulphur. This was necessary, as tinder will not flame. Decaying wood—of willows and similar trees—also affords tinder; certain fungi furnish the German tinder, or amadou (q.v.).

TINEA (Lat., gnawing worm). A name given to several varieties of vegetable parasitic skin diseases. For *tinea favosa*, see **FAVUS**. *Tinea trichophytina* or ringworm may appear as an eruption on several parts of the body, receiving a modification of the name in each case, as *corporis*, *cruris*, *capitis*, *barbæ*, etc. It is common among the poorer classes, and spreads rapidly in schools and asylums. *Tinea* of the scalp often comes from indiscriminate use of towels, combs, and brushes. A red spot appears, marking the beginning of the eruption, which soon becomes scaly and enlarges, forming a ring possibly half an inch in diameter, leaving a clear centre. The margin of the circle is well defined, elevated, red, and covered with fine scales easily detachable. Mycelium and spores are seen in microscopical examination. There is seldom much irritation, except in cases where the crural fold or axilla is invaded. The *tinea trichophytina cruris* or *eczema marginatum* is not infrequent in the United States. In warm climates it is common and severe, and is known as Indian, Chinese, or Burmese ringworm, also as *Dhobie's itch*. Hyposulphite of soda, bichloride of mercury, acetate of copper, and tincture of iodine are frequently efficacious in the *tinea corporis* and *cruris*. Bulkley recommended sulphurous acid for the latter. *Tinea capitis*, also called *tinea tonsurans*, is very intractable, and the application of carbolic acid, green soap, mercury, oil of cade, etc., must be kept up, always in the form of an ointment. The X-ray is now extensively and successfully used to kill the mycelium. *Tinea versicolor*, or *Pityriasis versicolor*, is very common in warm countries, though also frequent in the United States. The front of the chest is most often attacked, the back next. The parasite *Microsporon furfur* is probably the cause of *tinea versicolor*. The treatment consists of frequent bathing with soap, hyposulphite of soda applications, or the use of mercurial preparations, salicylic acid, sulphur, and glycerin.

TINEIDÆ, tī-nē'ī-dē. See **LEAF MINER**.

TINEL, tē'nél', EDGAR (1854-1912). A Bel-

gian pianist and composer, born at Sinay. In 1863 he studied at the Brussels Conservatory, and (1873) received first prize for pianoforte and published four nocturnes for solo voice with piano. In 1877 his cantata *Klokke Roeland* won the Grand Prix. He succeeded Lemmens as director of the Institute for Sacred Music at Mechlin, in 1882, and in 1888 produced the oratorio *Franciscus*, which gave him fame. In 1889 he became inspector of the state music schools of Belgium, and in 1896 professor of counterpoint and fugue at Brussels Conservatory. He produced a *Grand Mass of the Holy Virgin of Lourdes* for five parts; *Te Deum* for four-part mixed choir with organ; *Alleluia* for four equal voices with the organ; the music drama *Godoleva* (1897); the sacred opera *Katharina* (1909); motets and sacred songs. He also published *Le chant grégorien, théorie sommaire de son exécution* (1895). Consult Van der Elst, *Edgar Tinel* (Ghent, 1901).

TINGHAI, tīng'hī'. Chief town of the island of Chusan (q.v.), Chekiang Province, China.

TINGITIDÆ, tīn-jīt'ī-dē. See **LACE BUG**.

TINGLEY, tīng'lē, KATHERINE (née WESTCOTT) (1852-). An American theosophist, born at Newburyport, Mass. In 1889 she was married to P. B. Tingley. After 1898, as leader and official head of the Universal Brotherhood, a theosophical organization which she had founded, she gained recognition as the successor of W. Q. Judge and Madame Blavatsky (qq.v.). She conducted theosophical crusades around the world in 1896-97 and 1904. The headquarters of the society were removed from New York to Point Loma, Cal., where Mrs. Tingley founded a colony that became noted. Here she established her School of Antiquity, a Raja Yoga Academy, and also an orphanage. During the Spanish-American War she was active in relief work. She became editor of a theosophical journal, the *Century Path*, and published: *The Mysteries of the Heart Doctrine* (1902); *A Nosegay of Everlastings* (1914); *Theosophy and Some of the Vital Problems of the Day* (1915). See **THEOSOPHICAL SOCIETY**.

TINGUAITE, tīn'gwā-īt (named from Sierra de Tingua, Brazil). An igneous rock of granular or porphyritic texture, characterized by the mineral combination alkali feldspar, nepheline, and ægerine, or ægerine augite. It is a rock of very limited distribution, but generally occurs in dikes associated with nepheline syenite, to which it is genetically and chemically related.

TINGUIAN, tīn'gī-ūn', or ITNEG, it-nēg'. A pagan mountain people of northwestern Luzon. Their stronghold is in the subprovince of Abra, but their settlements extend into the Ilocos provinces. They have domestic animals, extensive rice fields, and compact villages. Until recently the custom of head-hunting made loose federations among groups of villages necessary, and thus a number of dialect groups have sprung up.

The government is an oligarchy, the old men of each village constituting its ruling class. A peculiar but highly developed form of spiritualism, combined with an elaborate ceremonial, is found among them. An unorganized priesthood forms the medium through which the superior beings make known their wishes. Along the northern and western borders the people are skilled ironworkers, and their spears and head axes have a wide distribution throughout northwestern Luzon. Consult F. C. Cole, "The Tin-

guian," in *Philippine Journal of Science* (Manila, 1909). See PHILIPPINE ISLANDS.

TINKER BIRD, or **TINKER BARBET**. See COPPERSMITH.

TINKER'S ROOT. See FEVERWORT.

TINNÉ, tē'ná' (Athapascan, people). A collective term sometimes used as synonymous with Athapascan stock (q.v.), but more usually employed to designate the tribes of that stock residing in the Canadian northwest. See ATHAPASCAN STOCK.

TINNÉ, tin'ná, ALEXANDRINE (or ALEXINE) (1839-69). A Dutch explorer in Africa, born at The Hague. In 1856 she visited Palestine, Syria, and Egypt. She started for the Upper Nile in January, 1862, and reached Gondokoro in September, but was compelled by sickness to return to Khartum. In February, 1863, she set out with an enormous train on a second expedition, with Bahr-el-Ghazal for its goal, in which Heuglin and Steudner participated and which advanced as far as Dembo in the Bongo country. Steudner and Miss Tinné's mother having succumbed to the climate, the expedition returned to Khartum in March, 1864. Its results were described in the *Transactions of the Historical Society of Lancashire, etc.*, vol. xvi (Liverpool, 1864). In 1865 Alexine Tinné visited Crete, Greece, and Italy, went to Algiers in 1866, traveled through the French Sahara in 1868, and in January, 1869, started with a strong retinue for the interior, intending to penetrate to the Nile via Bornu. Detained by sickness at Murzuk, she then proceeded towards Ghat by invitation of the Tuareg chief Ikhenukhen, but was assassinated by the Tuaregs escorting her, on August 1. Consult Heuglin, *Die Tinnésche Expedition im westlichen Nilgebiet, 1863-64* (Gotha, 1865), and id., *Reise in das Gebiet des Weissen Nil, etc.* (Leipzig, 1869).

TINNEVELLI, tin't-vél'i, or **TINAVELLY**. The capital of a district of Madras, British India, 99 miles southwest of Madura, on the left bank of the Tambraparni River (Map: India, C 8). It is connected with Palamcottah on the opposite bank by a handsome bridge. The most striking edifice is the Siva temple. There are two colleges, and the town has long been an important centre for Protestant missions. Cotton goods are extensively manufactured. Tinneveli became a British possession in 1801. Pop., 1901, 40,469; 1911, 43,741.

TINNI'TUS AURIUM (Lat., ringing of the ears). Ringing in the ears. In most cases it is an unimportant symptom, depending on some local temporary affection of the ear, or on some disturbance of the digestive system; but as it is also a common symptom of organic disease of the auditory nerve, it may indicate a dangerous condition, or may be a prelude to complete deafness. It may be a symptom of neurasthenia (q.v.), and may occur in a number of diseases. Hence it is a symptom that, especially if permanent, must be carefully watched. It may be induced for a few hours by a large dose of quinine or of the salicylates.

TINOCERAS. A huge proboscidean, allied to *Coryphodon*, *Dinoceras*, and *Uintatherium*, found fossil in the Middle Eocene (Bridges) formations of Wyoming. Its most prominent characteristic was the long, narrow, somewhat quadrangular skull, bearing six great protuberances, one pair on the nasal bones pointing forward, a second outward-bending pair on the upper jawbones (maxillaries), and a third over

the eyes (on the parietals), where there was a semicircular upright crest of bone. These protuberances seem not to have been covered with ordinary horn. The typical species is *Tinoceras ingens*, described by O. C. Marsh, *Dinocerata: A Monograph of an Extinct Order of Gigantic Mammals* (Washington, 1884).

TINOS, tē'nós. One of the Cyclades. See TENOS.

TIN PYRITES. See STANNITE.

TINSEAU, tăn'sō', LÉON, COUNT DE (1842-). A French novelist, born at Autun. He wrote many popular and ably written novels which show especial skill in development of plot. Among them are: *Robert d'Epirien* (1882); *La meilleure part* (1884), crowned by the French Academy; *Bouche close* (1889); *Plus fort que la haine* (1891); *Mensonge blanc* (1900); *La princesse errante* (1903); *Les étourderies de la chanoinesse* (1906); *La deuxième page* (1914).

TINSTONE. See CASSITERITE.

TINT'ERN ABBEY. A beautiful monastic ruin in England, in a meadow on the west bank of the River Wye, 9 miles below Monmouth. Theodoric, British King of Glamorgan, was said to have fallen in battle against the heathen Saxons here, 600 A.D. The abbey was founded in 1131 for Cistercian monks by Walter de Clare; the church was begun a century later through the munificence of Roger de Bigod, Earl Marshal, and dedicated in 1268. The tower and roof are gone; but the church remains a fine example of the Decorated style—the English High Gothic—beautiful in composition and delicate in execution. The nave is 228 feet long, the transept 150, and the width of nave and choir 37 feet. The ruins of the convent buildings also remain. Tintern Abbey is well known through Wordsworth's poem.

TINTORETTO, IL (1518-94). The name usually applied to Jacopo Robusti, one of the chief masters of the High Renaissance in Venice. He was born at Venice, the son of a dyer (*tintore*), whence his name, and at an early age was placed with Titian. According to the traditional account, Titian's jealousy soon forced him to leave; but their separation was probably due to Tintoretto's point of view, which saw in the plastic rendition of the human body in action, rather than in color, the chief problem of art. Taking an independent atelier, he subjected himself to a severe course of training. Following his great aim, as announced in the motto upon the wall of his studio, to unite Michelangelo's design with Titian's color, he drew constantly from casts of the former's sculptures. He dissected bodies to learn anatomy, studied foreshortening and movement from suspended figures, worked by day and lamplight for chiaroscuro, and even learned from house painters the secrets of their craft. Besides the color of Titian he studied the work of his friend Schiavone, from whom he acquired the technique of fresco, and also with Bonifazio Veronese, Berenson believes.

After such preparation his eagerness for activity led him to solicit work at low prices. His earliest paintings, which are rare, show also the influence of Giorgione in color and landscape. The first to attract attention was a lost portrait of his brother and himself with night effect, but the most important surviving example is a "Circumcision" in Santa Maria del Carmine. Later he painted five subjects from Genesis for Santa Trinità, two of which, the "Fall" and

the "Murder of Abel," are preserved in the Venetian Academy, the former especially being idyllic in sentiment, and almost equal to Titian in color. After a number of façades, none of which survive, his next work of importance was the decorations of the choir of the Madonna del Orto, 50 feet in height, with a "Last Judgment" and other subjects. To the same period belong the startlingly original "Crucifixion" in San Cassiano, Venice. Finally, Tintoretto's reputation was definitely established by the series of pictures in the Scuola di San Marco describing abduction of the body of the patron saint of Venice from Alexandria to Venice. The episodes represented the "Finding of the Body" (Brera, Milan), its "Abduction from Alexandria," "St. Mark Saving a Saracen from Shipwreck" (both in the Royal Palace, Venice), and "Miracle of St. Mark" (Academy, Venice). All show Tintoretto at his best, especially the last, which so good a critic as Taine esteemed the greatest painting in Italy. It is remarkable for intense dramatic action and for the treatment of the light which issues from the saint's head and shoulders, lending rich color to the well modeled groups.

Tintoretto seldom dated his works, and there is no record of his activity between 1550 and 1560. It is probable that during this period he painted a large number of his easel pieces, and perhaps the three grand compositions in the Ducal Palace, which were burnt in 1577. In 1560 began his remarkable activity for the guild of San Rocco, whose scuola (guild house) forms a perfect museum of his works, of which it and the adjoining church contain 56 in all, painted at different periods of his life. In 1565 he finished the "Crucifixion," a splendid piece of naturalism, and one of his very best works; in 1577 the two panels of the ceiling of the great hall: the "Paschal Feast" and "Moses Striking the Rock." Meanwhile he had become a member of the guild, and in 1577 he was employed at a salary of 100 ducats to furnish three pictures a year—fulfilling this until his death. Among the best are a series from the life of Christ, including a strikingly original "Visitation," "Annunciation," "Christ Before Pilate," "Christ Bearing His Cross," "Ecce Homo," and a "Resurrection."

In the decorations of the Ducal Palace, begun about the same time (1560), he was extensively aided by pupils, especially by his son Domenico. In the Sala del Scrutinio he painted the "Capture of Zara"; in the Antecollegio, four charming mythological representations: "Bacchus, Ariadne, and Venus," "Mercury and the Graces," "Minerva Expelling Mars," and the "Forge of Vulcan"; in the Sala del Collegio, four votive pictures of doges, the finest of which represents the "Marriage of St. Catharine"; and in the Hall of the Senate, "Venice, Queen of the Seas." In the Hall of the Grand Council the Doge and Senate offer the spoils of the conquered cities to "Venice in Glory," and the four battle pieces of the ceiling show keenest effects of foreshortening. There, too, a whole wall is occupied by his last great work, the "Paradise," 74 by 30 feet, the largest oil painting in the world, but which has suffered much from the ravages of time and restoration.

His altarpieces and easel pictures are legion, and may be found in the churches of Venice and principal galleries of Europe. We can mention only the three fine examples in San

Giorgio Maggiore; "Susanna's Bath," in Vienna, Paris, and Madrid; "Vulcan, Cupid, and Venus" (Pitti, Florence); "Abraham's Sacrifice" (Uffizi); "Origin of the Milky Way" and "St. George and the Dragon" (National Gallery, London); "Luna and the Hours" (Berlin); and "Christ Visiting Mary and Martha" (Augsburg), one of his loveliest works. The Metropolitan Museum, New York, possesses "Doge in Prayer before the Redeemer" and the large "Miracle of the Loaves and Fishes." During the same period he also designed for St. Mark's Church a series of mosaics of subjects from the life of Christ.

Tintoretto shared with Titian the reputation of being the greatest portraitist of his day. His early portraits, indeed, are often confounded with Titian's, but he soon developed a highly individual style, characterized by naturalism and simplicity. Eliminating all incident, even gesture, the great painter of movement produced likenesses in the highest sense typical. With incredible rapidity he painted the doges and the nobility who were his sitters. Of these portraits over 100 survive; there are important examples which we knew were lost, but many of which were probably executed by his son, Domenico. Among the best are his own likeness in the Louvre and in the Uffizi; Vincenzo Morosini, Paolo Paruto, Tomaso Contarini, and Niccolò Priuli, in the Ducal Palace; the doges Trevisan and Priuli, Jacopo Soranzo, Andrea Dandolo, and Antonio Capello, in the Academy of Vienna; the Doge Niccolò da Ponte Sebastiano Venier, the hero of Lepanto, a "Young General"; a number of admirable unknown portraits, in the Vienna Gallery; "Two Brothers," a fine psychological study of two boys; and a "Senator," Gardner collection, Boston.

The adverse opinion of some critics upon Tintoretto's works is due to the effect of time upon them. He used a dark ground and applied the colors but lightly, with the result that they have greatly darkened. His rapidity of execution often impelled him to do work which was sketchy, sometimes even negligent; but in his best work he shows himself one of the greatest painters of all times. He was, in a way, the culmination of Renaissance painting, and united in himself more than did any other man all its different tendencies. Tintoretto extended the plastic character to the entire composition, and Titian's color harmony of flat surfaces became with him a light symphony of the whole painting. By his mastery of light and shadow he was enabled to put a world of poetry and sentiment in his pictures, without degenerating into illustration. He had a wonderful fertility of imagination. His most startling innovations, however, were in composition; for the problem is far more difficult in Tintoretto's plastic work than in the relief-like productions of others. Sometimes he separated foreground and background, using the action in the latter to concentrate attention on the principal action in the foreground. In dramatic power he is the worthy compeer of Michelangelo, and like him he indicated emotion by the action of the body.

Excepting a year's stay at Mantua, Tintoretto passed all of his life at Venice. Before 1560 he married Faustina dei Vescovi, who seemed to have her share of worry in taking care of her spouse, who was impracticable in money matters. Of his eight children, MARIETTA, the

eldest, a gifted artist and his favorite child, met with an early death in 1590, whence the beautiful tradition of the old painter painting his dead daughter. He did not long survive her, and died at Venice, May 31, 1594. His son and assistant DOMENICO painted many works in superficial imitation of his father.

Bibliography. The chief literary source for Tintoretto's life is Ridolfi, *Meraviglie dell' arte* (Venice, 1648). The first among modern writers to establish his fame was Ruskin in *Stones of Venice* and other works. Consult also: Giorgio Vasari, *Lives of the Most Eminent Painters, Sculptors, and Architects*, Eng. trans. by Blashfield and Hopkins, vol. iii (New York, 1896); F. P. Stearns, *Four Great Venetians* (ib., 1901); Henry Thode, "Tintoretto," in *Künstler Monographien*, No. 49 (Bielefeld, 1901); *Masters in Art*, vol. iii (Boston, 1902), containing an exhaustive bibliography; J. B. Stoughton Holborn, *Jacopo Robusti called Tintoretto*, in "Great Masters in Painting and Sculpture" (London, 1903); S. L. Bensusan, *Tintoretto* (ib., 1907); E. M. Philipps, *Tintoretto* (New York, 1911); F. P. B. Osmaston, *Art and Genius of Tintoret* (2 vols., ib., 1915).

TINTYPE. See FERROTTYPE.

TIN WEDDING. See WEDDING ANNIVERSARIES.

TINY TIM. In Dickens's *Christmas Carol*, a cripple, the little son of Bob Cratchit.

TIORBA, tē-ōr-bā, DELLA. See FERRARI, BENEDETTO.

TIPPECANOE, tip'pē-kā-nōō'. A popular nickname of Gen. William Henry Harrison, due to his victory over the Indians at the Tippecanoe River in 1811.

TIPPECANOE, BATTLE OF. An engagement fought on Nov. 7, 1811, near the site of the present village of Battle Ground, on the Tippecanoe River, in Tippecanoe Co., Ind., between an American force of about 800, including 500 Indiana and Kentucky militiamen, under William Henry Harrison, then Governor of Indiana Territory, and an Indian force, estimated by Harrison at about 6000, but probably much smaller, under the actual command of White Loon, Stone Eater, and Winnemac. On Oct. 11, 1811, while Harrison was building a stockade on the site of Terre Haute, one of his sentinels was killed from ambush, and Harrison, considering this the beginning of hostilities, soon afterward marched against the town on the Tippecanoe, where the Prophet, a brother of Tecumseh (q.v.), was supposed to be inciting the Indians to attack the whites because of the alienation of Indian lands. On the night of November 6 he encamped within about a mile of the town, and posted his troops in the form of a triangle, having previously arranged with the Prophet for a conference on the following day. Before dawn on the 7th the Indians attacked the camp with great ferocity and bravery, but after more than two hours of stubborn fighting were driven from the field. On the following day Harrison advanced to the town, found it deserted, and almost completely destroyed it. He then returned to Vincennes. The loss of the whites in the battle in killed and wounded was about 190, of whom 34 were officers; that of the Indians, though undoubtedly large, is not definitely known. The battle rendered virtually impossible the realization of Tecumseh's plans, weakened and almost destroyed the prestige of the Prophet, hastened the general outbreak of

hostilities by the Indians against the Americans in the Northwest, and greatly enhanced the reputation of General Harrison, who later, partly on the strength of this success, was placed in command of the American troops in the West. A full account of the Tippecanoe expedition is given in Harrison's report to the Secretary of War, November, 1811.

TIPPERARY. An inland county of the Province of Munster, Ireland, lying north of Waterford (Map: Ireland, D 6). Area, 1659 square miles. The county for the most part is in the basin of the river Suir. Other rivers are the Shannon, the Nore, the Nenagh, and the Brosna; lakes are numerous, but of small size. The surface is generally level. The Galtees Mountains which diversify it are rather groups than portions of any connected range; these mountains rise to 3000 feet. The soil of the plain is fertile; there is a considerable amount of bog in the central and eastern districts. The mineral productions are coal (anthracite), copper, and lead, also zinc and good fire clay; slates of an excellent quality are quarried near Killaloe. Wheat was formerly grown in large quantities, but of late years its cultivation has been superseded by dairy farming and the raising of cattle. Pop., 1901, 160,232; 1911, 151,951.

TIPPERARY. The capital of Tipperary County, Ireland, on the Arra, 111 miles southwest of Dublin (Map: Ireland, C 7). It occupies a central position in a fine country, and carries on an extensive trade in butter and condensed milk. The town, of ancient origin, is well built, and contains Roman Catholic and Protestant churches, national schools, and a school of the Erasmus Smith endowment. In 1890 the foundation of a New Tipperary, now in ruins, was an attempt, under the Irish League's plan of campaign, to boycott the land proprietor of the old town. It proved abortive within a year. Pop., 1901, 6281; 1911, 5974.

TIPPLE, tip'pl, EZRA SQUIER (1861-). An American Methodist Episcopal clergyman and educator, born at Camden, N. Y. He graduated from Syracuse University in 1884 and from Drew Theological Seminary in 1887, taking his Ph.D. at Syracuse the same year. Afterward he held various pastorates in New York City. In 1905 he was elected professor of practical theology and in 1912 president of Drew Theological Seminary. Besides several series of *Drew Sermons*, he published: *The Heart of Asbury's Journal* (1905); *The Minister of God* (1906); *The Life of Freeborn Garrettson* (1910); *Some Famous Country Parishes* (1911); *Francis Asbury* (1916).

TIPPU SAHIB, tē-pōō' sā'hīb (1751-99). Sultan of Mysore, in India. He was a son of Hyder Ali (q.v.). He was actively engaged in the wars of his father, and routed the British at Perimbakum (Sept. 10, 1780), and on the banks of the Kolerun in Tanjore (Feb. 18, 1782). On the death of his father in 1782 he was crowned Sultan. On April 28, 1783, he captured and put to death the garrison of Bednore. The peace between England and France deprived him of his French allies and he made a treaty in 1784 on the basis of the status quo. He then gave his attention to the internal affairs of Mysore, establishing a splendid court at Seringapatam. He sought, in 1787, to bring on a renewal of the war between France and England, and failing, invaded in 1790 the

protected state of Travancore. In the ensuing war (1790-92) the British, under Colonel Stuart and Lord Cornwallis, were aided by the Maharattas and the Nizam, who joined in the struggle against their powerful neighbor both out of fear and religious hatred, Tippu being a fanatical Mohammedan. The Sultan laid waste the Carnatic and advanced almost to the gates of Madras, but was defeated near Seringapatam in March, 1792, and compelled to cede one-half of his dominions. Hostilities began again in March, 1799, and two months afterward Tippu was driven from the open field and attacked in his capital of Seringapatam, which was stormed on May 4, the Sultan himself being slain after an heroic resistance. His dominions and property were confiscated, a portion of Mysore, however, being assigned to the Nizam. Consult L. B. Bowring, *Haidar Ali and Tipu Sultan* (London, 1893).

TIP/TON. A town in South Staffordshire, England, $4\frac{1}{2}$ miles southeast of Wolverhampton, with collieries, blast furnaces, and iron manufactures. Pop., 1901, 30,543; 1911, 31,756.

TIPTON. A city and the county seat of Tipton Co., Ind., 40 miles north by east of Indianapolis, on the Lake Erie and Western Railroad (Map: Indiana, E 4). It is the trade centre of an agricultural and stock-raising district. The manufactures are canned vegetables, catsup, brooms, cutlery, and shoes. It was settled in 1844 and incorporated 10 years later. Pop., 1900, 3764; 1910, 4075.

TIPU/LIDÆ. See CRANE FLY.

TIPWORM. The larva of one of the gall midges (*Oecidomyia oayococana*), which occurs in the terminal buds of the cranberry plant and causes them to become unusually prominent and to stop the development of the leaves. After attack the tip usually dies. The adult fly has a red abdomen and a grayish thorax, and is about one-sixteenth of an inch in length. The female has a long, extensible ovipositor by means of which she thrusts her eggs into the heart of the young shoot. See also FLY INSECTS.

TIRABOSCHI, tē-rā-bōs'kē, GIROLAMO (1731-94). An erudite Italian, born at Bergamo, author of a monumental and still useful *Storia della letteratura italiana* (1772-81, in 14 vols.), of which translations have appeared in French and German. Other works: *Vetera Humiliatorum monumenta* (1766), *Biblioteca modenese* (1781-86), and *Memorie storiche modenesi* (1793).

TIRARD, tē-rār', PIERRE EMMANUEL (1827-93). A French statesman, born at Geneva. He went to Paris about 1846, and in 1870 became mayor of the Second Arrondissement. In 1876 he entered the Chamber of Deputies as a radical Republican and he was successively Minister of Agriculture and Commerce (1879-81 and in 1882), Minister of Finance (1882-85), and Premier (1887-88 and 1889-90). Subsequently he resumed the seat in the Senate to which he had been elected in 1883. From December, 1892, to April, 1893, he was Minister of Finance.

TIRASPOL, tē-rās'pol. A town in the Government of Kherson, South Russia, on the left bank of the Dniester, 73 miles by rail northwest of Odessa (Map: Russia, C 5). It manufactures flour, brick, pottery, and ironware, and has a large trade. Pop., 1900, 29,323; 1910, 35,242.

TIREE, ti-rē', or TYREE. A Scottish island, one of the Inner Hebrides (q.v.), included in Argyllshire, 20 miles northwest of Iona (Map:

Scotland, A 3). It is 13 miles long and over 6 miles in extreme breadth. There are interesting antiquities. The inhabitants support themselves by rearing cattle, fishing, and exporting poultry and eggs. Pop., 1901, 2195; 1911, 2306.

TIREH, tē're. A town of the Turkish Vilayet of Smyrna, Asia Minor, 25 miles southeast of the city of Smyrna, with which it has railway connection (Map: Turkey in Asia, B 3). It is the ancient Tyrrha of the Kingdom of Lydia. Tapestry and cotton manufacturing constitute the chief industries. Pop., estimated at from 13,000 to 20,000.

TIRE'SIAS (Lat., from Gk. *Teiresias, Teiresias*). In Greek legend, a famous Theban seer. He is called son of Eueres and Chariclo, and was blind from early youth, because he had seen Athena bathing. To recompense him for his loss of sight, the goddess gave him power to understand the voices of birds. Another legend represents Hera as depriving him of his sight because, being made arbiter in a dispute between her and Zeus, he had decided in favor of the latter; Zeus as a compensation gave him unerring power in interpreting omens, and prolonged life. He appears prominently in the Theban cycle of legends. In the *Odyssey* (book xi) it is recorded that Odysseus went to the lower world to consult him.

TIRHAKAH, tēr-hā'kā. A king of ancient Ethiopia. See TAHARKA.

TIRLEMONT, tērl'mōn' (Flem. *Tienen* or *Thienen*). A town in the Province of Brabant, Belgium, 20 miles east by south of Brussels, on the Geete River (Map: Belgium, C 4). Its walls, which had a circumference of about 6 miles, were dismantled early in the nineteenth century. The chief objects of interest are the restored churches of St. Germain and Notre Dame du Lac. The former is a composite of the Romanesque and early Gothic, and was begun in the ninth century. Its most striking feature is the altarpiece by Wappers. The church of Notre Dame du Lac dates partly from the thirteenth and partly from the fifteenth century. There are manufactures of engines, leather, cotton and woolen goods, etc. The town was occupied by the Germans in 1914. See WAR IN EUROPE. Pop., 1900, 17,855; 1910, 17,581.

TIRNAU. See TYRNAU.

TIRNOVA, tēr'nō-vā (Bulgarian *Trnova*). A district town in Bulgaria, 124 miles northeast of Sofia (Map: Balkan Peninsula, E 3). It contains a number of mediæval churches. The chief industries are dyeing and the manufacture of copper ware. Tirnova was the capital of Bulgaria for about two centuries until 1393, when it was taken by the Turks. It was in Tirnova on Oct. 5, 1908, that Prince Ferdinand of Bulgaria solemnly proclaimed the complete independence of his country and assumed the title of King. Pop., 1905, 12,171.

TIRO, MARCUS TULLIUS. Slave, pupil, and subsequently amanuensis of Cicero, whose life he wrote and whose letters he collected. He is known chiefly as the inventor of the ancient stenography (see SHORTHAND), called after him *Notæ Tironæ*.

TIR/OL, or TYR/OL, Ger. pron. tē-röl'. A Crownland of Austria, united with Vorarlberg under one administration (Map: Austria, B 3). Area about 10,305 square miles. Tirol like Switzerland is almost entirely covered by the Alps. It lacks lakes, however, the Lago di Garda on the south frontier being the only

important one. Through the north extends the valley of the Inn, with the Lech Alps on the northwest. The Inn is the most important river in the crownland. It becomes navigable at Hall, just below Innsbruck. The watershed in Tirol between the Danube and the Po, separating northern from southern Tirol, is formed by the Oetzthal Alps on the west (reaching about 12,500 feet) and by the Zillerthal Alps towards the east. The Brenner Pass connecting Innsbruck with Verona, Italy, by an elevation of only 4500 feet lies between and marks the chief depression of the divide. In the Zillerthal group rises the Drave. It flows through the Pusterthal, and leaves Tirol on the extreme eastern boundary. The south end of Tirol is mainly occupied by the valley of the Adige, with the remarkable Dolomite Alps on the east. The Adige flows south and enters Italy west of the Lessinian Alps, which line the Italian frontier. The Sarnthal Alps lie in the centre of Tirol, at the eastern foot of the Oetzthal Alps. The Hohe Tauern (with the Gross Glockner peak, about 12,500 feet) forms the northeastern boundary, the Kitzbühl Alps lie on the Salzburg border, and the Ortler group enters from the southwest and forms the loftiest elevation in Tirol—12,790 feet. The mountains of Tirol are famous for their picturesque valleys. The climate is of great variety. The north slopes, as the Inn valley, are raw and cold, but the southern slopes, especially the Adige valley, are warm in summer.

Tirol is in general little adapted to tillage, the better portions being devoted mainly to meadows. About two-thirds of the surface is covered with forests. The agricultural sections are in the valleys in the northern and southern districts. Southern Tirol is noted for its wine, and it grows much fruit. Zinc and sulphur are mined; also some coal, iron, and copper. The industries are not extensive. Cotton goods are produced in the Inn Valley and silk goods in the Adige district. Spinning and weaving as house industries are conspicuous. The wood carving is famous. Carpets, iron wares, and marble are shipped, as well as cattle, lumber, and cheese.

There is a university at the capital, Innsbruck (1340 students in 1912). Tirol has a Diet of 68 members—34 representing the rural communities, 13 the towns, and 10 the landed aristocracy, the principal ecclesiastical dignitaries having seats in the body. The Statthalter in Innsbruck is at the head of the administration for Tirol and Vorarlberg, but Vorarlberg has its own Constitution and Diet. Tirol sends 25 members to the Lower House of the Austrian Reichsrat. The population in 1910 was 946,613, of whom the vernacular of 57.3 per cent was German and of 42 per cent Italian or Ladin. Over 99 per cent are Roman Catholic.

History. In Roman times Tirol formed part of Rætia, which was conquered by the Romans, 14 B.C. At the time of the great migration of nations it was overrun by various German tribes, including the Ostrogoths. The southern portion later fell into the hands of the Lombards, and the northern became subject to the Bavarians, who were subdued by the Franks. Ultimately the country was divided into a number of petty lordships, some under the suzerainty of the dukes of Bavaria, some under that of the bishops of Trent, and others under that of the bishops of Brixen. The whole of German

Tirol finally came into possession of one family, the counts of the Adige or of Tirol (the latter being the name of their castle, so called from the Roman Teriolis, near the site of which it stood). The last count, who died in 1335, left one daughter, Margaret Maultasch. She bequeathed her rights to her cousins, the dukes of Austria, who thus acquired possession of Tirol in 1363. The Italian slope remained in possession of the bishops of Trent, who were dispossessed in 1803. By the Treaty of Pressburg in 1805 Tirol was ceded to Bavaria, much to the discontent of the people, who were warmly attached to the house of Austria. They made a gallant resistance to the French in 1809, under Andreas Hofer (q.v.), but were defeated. Tirol was restored to Austria by the Treaty of Paris in 1814. The acquisition of Italian Tirol forms part of the programme of the Italian irredentists. Tirol was invaded by the Italians in the great war which began in 1914. See WAR IN EUROPE; IRREDENTISM.

Bibliography. General description: Schneller, *Landeskunde von Tirol* (Innsbruck, 1872); R. H. Busk, *The Valleys of Tirol* (London, 1874); W. A. History: Huber, *Geschichte der Vereinigung Tirols mit Oesterreich* (Innsbruck, 1864); Josef Egger, *Geschichte Tirols von der ältesten Zeiten bis in die Neuzeit* (3 vols., ib., 1872-80); id., *Die österreichisch-ungarische Monarchie in Wort und Bild*, vol. xiii (Vienna, 1893).

TIRPITZ, ALFRED VON (1849-). A German naval officer, born at Küstrin. He became a cadet in the Prussian navy in 1865, attended the Marineakademie in 1874-76, and rose through the grades to be admiral (1903). He commanded a cruiser division on the East Asia station in 1896-97, became Secretary of State of the Imperial navy, and plenipotentiary to the Bundesrat in 1897, and from the following year served also as Prussian Minister of State. Tirpitz was ennobled in 1900, and received the following orders: Black Eagle (1907), House of Hohenzollern, and Pour le Mérite (1915). In 1911 he was created Lord High Admiral of the Imperial navy. During the great war which broke out in 1914, he was prominent because, in his official capacity, he declared a war zone about the British Isles, within which vessels, neutral as well as belligerent, would sail at their own risk. To mark the zone he instituted a submarine blockade, a novelty in naval warfare. As the outcome of this policy, many belligerent and neutral vessels were destroyed by submarines, one of the most spectacular catastrophes being the sinking of the *Lusitania* (q.v.). The loss of American lives on such vessels severely strained the relations between Germany and the United States. Von Tirpitz retired in March, 1916, ill health being the reason given. See WAR IN EUROPE.

TIRSO DE MOLINA, tēr'sō dā mō-lē'nā. See TELLEZ, GABRIEL.

TIRURAY, tēr'ūr-rī'. A Malay people found near the mouth of the Cottabato River in southwestern Mindanao. At the time of the Spanish conquest this tribe was very powerful, but later

suffered so greatly from the slave raids of the Moro that they are now only a miserable remnant of the original population. See PHILIPPINE ISLANDS.

TIRYNS (Lat., from Gk. *Tírυνs*). An ancient city of Argolis, in the Peloponnese, south-east of Argos, near the head of the Argolic gulf, not far from Nauplia (Map: Greece, Ancient, C 3). According to tradition it was founded by Prætus, a mythic king of Argolis; and its massive walls, like other rude massive structures in Greece of unknown antiquity, were reputed to be the work of the Cyclopes (see CYCLOPEAN ARCHITECTURE). Later, Perseus was said to have ruled here, and Hercules resided there while in servitude to Eurystheus. At the time of the Dorian conquest Argos seems to have secured the supremacy over the plain, though during the Persian wars Tiryns was independent and sent troops to Plataea. Some time later, probably about 468 B.C., the city was taken by the Argives; after this period Tiryns remained uninhabited, the walls of the citadel only being left standing, the wonder and admiration of later ages. The acropolis or citadel of Tiryns was built on the summit of a low, flat, rocky hill, about 980 by 330 feet in extent, which rises abruptly out of the dead level of the plain of Argos to a height of from 30 to 60 feet. It consists of three terraces, of which the highest was occupied by a prehistoric palace, the middle by lesser buildings, while the lowest has been scarcely explored, but seems to have contained only small structures. This hill was surrounded by a massive wall of huge blocks of limestone of irregular shape laid in a clay mortar. The original height is uncertain; in some places the wall is still nearly 25 feet high. The thickness around the lower terrace is not quite uniform, but does not exceed 26 feet; around the upper terrace it varies from 16 to the prodigious figure of 57 feet. A part of this wall was occupied by galleries and chambers, probably meant for the storing of provisions. The main entrance was on the east, and was reached by a ramp; on the west was a postern gate with a stairway in the rock. The palace on the summit was excavated by Schliemann and Dörpfeld in 1884-85, and until the recent discoveries in Crete was the most complete example of the home of a Mycenaean king. After passing the entrance gate the way leads to a large propylæa, which opens into a great open court; from this a second gateway leads to another paved court (*αὐλή*, *aulê*), surrounded by colonnades. On one side low steps and a door lead to a vestibule, which again opens into the great hall (*μέγαρον*, *megaron*), with a circular hearth in the centre. Around this central structure is a complex of passages and lesser rooms, including a bath and a smaller court with its own megaron, probably the women's apartments. The essential identity of this palace with that described in the Homeric poems lends peculiar interest to the discovery. Recent excavations have shown another palace beneath the one described above.

(London, 1886); Schuchhardt, *Schliemann's Excavations*, Eng. trans. by Eugénie Sellers (ib., 1891); Perrot and Chipiez, *Histoire de l'art dans l'antiquité*, vol. vi (Paris, 1894); Tsountas and Manatt, *The Mycenaean Age* (London, 1897); K. Baedeker, *Greece* (4th Eng. ed., Leipzig, 1909); and the article

"Archæology," in the *NEW INTERNATIONAL YEAR BOOK* for 1913, p. 52 (New York, 1914).

TISCHBEIN, tish'bîn. A German family of artists who lived in Hesse during the eighteenth century. JOHANN HEINRICH, the ELDER (1733-89), a painter, born at Haina, studied first in Cassel, then under Van Loo, Boucher, and Watteau in Paris, and finally under Piazzetta in Venice. Returning to Cassel in 1754 he became court painter to the Landgrave and director of the New Academy (1776). His historical pictures and portraits in the style of the French eighteenth-century masters are well drawn, though affected, and rank among the best works of the time in Germany. Examples are: "Lessing" (Berlin) and Landgrave Frederick II (Cassel).—JOHANN FRIEDRICH AUGUST (1750-1812), also a painter, nephew of the preceding, was born in Maestricht. He studied with his uncle and in Paris and Italy. Afterward he became court painter in Waldeck and then director of the Leipzig Academy (1800). He was one of the finest colorists of his day. His canvases include nine pastel portraits of princes and princesses of Orange-Nassau (Amsterdam), and portraits of Schiller (1804; Leipzig), Wieland, and Mozart.—JOHANN HEINRICH WILHELM, the ELDER (1751-1829), a painter and etcher, also known as the Neapolitan, cousin of the preceding, was the most celebrated of the family, though artistically the least gifted. He was born at Haina and studied with his uncle, Johann Heinrich, and in Hamburg, Bremen, and Holland. In 1779 he went to Italy, where he became intimate with Goethe, whom he accompanied to Naples. From 1789 to 1799 he was director of the Naples Academy. In 1809 he was made court painter to the Duke of Oldenburg. He was one of the chief representatives in Germany of the school of David. Among his paintings are a portrait of Goethe in the Campagna (Frankfurt) and 43 "Idyls" (Oldenburg). He issued about 150 etchings and engravings in connection with various publications. Consult: Michel, *Etude biographique sur les Tischbeins* (Lyons, 1881); Franz Landberger, *Wilhelm Tischbein* (Leipzig, 1908); Wolfgang Soerrensens, *Johann Heinrich Wilhelm Tischbein: sein Leben und seine Kunst* (Berlin, 1910); Hermann Bahlmann, *J. H. Tischbein* (Strassburg, 1911).

TISCHENDORF, tish'en-dôrf, KONSTANTIN VON (1815-74). One of the most eminent textual critics and paleographers of the nineteenth century, born at Lengenfeld, Saxony. In 1840, as a privatdocent at Leipzig, he published his first edition of the Greek New Testament (dated 1841), and then went to Paris, where for over two years he labored incessantly among the manuscript treasures of the National Library. In 1842 the decipherment and publication of the Greek text of the important palimpsest Codex Ephraemi, followed soon after by his edition of the Codex Claromontanus, marked him as a textual scholar of the first rank. Though he became a professor of theology at Leipzig, the greater part of his time was spent in journeys in search of biblical manuscripts, and in editing and publishing the same, or in work on successive editions of the Greek New Testament. He discovered in 1844, at the monastery of St. Catharine at Mount Sinai, a few leaves of a manuscript of the Greek Old Testament. Fifteen years later, on a third visit, he discovered the remainder of the manuscript, the famous *Codex*

Sinaiticus, containing both the Old and New Testaments, one of the two oldest-known manuscripts of the Greek Bible. The crowning work of Tischendorf's life was his eighth edition (1865-72) of the Greek Testament with its large critical apparatus, the indispensable vademecum of every student of the text of the New Testament. A list of Tischendorf's numerous publications may be found, with a sketch of his career, in the *Prolegomena* to the eighth edition by Dr. C. R. Gregory (Leipzig, 1884-04).

TISHRI, tish'rē. A month in the Babylonian, Persian, and Jewish calendars corresponding to the Seleucid *Hyperboretaios*, September-October. The Babylonian name *tish-ri-tum* is regarded as derived from *shurru*, to begin, to dedicate, the civil year having begun in the autumn with this month, while the ecclesiastical year seems to have begun in the spring with the month of Nisan. Tishri is not mentioned in the Bible, but the name is found in the Mishna treatise *Shekalim*, iii, 1, and probably in Josephus, *Antiquities*, viii, 4, 1. The Jewish civil year begins with the month of Tishri. See I. Benzinger, *Hebräische Archäologie* (2d ed., Tübingen, 1907).

TIS'TAS (Lat., from Gk. *Teiolas*, *Teisias*). A Greek rhetorician of Syracuse, teacher at Athens, of Gorgias (q.v.), Lysias (q.v.), and Isocrates (q.v.), and author of a manual on rhetoric. Consult: F. W. Blass, *Die attische Beredsamkeit*, vol. i (2d ed., Leipzig, 1887); R. C. Jebb, *The Attic Orators from Antiphon to Isæos* (2 vols., London, 1876); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i, part i (6th ed., Munich, 1912).

TISIO, tē'zē-ō, **BENVENUTO**. See GAROFALO.

TISSAPHERNES, tis'sā-fēr'nēz (Lat., from Gk. *Τισσαφέρνης*, from OPers. **Cithrafarnā*, possessed of manifold glory) (?-305 B.C.). A Persian, appointed satrap of the coast lands of Asia Minor by Darius II in 414 B.C. He played a part by intrigue and arms in the Peloponnesian War. He became the jealous rival of Cyrus the Younger on the latter's arrival in Asia Minor in 407 B.C., and when it became manifest that Cyrus was plotting against his brother, King Artaxerxes II, and aiming at the throne, Tissaphernes was the first to inform the King of the impending danger. He held a command in the Persian army and distinguished himself at the battle of Cunaxa (q.v.). After the death of Cyrus he entrapped the generals of the Greek mercenaries of Cyrus. He then succeeded to the provinces that had been held by Cyrus, but was unsuccessful in an attempt to establish his authority over Ionia. Finally, through the influence of Parysatis, the King's mother, Tissaphernes was put to death at Colossæ, in Phrygia, in 395 B.C.

TISSERAND, tis'tān', **FRANÇOIS FÉLIX** (1845-96). A French astronomer, born at Nuits-Saint-Georges, Côte-d'Or. In 1863 he entered the Ecole Normale Supérieure. In 1866 he became professor in the lycée at Metz, where he only remained one month, being called by Leverrier to the Paris Observatory as adjunct astronomer. He received his doctor's degree in 1868, presenting a very remarkable thesis on the method of Delaunay, which he showed to be applicable to the calculation of the inequalities of all the planets and thus of a wider application than had been supposed by the inventor. In 1873 he became director of the observatory at Toulouse and professor of astronomy in the

Faculty of Sciences in the university. In 1878 he succeeded Leverrier as member of the Academy of Sciences and became member of the Bureau des Longitudes. In the same year he was appointed professor of rational mechanics at the Sorbonne, and in 1883 was transferred to the chair of celestial mechanics. He took part in the French expeditions to Japan and Santo Domingo which observed the transit of Venus in 1874 and 1882 respectively. In 1892 he succeeded Mouchez as director of the Paris Observatory.

Besides the generalization of the method of Delaunay, which he continued till his death, he made observations for the determination of planetary orbits, on the ring of Saturn, on the perturbations of Pallas, the origin of comets and their capture by the larger planets, and gave also a valuable criterion for identifying a periodic comet. He also observed the shifting of the orbital plane of Neptune's satellite as a result of Neptune's ellipsoidal shape. In consequence of this shifting of orbit the retrograde motion of the pole of the satellite completes a cycle in 500 years. His principal work, *Traité de mécanique céleste* (4 vols., Paris, 1888-96), gives a complete account of the state of knowledge of that branch of astronomy up to the time of his death. Since 1884 he edited the *Bulletin astronomique*. He made many astronomical contributions to the *Bulletin* and to the *Comptes Rendus*, and also wrote *Recueil complémentaire d'exercices sur le calcul infinitésimal* (Paris, 1876; 2d ed., 1896). Consult Poincaré, "La vie et les travaux de F. Tisserand," in *Revue générale des sciences* (Paris, 1896).

TISSOT, tis'sō', **JAMES JOSEPH JACQUES** (1836-1902). A French painter. He was born at Nantes, studied at the Ecole des Beaux-Arts under Lamothe and Flandrin, and first exhibited in 1859. After the Commune, in which he was accused of having taken part, he lived in England for 12 years, gaining recognition as an etcher and a painter of portrait and genre subjects. Until he was 50 years old Tissot's work dealt principally with the worldly aspects of Parisian life. The drawing in these works is always careful, and the coloring exact and finished. Examples of this style are "Faust and Marguerite" (Luxembourg) and "La Femme à Paris," the latter a series of demimondaines. Experiencing a change in his religious views about 1886, he left Paris and passed 10 years in Palestine engaged upon a series of 350 studies for his "Life of Christ." The series, which was purchased by a French firm for 1,100,000 francs, is now in large part in the possession of the Brooklyn Institute Museum. It is an attempt to portray the real environment of Christ, the cities, buildings, and habits of the country, as they were in his time, based upon the supposition that Oriental life has not changed materially since then. The details are painted with miniature faithfulness. At the time of his death Tissot had begun a similar set of illustrations relating to the Old Testament.

TISSUE, ANIMAL AND PLANT. See HISTOLOGY.

TISSUE, MUSCULAR. See MUSCLE AND MUSCULAR TISSUE.

TISZA, tis'sō, **KÁLMÁN** (KOLOMAN) (1830-1902). An Hungarian statesman, born at Geszt, County of Bihar. He studied law and entered the government service. In 1855 he accepted a semiecclesiastical position in the Reformed church, and in 1859 he vigorously combated the

attempt of the Austrian Minister of Public Worship, Count Leo Thun, to curtail the autonomy of the Protestant church in Hungary. In 1861 he was elected to the Diet and soon became the recognized leader of the opposition. Long opposed to the Ausgleich, Tisza finally, in 1875, united his followers with the Deák party and organized the new Liberal party. In the Wenckheim cabinet he assumed the portfolio of the Interior (March, 1875), becoming Premier in October. He retired from the ministry in 1890, but was regularly returned as a deputy from the city of Grosswardein until 1901. Consult his biography by Visi (Budapest, 1886).

TISZA, STEPHAN (Hung. ISTVÁN), COUNT (1861-1918). A Hungarian statesman, son of Kálmán Tisza (q.v.). He was born at Budapest, and was educated at the universities of Berlin, Heidelberg, and Budapest. He entered the Hungarian Ministry of the Interior in 1882 and in 1886 became a member of the Hungarian Parliament. In politics Tisza became one of the strongest supporters of the agreement and economic union with Austria. In 1898 he was instrumental in obtaining the passage of the Tisza law for the purpose of breaking up the policy of obstruction against the Bánffy cabinet. (See BÁNFFY, D.) As the leader of the Liberal party Tisza became Premier and Minister of the Interior in 1903, but was dismissed in 1906. At the same time he lost his seat in Parliament. He returned to power as Premier on June 9, 1913, holding office during crucial months of the European War. He opposed the proposed German plan of establishing a customs union and economic federation between the Central Powers and their allies. See HUNGARY.

TITAN. See TITANUS.

TITANIA. 1. An epithet of Latona, as the daughter of the Titan Cœus. Ovid uses the name for Diana and for Pyrrha, daughter of Epimetheus. 2. In Shakespeare's *Midsummer Night's Dream*, the fairy queen, wife of Oberon.

TITANIA. See URANUS.

TITANIC DISASTER. The Royal Mail steamship *Titanic* of the White Star Line, sailing on her maiden voyage from Southampton to New York with 2223 passengers and crew, was lost at sea by collision with an iceberg on the night of Sunday, April 14, 1912, and 832 passengers and 685 of the crew perished. Among those lost were John Jacob Astor, Archibald W. Butt, F. D. Millet, William T. Stead, and Isidor Straus (qq.v.). The *Titanic* was the largest ship in the world at the time, with dimensions: length, 852.5 feet; beam, 92.5 feet; depth, 73 feet 3 inches; draft, 34 feet 7 inches; gross tonnage, 46,328; net registered tons, 21,631; speed, 21 knots per hour. See SAFETY AT SEA.

TITANIC IRON ORE. See ILMENITE.

TITANITE (from *titanium*). A calcium titanate-silicate which crystallizes in the monoclinic system. It has a resinous lustre, and is brown or black in color. It usually occurs in crystals embedded in granite, gneiss, mica schists, granular limestone, or in beds of iron ore and volcanic rocks. It is found in the St. Gotthard region, in Switzerland, Finland, and Ireland. In the United States it occurs in numerous localities along the Appalachian Mountains from Maine to North Carolina. The brown or black varieties are often called lederite in distinction from the lighter colored titanite called sphene. The latter transparent and colorless varieties are frequently cut as gem stones.

TITANIUM (Neo-Lat., from Lat. *Titan*, from Gk. *Τίτις*, Titan). A metallic element discovered by Gregor in 1789. It is not found native, but as the oxide in the minerals anatase, brookite, and rutile; in combination with iron as ilmenite, and as the silicate with calcium in titanite. In smaller quantities it also occurs in other minerals. It may be prepared by heating the potassium titanofluoride (obtained from rutile) with potassium or sodium out of contact with air. In 1910 Hunter obtained titanium in a state of high purity by heating titanium tetrachloride with sodium.

Titanium (symbol, Ti; atomic weight, 48.1) is a steel-like metal that melts at about 1825° C. (above 3300° F.). Its specific gravity is 4.5. When heated to redness in the air it burns with an intensely brilliant white light. It can be dissolved in sulphuric, hydrochloric, or nitric acid. Metallic titanium readily unites with nitrogen at high temperatures. Titanium gives hardness and toughness to steel and a fine lustre to silver, while added to carbon used for arc lamps, it increases the brilliancy of the light. Titanium is also used for making filaments for incandescent lamps; its compounds have been recommended as excellent ingredients of paint for the protection of iron from the air; and, finally, titanium salts are at present used to a considerable extent in dyeing. The element combines with oxygen to form a monoxide, TiO, a dioxide, TiO₂, a trioxide, TiO₃, and a sesquioxide Ti₂O₃. Of these, the dioxide is found native and combines with bases to form titanates.

TITANOSAURUS, or ATLANTOSAURUS. A genus of extinct, sauropodous, herbivorous dinosaurs (q.v.), found fossil in the Jurassic rocks of the Rocky Mountain region and Dakota, whose species were among the most gigantic land animals that ever existed, one specimen, exhumed in Colorado by O. C. Marsh, measuring about 60 feet long and standing about 30 feet high. The characteristics of the genus were similar to those of its near relatives *Brontosaurus* and *Diplodocus* (qq.v.).

TITANOTHERIUM (Neo-Lat., from Gk. *Τίτις*, Titan + *θηρ*, *thērion*, dimin. of *θήρ*, *thēr*, wild beast). The type genus of a family, Titanotheridae, of ungulates, occurring in the Oligocene formations of North America, and comprising a number of species of gigantic animals somewhat resembling the rhinoceros in general form. Though belonging to the perissodactyls, they approximate the artiodactyls or even-toed ungulates in certain structural points, especially of the vertebrae and limb bones. The most striking feature of the titanotheres is a pair of bony processes resembling horn cores, which grow upward and outward from the maxillary bones above the snout. These prominences are variable in development according to age and sex, and also differ in size and form in different species to such an extent that many generic names, such as *Menodus*, *Brontotherium*, *Brontops*, and *Titanops*, have been bestowed upon forms which later study has shown to be only different stages in the evolution of the same genus. Careful comparative study of the remains from the White River beds of Canada, South Dakota, Colorado, and Nebraska shows that during the Oligocene period the genus increased in size, and the horns, which are mere knobs in the (presumably) earlier types, such as *Titanotherium heloceras*, increased greatly in

length, and became flattened and wide spreading in the later species, culminating in the highly specialized *Titanotherium ramosum* and *Titanotherium platyceras*—the last survivors of their race. Of some 40 specific names which various writers have proposed, often on the

A. B. Cook, "Zeus, God of the Bright Sky," in *Zeus, a Study in Greek Religion*, vol. i (Cambridge, 1914).

TITCHENER, tich'e-nār, EDWARD BRADFORD (1867–). An American psychologist, born at Chichester, England. He was educated at Malvern College and at Brasenose College, Oxford, where he graduated B.A., in 1890; in 1906 he received the degree of D.Sc. from Oxford. After taking his Ph.D. at Leipzig, he became assistant professor of psychology (1892) at Cornell University and subsequently professor (1895) and research professor (1910). At Cornell he brought the laboratory of experimental psychology to a point of great efficiency. He made numerous original investigations in the fields of sensation, affective process, attention, and action. Harvard, Clark, and Wisconsin universities gave him honorary degrees. He wrote: *An Outline of Psychology* (1896; new ed., 1902); *A*

Primer of Psychology (1898; rev. ed., 1903); *Experimental Psychology* (4 vols., 1901–05); *Elementary Psychology of Feeling and Attention* (1908); *Experimental Psychology of the Thought Processes* (1909); *A Textbook of Psychology* (2 vols., 1909–10); *A Beginner's Psychology* (1915). He translated Külpe's *Outlines of Psychology* and other works, became the American editor of *Mind* in 1894, and associate editor of the *American Journal of Psychology* in 1895, and contributed to the NEW INTERNATIONAL ENCYCLOPÆDIA.

TIT'COMB, TIMOTHY. A nom de plume used by J. G. Holland (q.v.).

TITE, SIR WILLIAM (1798–1873). An English architect. He was born in London, where he was educated, and studied architecture under David Laing. His first work, assisting in rebuilding the church of St. Dunstan-in-the-East in the Gothic style (1817–20), established his fame. Among his best designs was that of Edward Irving's church in Regent Square, London (1827–28), and he was the architect of the Royal Exchange (1841–44), and of several palatial railway stations in France and England. From 1855 until his death he sat in Parliament for Bath. He was knighted in 1869. He was a man of varied attainments, a member of several learned societies, and published *A Catalogue and Description of the Antiquities Found in the Excavations for the Royal Exchange* (1848), and several essays and lectures.

TITHES (AS. *tēopa*, a tenth part, from *tēon*, *tien*, *tyn*, ten, Goth. *taihun*, OHG. *zehan*, Ger. *zehn*, ten). A tenth part of the produce of the land, which has from early times been a common rate in systems of taxation for civil and religious purposes. Tithing is still the prevailing method of taxation in Mohammedan countries. It was established and definitely regulated for the support of religion among the Hebrews. For the details of the Hebraic institution of tithes see Lev. xxvii, Num. xviii, and

EVOLUTION OF THE TITANOTHERES.

1, skull of *Titanotherium bucco*; 2, cranium of *Titanotherium coloradense*; 3, front view of cranium of *Titanotherium platyceras*; 4, lateral view of same. (Osborn.)

basis of a single fragmentary skull, only a few designate sharply marked species. One of the best-known titanotheres is *Titanotherium robustum*, a form with moderately developed horns, which measured nearly 14 feet in total length, and 8 feet in height at the shoulder.

TIT'ANS (Lat., from Gk. *Titán*, *Titan*, and *Titavís*, *Titanis*). The offspring in Greek mythology of Uranus (Heaven) and Gæa (Earth). Their names as given by Hesiod were: Oceanus, Cæus, Crius, Hyperion, Iapetus, Cronos, Theia, Rhea, Themis, Mnemosyne, Phœbe, and Tethys. Dione, Phoreys, and Demeter are added by some writers. As Uranus imprisoned in the earth the Cyclopes and Hekatoncheires (100-handed monsters), Gæa in anger instigated the Titans to revenge. Cronos alone ventured to act. He surprised and mutilated his father and reigned in his stead. As Uranus had called down a like fate on the Titans, Cronos swallowed his children by Rhea as soon as they were born. Only Zeus escaped, his mother giving Cronos a stone wrapped in swaddling clothes. Later, Zeus forced Cronos to disgorge his offspring, and then began a war, in which he was aided by Themis, Mnemosyne, Styx, Prometheus, the Cyclopes and Hekatoncheires, as well as by his brothers and sisters. Iapetus and Cronos are the representative Titans. After a long struggle the conquered Titans were cast into Tartarus and guarded by the Hekatoncheires. In the *Prometheus Unbound*, Æschylus represented the Titans as released and reconciled to Zeus, now firmly established as King of Heaven. The name Titan is given also to the descendants of the Titans, Prometheus, Hecate, Helios, Selene, etc. Consult: Maximilian Mayer, *Die Giganten und Titanen in der antiken Sage und Kunst* (Berlin, 1887); Otto Gruppe, *Griechische Mythologie und Religionsgeschichte*, 2 vols. (Munich, 1906); J. E. Harrison, *Prolegomena to Greek Religion* (2d ed., Cambridge, 1908); C. M. Gayley, *The Classic Myths in English Literature and in Art* (2d ed., Boston, 1911);

Deut. xiv, where it is provided that the tribe of Levi, not having lands assigned to them as was the case with the other tribes, should draw their support from this system of taxation.

In the usage of the Christian churches tithes have been one of the methods employed in providing for the support of the clergy. (See STIPENDS, CLERICAL.) The system was urged as of moral obligation by the Apostolic canons, the Apostolic constitutions, and the writings of the Fathers, on the ground that the Christian priesthood continued that of the Old Testament. Many Church councils in the sixth, seventh, and eighth centuries confirmed the system; and at length the Emperor Charlemagne, by his capitularies at the beginning of the ninth century, formally established the tax within that portion of the ancient Roman Empire to which his legislation extended.

The introduction of tithes into England is ascribed to Offa, King of Mercia, at the end of the eighth century; and the practice was made general for all England by Ethelwulf, about the year 850. It would seem that at first, although all were required to pay tithes, it was optional with each to select the church to which payment should be made; but by a decretal of Pope Innocent III, addressed to the Archbishop of Canterbury in the year 1200, all were required to pay tithes for the support of the clergy of their respective parishes, and this parochial distribution of tithes has ever since obtained in England. Consult: B. Whitehead, *Church Law: Dictionary of the Statutes* (London, 1892); W. Easterby, *The History of the Law of Tithes in England* (Cambridge, 1888); R. Palmer (Lord Selborne), *Ancient Facts and Fictions Concerning Churches and Tithes* (2d ed., London, 1892); H. W. Clark, *A History of Tithes* (2d ed., ib., 1894); H. Lansdell, *The Sacred Tenth, Ancient and Modern* (ib., 1906). See CHURCH RATES.

TITHING. A territorial or personal division in early English history. The territorial tithing, a tenth part of the hundred (q.v.), dates from early Anglo-Saxon times. The personal tithing probably came in with the Normans, though many give it a place in Anglo-Saxon polity. It consisted of 10 men mutually responsible for one another, with a head pledge or tithing man to represent the whole. (See FRANKPLEDGE.) This officer survived as a petty parish official long after the system to which he owed his origin had decayed.

TITHONUS (Lat., from Gk. *Tithonós*). In Greek legend, a son of Laomedon and brother of Priam, who was carried off by Eos (the Dawn). (See AURORA.) She bore him Memnon, and obtained from the gods for him the gift of immortality. The Homeric hymn to Aphrodite adds that, since Eos forgot to ask for eternal youth, Tithonus withered into helpless old age, remaining behind closed doors, only his piping voice heard. A late account told of his final transformation into a cicada.

TITIAN, tish'ón (It., Tiziano Vecelli or Vecellio) (1477-1576). The most celebrated and important painter of the Renaissance in Venice, and one of the greatest painters of all times. He was born at Pieve di Cadore, a small town in the Alps of Friuli. The year of his birth has been variously given, the most probable assumption (1477) being based upon his own statement in a letter to Philip II of Spain. His family, the Vecelli, belonged to

the petty nobility, and had long been identified with the public service in Pieve, Titian's father, Gregorio, being honorably known as a magistrate and military commander. At nine the lad was sent to Venice in care of an uncle who lived there. He was first apprenticed to the mosaicist Sebastiano Zuccato, then to Gentile and Giovanni Bellini, having Giorgione and Palma Vecchio as fellow pupils. His development was slow and while Giorgione lived, he was content to follow in his footsteps. His work also had much in common with that of Palma Vecchio, but in this case Titian was probably the controlling influence.

During the first part of Titian's early period, lasting till 1512, his style resembles that of Giorgione, except that it is more rugged and the lines and colors are not so soft and melting. To this early period belong a "Madonna with Saints" (Liechtenstein collection, Vienna); a "Holy Family" (National Gallery, London); and the so-called "Gypsy Madonna" (Imperial Gallery, Vienna). They show uncertainty of drawing, but much charm of color. The first of his pictures that can with surety be dated is "Pope Alexander VI Commending Jacopo Pesaro to the Madonna" (1502-03, Antwerp). A higher phase of technical development is shown by the "Madonna with the Cherries" (Imperial Gallery, Vienna), and the Madonnas with Saints at Dresden, Paris, Florence (Uffizi), and London (National Gallery). The "Concert," in the Pitti Palace, Florence (see GIORGIONE), has been attributed to him and the "Tribute Money" (Dresden), representing the incident between Christ and the Pharisee, is the most carefully finished of his pictures. Only Leonardo has created a Christ type that can vie with this in gentleness, intellectuality, and majesty, and the contrast between it and the cunning coarseness of the Pharisee is especially striking. The Uffizi also possesses his "Daughter of Herodias," for whom Titian's daughter sat as model. Other celebrated works are the beautiful allegory of the "Three Ages" (Bridgewater Gallery, London), and at the end of the period, summing up its best qualities, is "Sacred and Profane Love," more properly called "Medea and Venus," a remarkable contrast of the nude and vested figure in a beautiful sunny landscape.

The façade frescoes of the Fondaco dei Tedeschi (1507-08), which Titian executed as an assistant of Giorgione, have perished, but of those in Padua several survive, though not well preserved. One is in the Scuola del Carmine, and in the Scuola del Santo he depicted three miracles from the life of St. Anthony (1511). It was probably after his return to Venice in 1512 that he painted the well-known altarpiece of Santa Maria della Salute, representing "St. Mark Enthroned" with four other saints.

In 1513 Titian was summoned to Rome by Pope Leo X, but, preferring to remain at Venice, he petitioned the Senate to grant him a position like that of Giovanni Bellini, who was official painter to the state, and a commission to paint a large battle piece in the Hall of the Grand Council. This petition was granted, but when, upon the death of Bellini, Titian was named his successor, with a yearly pension of 300 crowns, he neglected the promised battle piece. He did, however, complete Bellini's picture, the "Submission of Barbarossa," in 1522, and executed a series of frescoes in the chapel of the Ducal Palace—both of which were de-

*

TITIAN

"THE TRIBUTE MONEY," FROM THE PAINTING IN THE ROYAL GALLERY, DRESDEN

stroyed in the great fire of 1577, but his fresco of "St. Christopher" (1523) still survives.

The work executed between 1513 and 1530 may be classed as belonging to a second part of Titian's early period. It still shows reminiscences of Giorgione, but also an increasing realism, breadth of treatment, and mastery of color. To this period belong most of his great altarpieces, beginning with the "Assumption of the Virgin" (1518), formerly the high altarpiece of the church of the Frari. Its position called for an over life-size figure and great breadth of treatment, the effects of which are lost in the present position of the picture in the Venetian Academy. The lower part is a scene of great exaltation among a group of the Apostles, the figures of Peter and John being particularly strong. Above the Virgin rises to the heavens in an effulgence of golden light, surrounded by hosts of the most beautiful angels imaginable. Another fine example is the Madonna painted for San Niccolò dei Frari (1523, Vatican Gallery), but the most perfect and important of his madonnas is probably the "Pesaro Madonna" (1526), still in the Frari. This very original composition represents the Madonna seated on the side of the picture at the base of a mighty column, where several saints commend to her the members of the Pesaro family. The celebrated "Death of Peter Martyr" (1530), destroyed by fire in 1867, survives only in an engraving. To the same period, probably, belong the "Noli me tangere" (Christ appearing to Magdalen), with marvelous balance of sentiment in figure and landscape, in the National Gallery, London, the delightful "Madonna with the Rabbit," "Holy Family," and the grandly dramatic "Entombment"—all in the Louvre.

Among Titian's mythological pictures of this period, chiefly painted for Alfonso, Duke of Ferrara, are the "Worship of Venus," in which numberless little Cupids disport themselves before a statue of Venus, a "Bacchanal" (both at Madrid), and "Bacchus and Ariadne" (National Gallery, London), a highly dramatic representation of fine coloristic quality. As state painter he had the monopoly of portraying the Doge. His official portraits perished in the fire of 1577, but many replicas survive, like that of the Doge Gritti (Czernin collection, Vienna). He found also a generous patron in Alfonso d'Este, Duke of Ferrara, whose reputed portrait, lately declared to be that of his son, Ercole II, is at Madrid. At Ferrara is a fine likeness of the poet Ariosto (National Gallery), now, however, properly attributed to Palma Vecchio, and there also is the idealized portrait widely known as "Alfonso d'Este and Laura Dianti" (Louvre), erroneously called "Titian's Mistress." The same model is portrayed in the "Flora" (Uffizi) with wonderful effect of light draperies. Other celebrated portraits belonging to this period are the "Young Man with a Glove" (Louvre), the portrait of an unknown man (Munich), and the so-called "Alessandro de' Medici" (Hampton Court).

The death of his wife, Cecilia, in 1530 was the cause of change in Titian's mode of life. In the quiet northeastern quarter of Venice he purchased a house which he furnished with great magnificence, and which speedily became the centre of a famous literary and artistic circle, which even kings joined when visiting Venice. In painting, his treatment grew broader and his

work more powerful, and while his ideals grew more sensuous and realistic, it was a gracious and dignified sensuality. In 1531 he painted in the Ducal Palace the celebrated picture of the "Doge Andrea Gritti Presented to the Virgin by St. Mark," and in 1537 he at length finished the great battle piece of Cadore, both destroyed in the fire of 1577. The celebrated "La fede" (1555), a votive offering of Doge Andrea Grimani, had a better fate. Other decorative works are the ceiling of the choir and sacristy of Santa Maria della Salute, and the wonderful figure of "Wisdom," on the ceiling of the library of St. Mark (now the Royal Palace). Splendid decorative canvases of unusual size are the "Presentation of the Virgin in the Temple" (Venetian Academy) and the realistic "Ecce Homo" (Vienna).

In 1532 he was summoned to Bologna to portray Charles V and performed his task with such success that he was named court painter, Knight of the Golden Spur, and Count Palatine, with the privileges of the Spanish court, and his children were made nobles of the Empire. One of these portraits of the Emperor (1533) is at Madrid. Other celebrated portraits of this period are those of Ippolito de' Medici (Pitti Palace, Florence), the "Maltese Knight" (Madrid), and the so-called "Young Englishman" (Uffizi). Very fruitful for Titian's art were his relations (1532-38) with the Duke of Urbino, whose portrait in full armor, as well as that of his wife, Eleanora Gonzaga, is in the Uffizi. With subtle flattery he portrayed the lady's rejuvenated features in the celebrated "La bella di Tiziano," perhaps his finest female portrait, in the "Girl with a Fur Cloak" (Vienna), and in the "Venus of Urbino" (Uffizi), a rival of Giorgione's Venus, and the most beautiful representation of refined voluptuousness in modern painting. In 1545, after invitations from the Pope, Titian visited Rome, where he was received with highest honors. Of his portraits of Paul III an original is at St. Petersburg and an excellent copy in the Naples Museum, which also possesses the splendid psychological study of the Pope and his two nephews. At Rome he met Michelangelo, whose influence may perhaps be seen in the "Danaë" (Madrid) painted there. Other famous works executed about this time are the realistic "Venus," with the features of his daughter Lavinia (Uffizi), and a similar figure listening to music, at Madrid.

In 1548 Titian was summoned by Emperor Charles V to Augsburg, and there he painted that ruler's equestrian portrait in full armor (Madrid)—a wonderful characterization of the irresistible but disappointed master of Europe and the New World. Another portrait of Charles V (1548), in black costume seated in a loggia, is at Munich. At the same time Titian portrayed the captive John Frederick, Duke of Saxony (Vienna), and Cardinal Granvella (Besançon). He enjoyed the intimate friendship of the world-weary Charles V, and together they designed the "Trinity," the Emperor's last commission. After Charles's death Titian continued to serve his son Philip II, whom he portrayed repeatedly, as in the excellent example in possession of Mrs. T. J. Emery, Cincinnati.

It is impossible to mention even the important works of Titian during the last period of his long career (1530-76). Among religious pictures some of the most celebrated are a "Magda-

len" (Pitti Palace); a "Madonna with St. John and Catharine" (National Gallery), celebrated for the landscape; "Christ at Emmaus" (Louvre); "St. Margaret"; and several others at Madrid. His mythological subjects include the celebrated "Venus and Cupid" (Borghese Gallery, Rome), "Jupiter and Antiope" (Louvre), and "Rape of Europa" (Gardner collection, Boston). Of his innumerable portraits we mention only those of his beloved daughter Lavinia, with a dish of fruit (Berlin), and as a bride and a matron (both at Dresden); of himself at Berlin, Vienna, Florence, and Madrid; his friend Aretino (1545, Pitti); Doctor Parma and the antiquarian Strada, in Vienna; and the splendid Cornaro family (Duke of Northumberland).

Titian's last pictures were chiefly religious, like the "Saviour of the World" (St. Petersburg) and the grand "Pietà" (Academy, Venice), finished after his death by Palma Giovane. In his hundredth year he was stricken by the plague, Aug. 17, 1576. He was buried in the Frari Church, where a fine modern monument marks his resting place. His son Orazio, an able painter and his faithful assistant, soon followed him. For Titian's important pupils, see PAINTING; TINTORETTO.
